Smaller, rural sites, like the settlement at Lago dell'Accesa, document more mixed activities.²⁶⁵⁵ According to Giovannangelo Camporeale, the economy of the settlement at Lago dell'Accesa was based on mining local ores in combination with subsistence activities. Hunting, fishing and agriculture are recorded by the implements that were recovered. Thus, meals could be supplemented with game and fish.²⁶⁵⁶ On account of the quantity of weaving tools and the low degree of specialization reflected in the pottery, it is suggested that women were involved in domestic activities, weaving, and the production of household ceramics. The reconstruction of the local economy is one of part-time specialization.²⁶⁵⁷ The buildings and the associated finds, however, denote relatively comfortable living circumstances for a number of families who combined mining with a range of other activities.

7Organization of labor

The upper classes of Etruria expanded their control over labor. For example, their monumental burial mounds signify an increase in corvée labor since it required the displacement of massive amounts of soil. By 580 around 5% of the people in Etruria might have controlled a substantial part of the wealth of their group/clan.²⁶⁵⁸ It appears that elite families were generally in charge of organizing labor, and each of these families was dominated by a powerful lineage that claimed an ancestry stretching into the remote past. However, the majority of the population obviously was not counted among the elite. For the remaining 95% of the population, labor was split as follows: 90% farming; 5–10% crafts; 2–5% services in administration, religion, trade and personal care.²⁶⁵⁹ When compared to the percentages given for the Iron Age (see chapter 43 Nijboer), one can detect a gradual shift. As mentioned before,

agriculture remained at the heart of the economy even if it was exploited and controlled more firmly than around 750. Since the economy remained farm-based, socioeconomic transformations were relatively slow. It is assessed that between 5 to 10% of the people were involved in mining and producing metal and ceramic commodities as well as specialist goods like particular textiles, ivory vessels, gold and silver jewelry, and other craft-artifacts that employed a wide range of local and imported raw materials. Most of the goods used for daily life could still be made in individual households during quieter periods of seasonal farm labor. Spinning and weaving tools in houses indicate that the majority of the households remained involved in textile production. This might also be valid for other objects such as basic furniture and basketry.

Services included a small group for administration and trade, a few professional patrollers or soldiers and some personal attendants. Troops, whenever required, would have been largely made up of conscript clients whose main activities were agricultural. Musicians pertain to a special group that comes to the fore. New musical instruments became available, some of which have been actually excavated.²⁶⁶⁰ Depictions of musicians with instruments such as flutes, horns, trumpets and zithers suggest that music accompanied fairs, symposia, processions, battles and dances.²⁶⁶¹ The nature and the number of occasions implies that in the major centers of Etruria, companies of musicians might have existed from the late seventh century onwards, providing their services whenever requested.

8 Customary and luxury goods

It was mainly the conspicuous consumption of the elite—as observed in their tombs—that caused ongoing craft specialization during the Early Orientalizing period. The treasures found in elite tombs indicate close contacts and long-distance exchange between the upper classes in Etruria.²⁶⁶² Chariots and seaworthy ships form an exclusive group of costly products, the construction of which required explicit knowledge of building techniques, a substantial team of workman, supervisors and considerable resources. As such, they document the high standing of economic organization feasible in Etruria during the Late Orientalizing period.

The manufacture of ordinary or low-value goods in workshops also developed significantly. Ceramic tiles have already been discussed, above. Another group of standardized goods are the Etruscan transport amphorae. A detailed account of their manufacture would, indeed, be interesting because they record economic arrangements that are administered.²⁶⁶³ Unfortunately this aspect is still difficult to examine due to a lack of excavated production sites of Etruscan transport amphorae, inscriptions, homogenous fabrics and standard measurements. Especially the early Etruscan amphorae types are not

standardized.²⁶⁶⁴ They are labeled Etruscan amphorae because their manufacture cannot be attributed to specific sites in Etruria though Vulci and Caere are frequently implicated as major production centers.²⁶⁶⁵ Elite families seem to have been in control of their manufacture and of the collection of the processed crops and wine that were to be transported in them.²⁶⁶⁶ Therefore it seems that exchange, even of the agricultural, surplus production, was directed by the elite, as was the trade of luxury goods. By managing labor and exchange, the elite's hold on the increasingly more complex economy of Etruria had become considerable.

9Appropriation of wealth

The recurring theme of this chapter is that stable progress in production and demand in all its aspects, encouraged socioeconomic complexity. The economy became more differentiated while being controlled by an upper class that expanded their grip on daily life of those who depended on them. In comparison to other early civilizations, however, Etruria seems to lack economic appropriation by institutions. In most ancient civilizations, various institutions—like kings and sanctuaries—existed that actually owned large tracts of land.²⁶⁶⁷ Both are present in Etruria during the Orientalizing period but appear to develop weakly, probably due to the prevailing clan structure of society that resulted in patrician and eventually oligarchic arrangements. Institutions seem to have depended on these elite families and did not become economically independent. They could not appropriate enough resources to erect themselves as state institutions lasting monumental palaces and temples. Clans with their main lineages and leaders seem to have dominated socioeconomic conditions. Each key center housed several of these elite families, who managed to divide the available resources and their surplus yield. The appropriation of wealth in Etruria is primarily recorded for the upper class, or those who were striving to join them, and not by institutions.

The above sections illustrate that the privileged classes in Etruria managed to control surplus production more effectively and on a larger scale than ever before, eventually to such an extent that they could participate in an overseas long-distance trading network. The export of commodities from Etruria reflects the effective control over surplus production.²⁶⁶⁸ This scenario proves that the elite registered and directed overseas trade, partially by the establishment of *emporia*. In addition, overland exchange between the various centers remained essential and was managed by the upper classes as well, judging from the wealth deposited in a number of tombs at some secondary sites that were located at key positions within this trading network.

10 Conclusion and discussion

In this chapter a divide was presented between the economies of:

1. The Early and Middle Orientalizing periods: 730–640/630 and
2. The Late Orientalizing period: 640/630–580.

The gradual shift between this divide is exemplified by the transition from huts to houses from around 640/630 onwards but can also be illustrated with some stylistic resemblances between ivory, gold and silver vessels from central Italy and beyond with their bucchero/ceramic counterparts. All vessels can be roughly dated to the first half of the seventh century. For most sites, the imitation of luxury goods in more common materials is recorded.

The increasing exploitation of available resources developed gradually, starting from patterns that became established during the eighth century. The economy remained largely landlocked though maritime trade was briefly explored, flourishing between 625 and 500.

The scale and differentiation of the economy in Etruria grew significantly. This is best reflected in the size and hierarchy of the settlements. Surveys have shown that the countryside around major Etruscan centers became more and more inhabited. Hierarchies of craft workers evolved as well with main differences between primary, secondary and tertiary settlements. Specialization was most advanced in the capitals of the rising city-states. For example, the demand for ceramics during the late seventh century probably established early nucleation of pottery workshops at key centers such as Veii, Caere, Tarquinia, Vulci, and Vetulonia. Nucleation of workshops encouraged full-time craft specialization in the main centers of power, and at some secondary sites as well, but not to the same extent.

Market conditions were more developed in the *emporia* along the coast for the management of exchange with overseas traders. Most domestic exchange was probably still by barter and took place within clans. Patron-client relations caused unbalanced reciprocity. Many farmers lived in or near the key centers. It is evident that they acquired progressively more products from workshops, which reflected growing interior markets. This is confirmed by the surveys in the hinterland of Caere, where various products from workshops were recovered in a rural setting.²⁶⁶⁹

Uncertainties remain about the economic role of war and of emerging institutions. It is probable that ongoing economic growth created opportunities for many and that enduring warfare was absent to some extent as long as the surrounding hinterland was not fully exploited and dominated. Institutions did expand during the late Orientalizing period, mainly in the form of elite practices, sanctuaries and trading settlements, but it seems that institutions were unable to appropriate economic resources themselves. Warfare, sanctuaries and trade were predominantly run by the leaders of various elite families, preventing the firm establishment of one lasting royal lineage per

city-state. These topics, however, fall outside the scope of this chapter.

Another issue that calls for a better understanding is internal exchange or domestic markets. How was trade in the “*better quality, mass-produced commodities*” organized in the rising city-states of Etruria? Specialization and more complex forms of production enhance socioeconomic interdependence. In addition, workshops ultimately require measures of weight and volume, units that are accountable. These units are so far hardly found in Etruria during the Orientalizing period. This implies that domestic markets were still poorly developed. Nonetheless, the resulting more complex levels of organization strengthened the position of the upper class, who were clearly in control of labor and thus the economic developments in Etruria.

50 External Relationships, 730–580 BCE

Abstract: The Orientalizing phenomenon bases itself on the Etruscans' openness towards external influences. More than ever before, Etruria entered into a wider Mediterranean context of the circulation of goods, people and ideas, as well as relations with the Near East and Greece.

Furthermore, the extraordinary flourishing of Orientalizing Etruria became a point of reference for all regions of the peninsula and continental Europe where social hierarchization was beginning to arise. Almost all the Italic populations (the neighboring Latins, Falisci, Capenates, Sabines and Umbrians, the Picenians, the northern cultures of Golasecca and Este and indigenous centers of southern Italy), as well as those in continental Europe, received precious Etruscan status symbols for the local aristocracies. Through the Etruscans they also took Greek cultural models, like the centrality of the symposium, or the aristocratic ideal of war as a struggle between individual heroes riding on chariots. The cultural contacts were also favored by the movement of Etruscan people, responsible for the initiation of local artisan workshops as well as for the transmission of writing in many Italic areas. These relations were not unilateral: grave goods and epigraphy also show that the Etruscans received foreign objects and people.

This chapter presents a brief overview of these relationships and tries to highlight constant themes as well as differences.

Keywords: Relationship; Etruria; Italic populations; Etruscans and Europe

Introduction

The Orientalizing phenomenon was based on the Etruscans' openness to external influences within a wider Mediterranean context of the circulation of goods, people, and ideas. Near Eastern and Greek influences accelerated and shaped the processes of economic and social change that had begun to take place in Etruscan society already at end of the Early Iron Age.

Studies in recent decades have clearly established how the reception of external stimuli operated through a process of selection and creative reelaboration, attributing an ever more autonomous and increasingly active role to the Etruscans in the dialectic between the different ethno-cultural components.²⁶⁷⁰

Reevaluating the Etruscans' role also sheds new light on asymmetries that existed between Tyrrhenian cities in the acculturation process, with discontinuities linked to the establishment of preferential relations with various Greek components competing for the conquest of Western markets. At this point in time, some structural dynamics emerged that would affect the

subsequent course of Tyrrhenian history up through the crisis of the fifth century BCE.

1The Eastern Mediterranean

Until recently, research unequivocally interpreted the presence of Etruscan goods in Hellenic sanctuaries as offerings from Greeks returning from the Italian peninsula. Current studies argue that these goods are linked to aristocratic gift-giving and reflect the Etruscan communities' desire to assert themselves internationally.²⁶⁷¹

Between the late eighth and seventh centuries, such offerings are mostly represented by valuable bronze objects (helmets, shields, vases and thrones) identified in Etruria as symbols of rank (see [chapter 46](#) Micozzi). When such objects appear in the Italian peninsula or Transalpine Europe far from their production sites, they are universally interpreted as indicators of an Etruscan presence, or as ceremonial gifts with commercial implications. Their presence in Hellenic sanctuaries could thus correspond to the same logic of self-representation transferred into a sacred sphere and associated with the attendance at those sanctuaries by Etruscans or their intermediaries.

Studies from recent decades have shifted focus from the movement of commodities to the movement of people. On the basis of the proliferation of many handcraft activities (see [chapter 46](#) Micozzi), Near Eastern craftsmen seem to have had an extensive presence in Etruria, but, based on present knowledge, they do not seem to have left epigraphic or literary traces comparable to those of the Greeks. Certain Greeks in Etruria came directly from the upper (most probably literate) classes, as attested by Rutile Hipocrates of the Tumulus of the King in Tarquinia ([Fig. 47.2a](#)), and by Demaratus, who moved to Tarquinia in the first half of the seventh century, when the city became immersed in a cultural climate undoubtedly linked to Corinth.

2The Italian peninsula

The directions of Etruscan expansion into Campania, Emilia Romagna, and the central Adriatic coast (Fermo) indicate that, by the Early Iron Age, there was a broad interest in different parts of the peninsula. This is substantiated by Cato's (Serv. 11.567) and Livy's (1.2.5.33) assertions about the important role Etruscans played in pre-Roman Italy.

In the seventh century, the extraordinary flourishing of Orientalizing Etruria was unmatched elsewhere in the western Mediterranean and became a point of reference for all regions of the peninsula and continental Europe, where

social hierarchization was beginning to arise.

2.1 The neighboring populations: Latins, Faliscans, Capenates, Sabines and Umbrians

Relations with neighboring populations were characterized by mutual horizontal mobility—also documented in onomastics²⁶⁷²—and by zones of cultural osmosis in border areas.

The Faliscan and Capenate areas, already connected to Etruria by ancient tradition, together with Caere and Veii shaped a district with strong cultural ties that are evidenced by the circulation of vases, embossed bronzes, and other precious artifacts found in the grave goods emerging from Narce and Faleri (see [chapter 46](#) Micozzi). These relations involved people moving, for example, from Etruria to Narce, where Etruscophones were integrated into the local community,²⁶⁷³ ([Fig. 17.2](#)) and perhaps in the opposite direction, judging from the existence of Narce-style loculus tombs in the Caeretan necropolis of Poggio dell'Asino.²⁶⁷⁴

Veii, the Etruscan outpost on the Tiber, played a key role in relations between southern Etruria and Latin-speaking populations. Already at an advanced stage of the Early Iron Age, tombs of warriors appear in Latium (at Osteria dell'Osa, Decima, Rome and Velletri), distinguished by the presence of weapons and other rich grave goods clearly attributable to people of Etruscan origin, and probably from Veii, who were fully integrated into local society (see [chapter 79](#) Naso).²⁶⁷⁵

In the seventh century, some centers on the Latin side of the Tiber (Crustumium, Fidenae, Nomentum and Acqua Acetosa Laurentina) had mixed cultures, with evident Etruscan elements, but also Faliscan, Capenate and Sabine influences. Due to its strategic position, Crustumerium, a border town notably linked to Etruria by Pliny (*HN*52) and Festus (Paul. Fest., p. 55.12 L.) and which Plutarch defined as Sabine (*Rom.* 17.1), acted as a pole of attraction for different cultural components and certainly had contact with Etruscan people from Veii and Caere.²⁶⁷⁶

Fig. 50.1: Pyxis in “white-on-red” ware from Crustumerium, Monte del Bufalo, Tomb HI (after De Puma 2010)

This phenomenon regards both funerary architecture, dominated by the Veientan-Faliscan loculus type, and material culture. The latter distinguished itself, among other things, through the presence of a large group of red impasto vases with white-on-red decoration (Fig. 50.1), a decorative technique scarcely represented in Latium, but characteristic of the Caeretan and Faliscan territories. Alongside apparently imported examples, there are clearly recognizable local products, which have parallels in the Faliscan, Capenate and Veientan areas both through the morphological repertoire and through the decoration—largely modeled on that of incised and excised impasto vases. Yet these local products also refer to Caere in their adoption of the pyxis form and the figurative decoration of certain examples.²⁶⁷⁷

Relations between Caere and Latium are also well documented by gold work and other precious objects from Caeretan workshops found in certain tombs of Latium vetus (see chapters 46 Micozzi and 79 Naso). In particular, the tombs of Praeneste’s principes adhere to an Etruscan Orientalizing lifestyle and, combined with the widely discussed *vetusia* inscription from the Bernardini Tomb,²⁶⁷⁸ could suggest that the deceased were Etruscan. These tombs are certainly some of the best demonstrations of the relations between ruling classes involving the movement of luxury goods through the practice of

ceremonial gift-giving. From the Late Orientalizing period, this practice can be seen in religious spheres, as in the case of elaborate bucchero kylix dedicated by *Laris Velchaina* in the sanctuary of Satricum, and probably originating from Caere.²⁶⁷⁹ It was from Caere that proto-Corinthian ceramics arrived (perhaps via the sea), as well as their imitations present at Satricum and other sites on the coast of Latium. Perhaps through Praeneste, Caere received Picene goods similar to types well known in that Latin city, located at the mouth of one of the routes that ensured communication with the Adriatic coast byway of neighboring Italic populations.²⁶⁸⁰

The need to access routes to the Adriatic is one of the main reasons that relations developed between the Etruscans, Umbrians and Sabines. The accelerated social and cultural dynamics set in motion by these contacts were crucial to the ethnogenesis of the Umbrian nation, according to Mario Torelli.²⁶⁸¹

The phenomenon took place particularly early in the Terni basin, where, already in the eighth century, there was a large proto-urban conglomeration whose necropolis shows close relations with Southern Etruria and the Faliscan area.²⁶⁸² During the Orientalizing period, in all nodal points of the trans-Appennine routes—largely coinciding with the future courses of the Salaria and Flaminia—there are rich burials that show contacts with southern Etruria, the Faliscan-Capenate area and Latium Vetus on one side, and with the Adriatic on the other. The way is marked by the diffusion of southern Etruscan bronze shields (in Poggio Sommavilla, Terni, S. Anatolia di Narco, Colfiorito, Matelica, Pitino di San Severino, Fabriano and Verucchio), which corresponds to the presence and imitation of the characteristic biconicals with differentiated handles of the “Terni-type” in the Volsini area and the hinterland of Vulci.²⁶⁸³ At the southern tip of this system, Otricoli, the port on the Tiber of the Naharci (Umbrians), is both the probable provenance of the first Paleoumbrian inscription, as well as the radiation point towards the Adriatic of certain vase types (for example, biconicals and four-handled chalices) and decorative techniques.²⁶⁸⁴ At the mouth of the Umbrian Valley, the recent archaeological findings from Spoleto confirm the same culturally varied framework, but with clear Adriatic connotations in the tomb-type, enriched by northern Etruscan elements.²⁶⁸⁵ Further north, at Fabbrecce—near Città di Castello—a warrior’s tomb²⁶⁸⁶ similarly shows mixed characteristics—Picene in tomb- and weapon-types (especially the helmet with composite calotte); Faliscan-Capenate in impasto ceramics, and Vetulonian in the bronze vessels (Fig. 50.2), which feature two bronze handles with lions and lotus flowers from a well-known series of lebetes also present in Picenum (Ripatransone).²⁶⁸⁷

Fig. 50.2: Handle of pyxis/censer from Fabbrecce (after Lo Schiavo, Romualdi 2009)

The later Trestina complex²⁶⁸⁸ confirms that this area, at the confluence of the Nestore River and the Tiber, functioned as a crossroads. It contains some of the most exported Etruscan materials in the Adriatic area in the Late Orientalizing period. These include the “Rhodian” oinochoai (Campovalano, Montedinove, Annifo di Foligno and Fabriano)²⁶⁸⁹ and the amphorae with griffin-protome handles, which were also found in Belmonte Piceno and Pitino di San Severino (Fig. 50.3), and attributed to the late Orientalizing

workshops of Chiusi,²⁶⁹⁰ a center that played a major role in relations with the Adriatic coast in this period.

Fig. 50.3: Chiusi bronze-amphora from Pitino di San Severino, Monte Penna, Tomb 14 (after *Piceni, Popolo d'Europa*, Rome 1999)

2.2The Adriatic coast

Contact with the opposite coast constituted the main cause of prosperity, since the richest Picene burials of the Orientalizing period (Pitino, Fabriano and Matelica) are located at strategic points that controlled east-west routes.

Since the second half of the eighth century, elements of Eastern traditions penetrated the Tyrrhenian area from the Adriatic coast through these routes,²⁶⁹¹ while Picene centers received from Etruria weapons and bronze vessels, objects that were designed to act as status symbols in the tombs of the emerging aristocracy. At Matelica, for example, the shield from Tomb 77

Brecce is perhaps Veientan, and the bronze biconical vase from Passo Gabella is probably Vulcian.²⁶⁹² With regard to the eighth century, the recent findings from Matelica show a decisive influence from Veii. This influence was probably connected to relations between this southern Etruscan metropolis and the Villanovan enclaves of Fermo and Verucchio, the last of which likely provided the large quantity of amber (also in the form of the raw material) found in grave goods from Veii and Latium (see chapters 46 Micozzi and 76 von Eles).

Fig. 50.4: Silver comb fibula from Fabiano, S. Maria in Campo, Tomb 3 (after *Piceni, Popolo d'Europa*, Rome 1999)

Relations were further strengthened during the seventh century, which gave an undeniable Tyrrhenian imprint on the Picene Orientalizing period, despite the likely presence of direct contacts with Greece and the East.²⁶⁹³

The rising Picene classes assimilated a Tyrrhenian aristocratic lifestyle and assumed its cultural models, like banquets with related accoutrements and the constant deposition in tombs of status symbols like shields, scepters and weapons for parades, but especially the *currus*, which indicates an adherence to the heroic model of war as an individual struggle.

Fig. 50.5: Composite oinochoe from Pitino di San Severino, Monte Penna, Tomb 14
(after *Piceni, Popolo d'Europa*, Rome 1999)

Many of the luxury items found in the richest tombs came directly from Etruria. In Tomb 3 of Santa Maria in Campo at Fabriano,²⁶⁹⁴ a comb fibula (Fig. 50.4) and two silver kotylai are probably Caeretan imports, like the five bronze ribbed paterae. On the other hand, Vulci can be associated with the askos, the bronze biconical vase and, likely, with the decorated ostrich egg, which was originally mounted as a refined oinochoae. Similar oinochoai in mixed media were among the most appreciated valuables in Picenum, as shown by the two other examples from Pitino (Fig. 50.5) and Matelica.²⁶⁹⁵

Bronze tripods of Etruscan manufacture appear in prestigious grave goods from Matelica, Tolentino, Pitino and Cupra,²⁶⁹⁶ often in association with several varieties of situlae—including those of Kurd-type (Fabriano, Pitino, Matelica and Filottrano), perhaps a Vetulonian imitation of the Hallstattian prototypes,²⁶⁹⁷ and basins with embossed rim²⁶⁹⁸ that were probably made in Southern Etruria. Southern Etruria can be linked to the above-mentioned bronze shields from Fabriano, Pitino and Tolentino, which were considered status symbols and were therefore present in female burial contexts, as also seen in the Tyrrhenian area.²⁶⁹⁹ Among other weapons, helmets with a composite calotte, which can be compared to an example from the Tomb A of Casale Marittimo, and those with lateral knobs (Buckelhelme) show a marked relationship with northern Etruria. The latter are attributable to Vetulonia and northern Etruria in the early Orientalizing period and hereinafter are widely attested through variants along the Adriatic coast.²⁷⁰⁰ Sharing weapon-types is a qualifying characteristic of the relations between Northern Etruria and Picenum in the Orientalizing period, and likely implies some mobility on the part of warriors—and of workers active in this field—on both coasts. The warrior of the Vetulonian Circle of the Sphinxes, who wears the kardiorphylax, a characteristic feature of the Picene armour,²⁷⁰¹ may be an example of this trans-Appennine mobility, while the aforementioned Fabbrecce Tomb acts as an intermediary case.²⁷⁰²

Especially in the first phase of the Orientalizing period, Verucchio, an Etruscan frontier settlement in continuous contact with the Tyrrhenian,²⁷⁰³ played an important role in the transmission of cultural stimuli and Etruscan products in the Adriatic and trans-Adriatic area (see [chapter 76](#) von Eles). For example, the two Vetulonian tripods from Lippi Tomb 8, of a type also found in Bologna, Este and Novo Mesto ([Fig. 50.6](#)), suggest an alternative route for the arrival of this type of artifact in Slovenia (see [chapter 82](#) Tomedi). A variant of this type found at Oria in Apulia²⁷⁰⁴ may confirm the insertion of the tripods in a circum-Adriatic trade, of which Verucchio was one of the main pillars.

In the ripe Orientalizing period, the vitality of the routes connecting the southern Tiber Valley and Southern Etruria to Picenum is well attested by ceramic ware that acquired forms, techniques and decorative motifs of Faliscan-Capenate origin.²⁷⁰⁵ Picenum welcomed bronze workers from Southern Etruria who were skilled in toreutics (as seen in the small bronze ciste with zoomorphic decoration from Matelica)²⁷⁰⁶ and ivory work, an activity in which iconographic inspiration and stylistic inflections of different origins can be found.²⁷⁰⁷

2.3The Northern Italy and Continental Europe

For most of the seventh century, before maritime trade reached the southern French coast in the Late Orientalizing period, Etruscan relations with continental Europe cannot be considered separately from Etruscan relations with the Venetic and Gola-secca cultures (see [chapter 81](#) Guggisberg), who controlled access roads to Alpine passes. Etruscan goods found north of the Alps also correspond with those present in these areas, which they likely reached by way of Etruscans of the Po Valley. Since Villanovan times, Bologna was an important manufacturing center that maintained close relations with northern cultures—reflected in its extensive and original craft production—and was also the hub of a dense trade network involving

products and cultural flux from the Italian peninsula northward and vice versa (see [chapter 75](#) Malnati).

In the seventh century, the Hallstatt area established a stable social hierarchy; grave goods in that period are particularly rich, ideologically modeled after those of the central Italian elite (especially with regard to the banquet's centrality and the frequent presence of chariots), but rarely include imported objects. When grave goods have been found that were imported, they consist mostly of Vetulonian bronzes, concentrated in eastern France and western Germany—to Appenwihr in Alsace (pyxis/ censer and ribbed bowl), Frankfurt-Stadtwald, Poiseul-la-Ville and Lyon (ribbed bowls)²⁷⁰⁸ (see [chapter 83](#) Baitinger).

These prestigious objects moved within a narrow circuit of relations between members of emerging elites. This is indicated by bronze vessels (especially situlae)²⁷⁰⁹ and horse harnesses from Central Europe which were found in aristocratic tombs in Este, Bologna, Vetulonia, Tarquinia, Bisenzio and Verucchio,²⁷¹⁰ and by the large amounts of Baltic amber in Etruria. During the Early and Middle Orientalizing periods, thanks to the reinforced connections with Bologna, Vetulonia assumed a major role in relations with the Hallstatt area, from which it received products and, most likely, artisans who were active in the thriving local bronze production (see [chapter 46](#) Micozzi), which impartially furnished burials for Celtic princes and Greek sanctuaries.²⁷¹¹ In Hallstattian Europe, burial customs, techniques and ornamental repertoire— particularly in metal working²⁷¹²—all document more intensive and continuous relations than appear from the scarcity of original Etruscan goods. The situation suggests that people also moved northward, probably as a result of commercial interests that are not archaeologically detectable.²⁷¹³

This phenomenon is particularly evident in the Eastern Hallstatt world, but it amplifies a situation also found on the other side of the Alps.

Already in the eighth century, the territory of Venetic culture shows great openness to the neighboring Villanovan area around Bologna, through which Tyrrhenian cultural models and products were also transmitted.²⁷¹⁴ In the Orientalizing period, the adoption of an aristocratic Etruscan lifestyle went hand in hand with the formation of a local aristocratic class that maintained relations with Etruria. Vetulonia furnished ornaments and precious bronzes intended for symposia, such as the tripod of Pelà Tomb 49 and a ribbed bowl of unknown provenance.²⁷¹⁵ Rather than through the exchange of goods, however, these aristocratic relations are proven by the reproduction of funerary customs, like the sumptuous ornaments in female graves, and references to the aristocratic ideals of the symposium, and those of hunting and war in male graves. Examples of small figured votive bronzes from Luzzo and Verona indicate that this confluence of styles was also caused by people moving from northern Etruria.²⁷¹⁶ Artisans from that area certainly contributed to the formation of the composite stylistic, figurative language of

Fig. 50.7: Bronze bowl from the Tomba del Carrettino, Como (after Camporeale 2001)

Even in the centers of Golasecca culture, in Lombardy and southern Piedmont, the hierarchical structuring of society accelerated hand in hand with the wealth resulting from the control of ancient trade routes going to the San Bernardino and Gotthard crossings. This hierarchical organization manifested itself by the late eighth century and over the course of the seventh with the emergence—first in Como’s necropolis—of tombs of rank with goods imported from Central Italy, among which were the stamped bronzes of Vetulonia, which evidently arrived via the Po Valley (Fig. 50.7).²⁷¹⁸ In the seventh century, Tyrrhenian influences—including the acquisition of writing—seem to have had preferential ties with centers of the western district, like Golasecca, Sesto Calende and Castelletto Ticino. This phenomenon probably coincided with the waning of Bologna’s intermediary role and the exploitation of an alternative route from the Ligurian coast to the Apennine passes and beyond and as far as the Tanaro River.²⁷¹⁹

During the seventh century, a number of ports on the Ligurian coast testify

to the new importance of maritime relations for the local people.²⁷²⁰ The oldest such port was certainly Chiavari, where the necropolis attests a particular facies of the Golasecca culture, permeated by elements from northern Etruria. Local grave goods precociously received also southern Etruscan imports,²⁷²¹ perhaps through the same sea route that led Greek and colonial ware to the Versilia (Tuscany) at San Rocchino and Baccatoio di Pietrasanta.²⁷²²

Beginning in the late seventh century, Genoa's role became predominant, both with regard to the amplitude of maritime contacts and to the control of important routes to the hinterland.²⁷²³

Along the northern border of Etruria, as in the southern and eastern borders, cultural osmosis linked Versilia and Eastern Liguria, which created a sort of integrated territorial compartment where Pisa's hegemony gradually grew.²⁷²⁴

2.4 Southern Italy and Sicily

Relations with the southernmost regions of the peninsula and Sicily were evidently influenced by two main factors that affected these areas in antiquity: Greek colonization and the presence of large Etruscanized areas in Campania (see chapters 73 Cin-quantaquattro and Pellegrino, 74 Bellelli).

Relations with the oldest colonial settlements in Campania—and the decisive role they had in the manifestation of the Orientalizing phenomenon—extend beyond the limits of this chapter. It is clear, however, that these relations were not unilateral, as demonstrated by Etruscan materials found in Pithecusan tombs, and in even greater quantities in high-ranking tombs of Cumae. These grave goods attest to an inter-ethnic solidarity between the ruling classes, expressed by shared tastes, values and status symbols, that were the primary cause of the contemporaneous diffusion of the Orientalizing phase in the Italian peninsula.

Fig. 50.8: Heron plates from Eloro (after *Sicilia archeologica*)

Seventh century Etruscan artifacts have also emerged in those indigenous centers of Campania, Basilicata and Puglia which already fostered close ties

with the main Greek poleis (see [chapter 80](#) Tagliamonte). These include bronzes destined for symposiums (ribbed bowls, basins, oinochoai),²⁷²⁵ most likely distributed by—if not produced in²⁷²⁶—Etruscan towns in Campania. These were luxury gifts for local aristocracies that do not pinpoint organized trade routes, but follow the ways of “gift-exchange,” a practice whose economic implications are certain.

Etruscan interest in Sicily, on the other hand, was mainly due to its position along trade routes with the Eastern Mediterranean and North Africa. The rare Etruscan artifacts present on the island between the late eighth and seventh centuries—mostly pottery fragments (sub-geometric, impasto and bucchero ware) and a few bronze bowls with beaded rims—are commonly considered goods brought by the Greeks and Phoenicians returning from Etruria (see [chapter 85](#) Albanese Procelli).²⁷²⁷ Therefore, artifacts of unmistakable Caeretan origin, like the plates with herons (in Syracuse, Eloro and Gela) (Fig. 50.8), are of particularly importance. They were rarely exported outside of the areas surrounding Veii and Caere, except to coastal sites (Pontecagnano and Sicily) that mark Caere’s early interest in long distance routes, which partially corresponds with the one taken by Aristonothos from Greece to Caere in the mid seventh century. This interest is confirmed by the strong Caeretan connotation of the most ancient Etruscan artifacts found in North Africa (see [chapter 88](#) Naso).²⁷²⁸

IV. Civilization

Archaic and Classical periods

Nigel Spivey and Maurizio Harari

51Archaic and Late Archaic Art, 580–450 BCE

Abstract: Thanks to the influx of craftsmen from Ionia, the art of Etruria in the Archaic period was shaped by a strong East Greek influence. The impact of both style and subject can be seen in black-figure vases produced in Caere and Vulci, in the painted tombs of Tarquinia, and in funerary sculpture at Chiusi and Vulci. By contrast, the use of terracotta in the design and decoration of temples in archaic Etruria was a distinctive local development (NS).

The first fifty years of the fifth century began what has been described as an “age of crisis,” which affected not just Etruscan civilization but all the pre-Roman groups of Italy. This period is referred to as a crisis because of political and social instability (the West was also marked by the great conflict between the Greeks and the barbarians, and Rome itself dramatically experienced strong class tensions) and, regarding the archaeological record, because of the scarcity of burials. The lack of burial evidence makes it problematic for us to define clear chronological phases, and this scarcity is at least partly attributable to rules against luxury, such as those included in the Roman laws of the Twelve Tables.

The naval battle of Cumae (474), when for the first time an Etruscan fleet (supposedly from Caere) was unequivocally and irrevocably defeated by the Greeks (from Syracuse), seemed to the ancient historical tradition (Diod. Sic. 11.51)—as well as to many modern commentators—to mark the end of an Etruscan thalassocracy on the northern Tyrrhenian Sea. Over time, one of the consequences of these events—a consequence that cannot be detected in the archaeological record prior to the final decades of the century—was a clear decrease in the distribution of Attic pottery to the coastal towns of southern Etruria and, more generally, their marked economic decline in this period, whereas the northern and inland areas flourished as far as the Adriatic ports of the Po Valley.

Therefore, when we speak of a crisis in the fifth century, we must clearly distinguish the second half of the century from the first. We should also always be aware of the contexts of particular examples: although Caere or Vulci seem, to some extent, to have been declining, other places, with different modalities, in areas such as the Tiber Valley (from Chiusi to Orvieto) and the Po Valley (Spina and other cities) were growing (MH).

1Archaic Art, 580–500

Nigel Spivey

1.1Introduction

For modern viewers, the art of Etruria in the Archaic period often serves to epitomize Etruscan cultural identity as a whole. Some of the best-known wall paintings at Tarquinia—the Tomb of the Augurs (Tomba degli Auguri), the Tomb of Hunting and Fishing (Tomba della Caccia e Pesca), the Tomb of the Bulls (Tomba dei Tori)—belong to this period; so too such “iconic” terracotta sculptures as the “Sarcophagus of the Married Couple”, from Cerveteri, and the “Apollo of Veii”. Indeed, it was a cardinal moment in the modern reception of the Etruscans when in May 1916, the latter figure was recovered, almost intact, from the site of the Portonaccio sanctuary at Veii. It was a statue whose fluid confidence of posture and presence was coincidentally attuned to a burgeoning twentieth-century preference for the relatively simple lines and forms of “primitive,” pre-Classical art (Fig. 51.1).

Fig. 51.1: Apollo of Veii, c. 510 BCE. Rome, Villa Giulia Museum (Photo SAR-Laz)

And yet archaic Etruscan art is a hybrid creation. Its patrons, we have no doubt, were the ruling families of more or less urbanized settlements throughout Etruria, but particularly along the Tyrrhenian coastline. The artists, however, are not so readily identified, either by their social status or by their ethnic type. If features of style and technique equate to signatures, then it would appear that much of the imagery we have recovered from archaic Etruria was produced by Greeks—and more specifically, by Greeks from the region once known as Ionia. Before we describe any of these images, it is necessary to sketch the background of geopolitical change across the Mediterranean during the sixth century BCE.

People speaking the Ionic dialect of Greek had established themselves on the shores of Asia Minor during the flux of migrations in the late Bronze and early Iron Age. Linguistically, these people related to Greeks in Attica, Euboea, and the Cyclades; culturally, their center was the island of Delos, sacred to Apollo. During the eighth and seventh centuries, this area gave rise not only to the epic tradition of Greek literature (including the works of Homer), but also Greek literacy, and the Greek philosophical venture of rational enquiry. But Ionia was dangerously close to the expanding Persian empire. The reign of Cyrus the Great (559–529) extended Persian power as far as the Hellespont; almost a century of outright Greek-Persian hostilities ensued, as we know from the narratives of the Ionian Herodotus.

Fig. 51.2: Detail of a late sixth-century BCE marble sarcophagus found at Gümüşçay, in western Turkey. Çannakale Museum (Photo N. Spivey)

Persian conquest was not the end of Greek presence in Asia Minor—as long as regular tributes were collected, Persian royalty was content to delegate authority— but Herodotus plausibly reports waves of emigration westwards, for example, from Phocaea, when besieged by the Persians in 540. To visit Phocaea today (Turkish Foça, to the north of Izmir) is to find a somewhat desolate former fishing village, with scarcely any ancient ruins. Its ancient inhabitants, however, were dynamic seafarers—the original colonists of Marseilles (Massalia), and pioneers of Greek trade with Corsica and the Iberian Peninsula—even before the Persians arrived. Herodotus (1.165–6) mentions an unhappy episode of rough justice between Phocaeans and Etruscans on the shore of Agylla, the port of Cerveteri (Caere). But this

cannot typify the historical process of the Archaic period. Greeks from Ionia appear to have been welcomed in Etruria; or, to put it another way, they seem at least to have left their mark as *émigré* artisans.²⁷²⁹

Fig. 51.3: Detail of the so-called “Boccanera slabs”—painted terracotta plaques from the Banditaccia cemetery, Cerveteri. Mid sixth century BCE. London, British Museum (Photo N. Spivey)

The East Greek style is typified by a detail of a sarcophagus found in the Troad region in 1994 ((Fig. 51.2). A woman makes a gesture evident of grief and shock, raising her arms to her head. The mix of frontal and sideways view is characteristic of archaic art; more specific to the region, however, are the features of the face, with its “flying profile” of forehead and nose, lips curved as if in a smile, and slanting, fronton eyes. Compare this figure with a trio of females depicted upon a set of terracotta slabs from Cerveteri (Fig. 51.3). They may belong, as it were, to the same world. A scene of the sacrifice of Polyxena, and perhaps the Judgment of Paris—the subjects of the sarcophagus relief and the painted plaques respectively appear to include narratives that relate to Greek mythology, in particular to the epic cycle connected with the Trojan War. Their kinship of style, however, suggests more than just a shared stock of stories. A diaspora of artistic talent is implied.²⁷³⁰

1.2 Painting and sculpture

Among the East Greek artists who seem to have settled in south Etruria during the Archaic period are the painters (arguably a pair) who produced the so-called “Caere-tan hydriai,” a series of lively black-figure vessels that

represent a variety of generic and mythological scenes.²⁷³¹ Such vases supplied the needs of Etruscan aristocrats conducting the formalities of communal drinking, and may have complemented the rhapsodic entertainment offered at such occasions. Were poems about the wrath of Achilles or the labors of Herakles sung in Etruscan? While we lack substantial evidence for that process of literary translation and adoption, the iconographic record points to a process of creative fusion by both indigenous and immigrant artists. It is most telling in the development of subterranean wall-painting, as preserved by the funerary customs at certain Etruscan centers—particularly Tarquinia, where a small but significant proportion (estimated at 2–3 percent) of the city’s rock-carved tombs were layered on the interior with a light plaster and then painted.

Structurally, these tombs appear imitative of domestic architecture, with doorways, couches, and mock tectonic features such as beams and sloped roofs. It is not clear, however, how far their decoration mirrors the interior of houses, “palatial” as they might have been. Elements of the imagery—for example, checkered patterns across a ceiling—suggest the influence or model of textile hangings. It may be that certain paintings evoke tents and parasols, perhaps temporarily erected for funerary or other ceremonies. There are also references to landscape and views of outdoor activity, for example, in the Tomb of Hunting and Fishing which depicts a charmingly out-of-scale idyll showing several youths fishing at sea, while another shoots at birds with a sling. The cultural *milieu* of the period extends beyond Etruria, and beyond Italy. Prominent on the far wall of the Tomb of the Bulls is a scene that can only be explained by “insider knowledge” of epic poetry from east Greece. It represents a subplot of the war at Troy, as the young Trojan prince Troilus steers his horse towards a fountain, where Achilles is lurking with murderous intent. An erotic twist to that story—according to one version, Troilus and Achilles were lovers—may help to explain the images of copulation painted in the register above.²⁷³²

It is natural enough to search the imagery of these tombs for clues to Etruscan beliefs about the afterlife. By scholarly tradition, the paintings that belong to the Archaic period are broadly characterized by their celebratory—even cheerful—aspect. The demons and stricken victims represented in later tomb-paintings (see [chapter 63](#) Gilotta) are absent; instead, scenes of feasting, dancing, athletics and other games prevail. Whether such pictures reflect the “lifestyle” of the deceased, the occasion of a funeral, or the imagined bliss of some posthumous existence, they appear equally charged with vital energy, a gift to those moderns (e.g., notoriously, D.H. Lawrence) who would romanticize the Etruscans. Conventions of style play their part in giving this impression—parallels, then, for an exaggerated arm and leg postures of revelers shown on the “Fikellura” painted pottery from Ionia—but we should absorb significant aspects of scene-setting here. Specific allusions are made to the formalities of ceremonial drinking, such as the capacious bowl for the

mixing of wine and water, garlanded with foliage appropriate to the god Dionysos, and the proper jug (*oinochoe*) for pouring the diluted wine; also to the lyre—the *kithara*, equally suitable for accompaniment to poetic recitation as to dancing—and the double-pipe (Colour plates 27–29). It is likely, in view of such formalities, that artists from the eastern Mediterranean offered fresh modes of imaginative expression to local funerary customs. If, as we presume, the tomb paintings relate essentially to the institution of worshipping family ancestors, then it would be plausible to invoke not only Dionysiac or Orphic beliefs about rebirth and renewal, but also the cult of heroes. So the pseudo-regal splendor of a reclining male figure conspicuous in the same tomb (Colour plate 30) probably signifies the deceased as an aggrandized person due familial veneration; it is tempting to suppose that the way in which he is shown holding an egg has, in this context, some mystic importance.

Even with the benefit of literary sources from Greece and Rome—some of them alluding directly to the Etruscans—it remains difficult to expand on such vague interpretative phrases as “*some mystic importance*.” Evidence from the post-Archaic period indicates that the cult of Dionysos (“Bacchus” to the Romans; “Fufluns” in Etruscan), diffused from the eastern Mediterranean, was widely established in Italy. But its attendant beliefs about the afterlife, and those entailed by the related cult of Orpheus, are necessarily obscure, for these were “mystery religions” whose initiates kept to measures of secrecy. So we are left to make rather bland observations about the imagery of these archaic paintings, and rely upon comparative references for comprehension. In the Tomb of the Augurs, we interpret as an augur or *haruspex* one bearded figure carrying a curved staff, possibly gesturing towards birds in flight; close by are two hefty wrestlers, presumably contending for metal cauldrons as prizes at funerary games. Then comes a masked figure that appears to be goading a leashed mastiff to attack a man armed with a club, yet hampered by a sack over his head (Colour plates 17–19). Since ancient authors suggest that gladiatorial combat had its origin in Etruscan funeral ceremonies, we speculate that some form of scapegoat punishment is being depicted here.²⁷³³

Funerary sculpture of the Archaic period shares features of style and subject with the tomb paintings. Around the middle of the sixth century, the production of relief-carved sarcophagi began at Chiusi, and images on these limestone containers repeatedly evoke the practice or pretensions of aristocratic/heroic feasting, chariot racing, and so on.²⁷³⁴ Further south, sculptural elaboration of sarcophagus lids took new forms. Only intuition tells us that the couple represented on the lid of a famous Caeretan sarcophagus are conjugal, but their rendition is certainly harmonious, and the sculptor has succeeded in modeling the pair so that their bodies merge convincingly as if on a banqueting couch, even though the position of the bodies, and their relative scale, defies the laws of nature (Fig. 51.4). Similar (and less accomplished) pieces indicate that both figures originally held separately fashioned objects—the male perhaps an egg, his partner perhaps a small flask

and a pomegranate.

Fig. 51.4: Detail of the “Sarcophagus of the Married Couple” from Cerveteri, late sixth century BCE. Rome, Villa Giulia Museum (Photo SAR-Laz)

Finished with paint, the medium of terracotta for life-sized or near-life-sized statuary was one that became something of a regional specialty during the sixth century. Soft volcanic stone was also exploited, as testified by a series of figures from the cemeteries at Vulci and elsewhere inland.²⁷³⁵ These appear to have been placed as markers to tombs, and their range includes types appropriate as sentinels: sphinxes, rams, and big cats. More unusual, the image of a boy astride a hippocamp (Fig. 51.5) may demand a more committed symbolic interpretation. Does it represent the journey from this world to the next?

Fig. 51.5: *Nenfro* figure of boy astride a hippocamp, from Vulci, c. 520 BCE. Rome, Villa Giulia Museum (Photo SAR-Laz)

Tombs were, of course, furnished with items once held precious in life, and conceivably deemed useful in death. Many of these items may have been made of metal—jewelry, weapons, vessels and utensils—of which most have not survived depredation; a considerable quantity was made up of imported *objets d'art*. The fact that thousands upon thousands of painted vases survive from ancient Greece, mainly Athens, is directly accounted for by the collecting habits of Etruscans. Often decorated (and inscribed) to encourage the recall of Homer and other sources of Greek mythology and cosmology, these vases demanded some erudition from their owners. Some comparable scenes of myth were attempted by local practitioners of the potter's art, but generally Etruscan vase-painters were content to produce images loosely associated with Dionysiac cult. The beginning of the Archaic period saw an end to the influence of Corinthian style on Etruscan pottery, and the development of certain local, even individualized styles. One sixth-century artist identified by the process of attribution is the so-called Micali Painter, probably based at Vulci. Seemingly illiterate, his output is stocked with a variety of fantastic creatures—sirens, sphinxes, centaurs, satyrs and so on—

but he also produced scenes that may be derived from local festivals. A vigorous vignette of two pairs of dancers shaking to the sound of their castanets (Fig. 51.6) suggests direct observation, though we may note the abbreviated foreheads and mixed frontal/sideways view characteristic of Ionic influence.²⁷³⁶

1.3Architecture

It is on the large scale, however, that art most conspicuously flourished in sixth-century Etruria, for, as in Greece, this was a period of monumental development in cities and their sanctuaries. Oligarchic or tyrannical constitutions required grandiose residences and meeting-places for the ruling elite, while sanctuaries competed one with another to attract pilgrims and dedications. And where rulers assumed their right to rule as divinely given, the distinction between grandiose residence, meeting place and temple might consequently have become hard to draw. Such is the categorical problem left by the site of Murlo (Poggio Civitate), in the Tuscan hills. Archaeologically, Murlo is unusual insofar as it was abandoned already by the end of the sixth century, and left undisturbed until modern times. This ought to favor the archaeologists, but defining the purpose of structures brought to light at Murlo is a challenge. The principal building was an ample, partly colonnaded courtyard enclosure, whose rooftops were decorated with a variety of akroterial terracotta statues, including some enthroned figures with

extravagant wide-brimmed headgear, and a large sphinx. Along the interior wall of this enclosure ran a series of terracotta friezes, with relief representations of activities that seem descriptive of elite status, including banquets, music, hunting and equestrian displays, processions and prize items. But the friezes may also show some sort of assembly of deities. Generically such friezes are known to have been suitable for display on temples, not only at other Etruscan, but also various central Italian sites. So while the layout of the court building at Murlo may be supposed a “palace,” its decoration indicates a religious function as well.²⁷³⁷

Fig. 51.7: Reconstruction of the Portonaccio temple at Veii (c. 510 BCE). (After NS1953)

The design of temples in archaic Etruria became sufficiently distinctive, such that it was eventually recognized by a Roman architectural historian (Vitruvius) as a “Tuscan order.” Simple and non-canonical by comparison to the Greek Doric order, with unfluted columns rather obviously (for Vitruvius) derived from tree trunks, it gave temples a quadrangular aspect, the approach marked by steps up to a porticoed porch, beyond which were three doors leading to a triple-chambered cella. The Romans understood that artists from “all over Etruria” came together to create the archetypal temple on Rome’s Capitoline hill, dedicated to the “Capitoline triad,” Jupiter, Juno and Minerva, as enshrined during the century or so that the Etruscan dynasty of the Tarquins ruled at Rome (around 616–509). Central to “the great Rome of the Tarquins,” *la grande Roma dei Tarquinii*, this temple hosted three leading deities of the Greek pantheon—Zeus, Hera, and Athena—by way of their Etruscan equivalents, Tinia, Uni, Menerva. It overlooked a forum-area first paved during the same period of Etruscan rule, and the Tarquins appear to have sponsored other areas of monumental development, notably, the sanctuary of Sant’Omobono by the banks of the Tiber.

But the prime example of Etruscan sacred architecture in the Archaic period is the Portonaccio temple at Veii. Reconstructed as it probably appeared in around 510 (Fig. 51.7), the edifice could never have been mistaken for a Greek temple, and yet its decoration cannot be understood without the framework of Greek theology and mythology. The roof was set at

a low sloping angle, making it almost impossible to place any sculptural decoration in the pediments. As if by way of compensation, large saddle tiles were placed over the central ridge-pole, to carry “life-sized” terracotta figures of supernatural beings: Apollo, Hermes, Herakles and (probably) Apollo’s mother Leto, nursing her infant son.²⁷³⁸ Dedications associated with the altar of the temple suggest that the presiding deity was Menevra-Athena, in her warlike aspect; we cannot be sure how the figures on the rooftop—best appreciated by viewers approaching laterally—composed a narrative relative to the cult practice here. But the statues played out a tableau whose backdrop was the heavens—an installation eminently suited to the subject, and perfectly placed to display the virtues of Etrusco-Ionic style: fluency, grace, and simplicity of line.

2Late Archaic art, 500–450

Maurizio Harari

2.1Introduction: the so-called crisis of the fifth century

The first fifty years of the fifth century began what has been described as an “age of crisis,” which affected not just Etruscan civilization but all the pre-Roman groups of Italy.²⁷³⁹ This period is referred to as a crisis because of political and social instability (the West was also marked by the great conflict between the Greeks and the barbarians, and Rome itself dramatically experienced strong class tensions) and, regarding the archaeological record, because of the scarcity of burials. The lack of burial evidence makes it problematic for us to define clear chronological phases, and this scarcity is at least partly attributable to rules against luxury, such as those included in the Roman laws of the Twelve Tables.²⁷⁴⁰

The naval battle of Cumae (474), when for the first time an Etruscan fleet (supposedly from Caere) was unequivocally and irrevocably defeated by the Greeks (from Syracuse), seemed to the ancient historical tradition (Diod. Sic. 11.51)—as well as to many modern commentators—to mark the end of an Etruscan thalassocracy on the northern Tyrrhenian Sea. Over time, one of the consequences of these events—a consequence that cannot be detected in the archaeological record prior to the final decades of the century—was a clear decrease in the distribution of Attic pottery to the coastal towns of southern Etruria and, more generally, their marked economic decline in this period, whereas the northern and inland areas flourished as far as the Adriatic ports of the Po Valley.²⁷⁴¹

Therefore, when we speak of a crisis in the fifth century, we must clearly distinguish the second half of the century from the first. We should also always be aware of the contexts of particular examples: although Caere or Vulci seem, to some extent, to have been declining, other places, with different modalities, in areas such as the Tiber Valley (from Chiusi to Orvieto) and the Po Valley (Spina and other cities) were growing.

Concerning the years 500–450, any attempt to reconstruct a historical and artistic summary has to engage with a reality which, in the terminology of Greek styles, oscillates between the “Archaic” and “Classical” but cannot comfortably be associated with the term “Severe,” which should indicate just this moment of transition. Otto Brendel preferred to speak of a “Late Archaic” period (instead of Early Classical) to characterize the years 500–470, in order to emphasize what we may refer to as a development syncope in which the Etruscan artistic language incorporated some of the new ideas of Early Classical Greek art but never completely abandoned its Archaic traditions.²⁷⁴²

At the beginning of the fifth century, if we look at the central places of Greek innovation, the peripheral nature of Etrurian art can be described as becoming increasingly detached from the figural tradition of East Greece—including areas such as Phocaea, Miletus, and Samos—which until that time had been sufficient for expressing the luxury and elegance of the local aristocracy. From 500 onward, however, and in terms of sources of inspiration for the iconographic and stylistic choices, the *cité des images* was Athens,²⁷⁴³ a shift which is evidenced by the presence of Attic red-figure pottery on the Etruscan market, which was so appreciated and so systematically spread that it came to constitute a kind of monopoly.

It remains the case, however, that we cannot know with any certainty the precise nature of the goods traded and exported to Greece—in all probability metals and grains—or the nationality of the marine traders. It seems that these people were not necessarily always Athenians, as is suggested by the case of Sostratus, the ship owner from Aegina who is mentioned by Herodotus (4.152) and was the author of the famous votive dedicatory inscription of an anchor at Graviscae (Fig. 35.12).²⁷⁴⁴ It has been recognized that commercial activities originating in Aegina played a significant role in the framework of Etruscan Italy between the sixth and fifth centuries also on the Adriatic coast, in the two ports of the Po delta (Adria and Spina); and a possible influence of the prestigious Aeginetan school of sculpture has been cautiously suggested for some bronze figurines produced in the workshops of northern Etruria and the Po Valley.²⁷⁴⁵

Although it is obviously not possible for us to know the identity of the protagonists involved in these exchanges, it is important for art historians to recognize and consider the eminently pottery-based transmission of the models. As Brendel remarked, it is very difficult for us to understand how it would be possible for the great Attic or Argive bronzes to have reached Tyrrhenian Italy.²⁷⁴⁶ This means that the local artists—except in the rare

cases where they may have had some international training or may have travelled to Greece—would not always have been able to follow and so imitate the latest developments in Greek sculpture. Therefore, we have to assume that their knowledge of such pieces (which they would not have been able to analyse directly via observation of the original works) could have come almost exclusively through their translation in paintings or, simplified, through their representations on vases. As a result, the Attic red-figure pottery of the period immediately after Euphronios (with the products of the Sub-Archaic and Severe masters, which are well attested in funerary furnishings of southern Etruria) must be considered the basic reference points for a correct historical interpretation of Etruscan art in the first half of the fifth century.

A parallel from the study of the indigenous pottery production confirms this assumption. In the Vulci series—which starts with the Micali Painter and his pupils (in black figures), continues with the Group of Praxias (decorated in superposed color), and concludes with the beginning of new workshops in the Tiber Valley (both in superposed color and in red-figure)—it is possible to observe a unique continuum which is characterized by an ever-increasing dependence on and imitation of Attic models.²⁷⁴⁷

2.2 Painting

Within the context of the major arts, the effects of the dynamic role of Attic pottery production can be most clearly recognized in the wall paintings of the tombs of the Tarquinia elite which—despite the crisis—make a continuous, consistent series of monuments, as is unusual in Etruria. The primary effect of this Attic influence is iconographic, but it influences organization of the thematic choices and their relationship with the architectural (and symbolic) space of the burial chamber. The Greek *symposion*, where guests had to drink mixed—never unmixed—wine while reclining on *klinai*, had been seen for more than a century and a half as indicative of high manners, and as an appropriate lifestyle for the aristocracy, and so was used as the main subject of Etruscan painting. Such drinking scenes are represented on the side walls as well as on the back wall and in the main spaces as much as in the pseudo-tympanum.

We may consider the case of the tomba delle Bighe (Tomb of the Chariots), which dates to around 490 or shortly thereafter.²⁷⁴⁸ In this case the simplified and amplified image of a pair of symposiasts, placed either side of the krater, and the two *paides* who serve them, are accompanied within the back tympanum by the sequence of three *klinai* in the corresponding lower register and by a *kylikeion* (cupboard) which borders in the right wall. The Greek *symposion*, evoked here by constant and insistent references to schemata widely depicted on Attic pottery in the late sixth and early fifth century, is not, however, represented as a realistic description of an actual ceremonial event,

which may also be said of the dance scenes played out among slender trees and depicted on the side walls. The function of these images is symbolic. They are indirect replacements for those who are no longer visibly present (the deceased), and are visual markers of their social prestige. The same can be said about the lower frieze depicting *athla* (exercises of fighting and boxing, gymnasium scenes, a parade of chariots) attended by spectators arranged in two levels on little stands. Even though the scene is contaminated by the presence of jugglers and pantomime figures according to local tastes, these are, in fact, images of Greek athletic *paideia*. In the same sense, the ostentatious displays of pederastic affections located in the lowest rank of the stands originate from the educational models present in Athenian society and follow well-known models of Attic vase-painting dated to the beginning of the century.

A second aspect of this process of Attic influence, recognizable on a stylistic level, is clearly illustrated by the paintings at the Tomb of the Chariots, where all the characters, as has been very well said, “seem to come from the album of an Attic vase painter of the first two decades of the century, from the Painter of Kleophrades to Makron, from the Berlin Painter to Brygos.”²⁷⁴⁹ In particular, in the case of the small frieze of *athla*, the joyous display of cleverly varied and overlapping anatomical images, created by the Etruscan author of the fresco would have required a careful and updated study of Athenian vase painting.

The Tomba del Triclinio (Tomb of the Triclinium),²⁷⁵⁰ although slightly more recent, already shows a clearly perceptible trend toward a mannerist standardization of this iconographical system, which is quite elegantly executed, but without the same sense of enthusiasm or experimentation (Colour plate 39). On the sides, again, young men and women play and dance in a grove, and on the back wall is the banquet scene (depicting two married couples in profile on their *klinai*, with a third bed askew), which is dominated in the tympanum by a striking trophy of corymbes (clusters of berries typical of ivy) and ivy which seems to be growing between two half-reclining young men and exuberantly intruding into the space of the pseudo-ridgepole. On the entrance wall, an ivy branch is depicted between two panthers—a revival of a typical iconographic motif of the previous century—while at the sides of the door two young men dismount a horse.²⁷⁵¹

The long discussion on the significance of the Tarquinian paintings—as realistic rather than eschatological, or vice versa—has now given way to other, more convincing, functional readings of visual pathways within these highly symbolic areas, such as tombs²⁷⁵². It has become clear that, throughout the first half of the fifth century, and shortly thereafter, the burial chamber came to be conceived as an intermediate space between life and death. Such sites certainly represented the location of the physical remains of the dead, of his grave goods, and of ritual actions as well as the offerings of the survivors, but they were separated from the proper Hereafter, which remained

unreachable by the living persons, behind the rocky diaphragm of the back wall. As a consequence, the only truly eschatological images were confined to the back tympanum; the function of all the other images was to depict qualifying moments in the existence of the aristoi.

The Tomba della Nave (Tomb of the Ship) (Fig. 51.8)²⁷⁵³, dated to around the mid fifth century or shortly thereafter, is particularly problematic, since at this site, one of the characters of the symposium who is standing next to the *kylikeion* turns to look at a seascape—in which a large freighter, followed by lesser vessels, turns toward an impressive cliff—and raises his right arm as if he were signaling something to the sailors. This is a unique iconography and, as such, can be interpreted in several different ways.

We could certainly suggest a biographical explanation and imagine that the economic and social fortune of the gens who owns the tomb was tied to maritime trade. (This might be the case with the more ancient Tomba della Caccia e della Pesca, tomb of Hunting and Fishing, datable around 530²⁷⁵⁴, where the scenes of fishing and fowling may well have alluded to the so-called economy of the swamp²⁷⁵⁵ that provided income on large rural estates.) (Colour plates 21–26) It is more likely, however, that the unusual seascape is an indication of the beginning of a process whereby the pictorial system of the tombs at Tarquinia was being restructured so as to give space to displays of otherworldly journeys, something that increasingly imitated representations in Greek culture sources (including literature). In this case, the ship would bring the dead to a place of happiness, expressed by the symposium of the ancestors, beyond the rocks of the metaphorical wreck.²⁷⁵⁶

Fig. 51.8: Tarquinia, Tomb of the Ship, detail of the paintings: a seascape and three men standing close to a sideboard (drawing from Colonna 2003, 66, fig. 3).

Two successive examples of this process of iconographic transformation can be seen. The first is from the beginning of the second half of the century, in the desolate and rocky landscape depicted in front of Charon's ferry on the right wall of the Tomba dei Demoni Azzurri (Tomb of the Blue Demons) (Fig. 57.8).²⁷⁵⁷ The second, from around 400, is in the representation of the cavalcade of the dead (derived from the most famous depiction of a cavalcade, that of the Parthenon), who are heading to the very distant land of the Pygmies (the Pygmies are painted on the left wall and give their name to

the tomb),²⁷⁵⁸ who are incessantly and bloodily fighting with the cranes.

The enduring vitality of the Tarquinia School of painting during the fifth century is also illustrated by the extent to which it was appreciated beyond the local area. This broad appeal is proved by the imitation of the same iconographic and stylistic formulas in the paintings of the Chiusi Tomba della Scimmia (Tomb of the Monkey)²⁷⁵⁹ as well as at Colle Casuccini,²⁷⁶⁰ which can be traced, for example, to the Tombs of the Chariots and the Triclinium. One may well accept the idea that the builders of the Chiusi tombs were from Chiusi, but the position of Tarquinia as a model is obvious, and the transplantation of this purely southern Etruscan tradition of tombs of prestige to the Val di Chiana area is a sign of economic growth among the northern aristoi which led, in a few decades, to a marked geographical shift of new artistic ventures to the North.

2.3.Sculpture and architecture

We now consider sculptural production and discuss a series of monuments that differ in terms of materials and techniques.

We begin with marble works, because of their rarity. Produced at least thirty years after the problematic so-called Venus of Cannicella from Orvieto (Fig. 18.6),²⁷⁶¹ the head of a kouros in the Lorenzini collection of Volterra (490–480),²⁷⁶² which was carved in a type of local marble (It. *grechetto*) (Fig. 51.9), shows some persistent features of the Ionicizing koine (almond-shaped eyes, here extraordinarily dilated; Archaic stretching of the corners of the mouth) covering quite a solid structure in the Severe style.

This is what differentiates this Volterra kouros from the few earlier example from Marzabotto.²⁷⁶³ The Marzabotto piece, which seems to have belonged to a votive statue (or a *simulacrum*, a statue of a deity) related to the temple of Tina,²⁷⁶⁴ is stylistically more consistent but at the same time less expressive and is generally considered a Cycladic import.

It was much more common, however, for sculptures to be made from a soft material that was easier to work, as was normally the case in Etruria. The Chiusi workshops, for example, had produced funerary *cippi* and urns by *pietra fetida* which, in the late sixth century, were remarkably faithful to northern Ionian models.²⁷⁶⁵ The celebrated warrior's sarcophagus from the Sperandio necropolis near Perugia (Fig. 51.10)²⁷⁶⁶ represents a unique case of adjustment of this typically Clusian production to the inhumation rite. The relief, on its long side, displays a complex and novel processional sequence, variously interpreted as an image of the migration of a clan, a victorious return (with war booty and prisoners), or a solemn sacrificial procession. We should stress that its author consciously chose to *narrate* a theme—and we are very tempted to say that this theme was *historical*, recalling that this is one of the key aspects of the Etruscan heritage in Roman art—and he was able to do

this successfully by iconic and morphological means of East-Greek origin.

Fig. 51.9: Marble head of a kouros. Volterra, Lorenzini collection (photo SAT)

Among the sixth century precedents, we should mention also the so-called Pluto of Palermo (about 540) (Fig. 51.11), an impressive funerary statue conceived as a gigantic canopic urn, reshaped from the model of the heavy, imperious statuary type of the Branchidae, the priests of Miletus²⁷⁶⁷. This true masterpiece belonged to a context of works promoting individual grandeur and power, a concept soon to be expressed in political institutions through the charismatic and not entirely legendary figure of King Porsena.

However, production of these funerary statues did not cease with the fall of the monarchy, but was revived in the fifth century, and as such, they enjoyed a certain degree of continuity as a series.²⁷⁶⁸ Production limited almost exclusively to Chiusi and the surrounding areas, in line with a sense of religious conservatism that even included a survival of the protohistoric rite of cremation. This occurred around the middle of the fifth century and clearly

reveals the use of a formal language that can be identified with the so-called Severe style, which had enjoyed recent successes even in the colonies of the West, although the key iconographic influences continued to be, essentially, those of East Greek art.

Fig. 51.11: Male funerary statue from Chiusi, the so-called Pluto. Palermo, Archaeological Museum (photo M. Harari)

In the Chiusi area, the large bronzes, too—for obvious reasons very poorly documented—are a strong signal of this change, as can be seen with the

fragments of possibly two cult statues from the Moon Shrine at Acqua Santa in Chianciano (490–450; Fig. 51.12).²⁷⁶⁹

In terra-cotta sculpture—that *plastikē* which Pliny (*HN* 35.152) judged to represent Etruscan art above all else—there can be no doubt that the most important achievement is the famous pediment in high relief which adorned Temple A at Pyrgi, now at the Villa Giulia Museum in Rome. In order to trace the full historical significance of a monument that, just on the grounds of its exceptionally high quality, may appear, at first sight, isolated, it is necessary to take a step back and focus the terra-cotta production centers during the last decades of the sixth century.

From this point of view, one must remember Varro's statement, collected by Pliny (*HN* 35.157), which presented the school of Veii as predominant. In particular, Pliny mentions a commission given to the school of Veii for the sculptures of the Temple of Jupiter at the time of the Tarquins, and he provides us with the name of the workshop's founder: Vulca. The extraordinary acroterial and votive statues as well as ante-fixes (also molded by hand), discovered at the site of the shrine of Menerva in Portonaccio, have served as evidence of the excellence of sculptors who were educated in the figural grammar of the Ionic international style. Nevertheless, these artists were also sensitive to the latest Aeginetan discoveries and were able to adapt their wonderful mastery of expression to the needs of Etruscan (and Latial)

temple architecture with magnificent works in terra-cotta that were entirely consistent with the logic of religious communication.

The Veii school is traditionally considered to have created the clay sculpture from which was cast the celebrated bronze of the Capitoline Wolf (Fig. 51.13).²⁷⁷⁰ This sculpture was possibly conceived in the early fifth century as a Romulean icon in the new post-tyrannical Rome as a reference to the founder and eponymous hero of the city: such a program can easily be compared with the more or less contemporary revival of Theseus in post-tyrannical Athens. On the other hand, recent archaeometrical analyses of its casting technique have supported the idea that this might be a medieval work,²⁷⁷¹ a conclusion which would obviously (and unfortunately) remove this true masterpiece from the corpus of Etruscan art, if accepted.

Caere was also home to an important production of terra-cotta figures in the late sixth century. Examples of these works include the two beautiful sarcophagi—in fact, urns—of the Married Couple (now at the Villa Giulia and in the Louvre),²⁷⁷² the acroterium with the goddess Thesan running on a wave and carrying a young, kidnapped, lover in her arms (now in Berlin),²⁷⁷³ and the intriguing antefixes of the so-called *Edificio delle XX Celle* (or the House of the Sacred Prostitutes) in the northern *temenos* of Pyrgi.²⁷⁷⁴ These examples—especially the sarcophagi—reveal a clear dependence on the Veii school through migrant craftsmen, perhaps, or the location of their subsidiaries in the territory of the coastal city. The semi-recumbent youth depicted on the lid of an urn (Fig. 51.14: also found in Caere)²⁷⁷⁵ clearly indicates that the style was significantly updated at the beginning of the fifth century and in Latium, too, a similar process can be detected in the terracottas of the temple of Mater Matuta at Satricum,²⁷⁷⁶ which rightly appear as imitative of Aeginetan sculpture.

This vibrant context of southern Etruscan experiences can be identified as the location of the anonymous creator of the Pyrgi high relief (Fig. 51.15),²⁷⁷⁷ which is considered to be the highest achievement not only of the fifth century but of all Etruscan art, and which is truly representative of Brendel's notion of a classical art developed outside of Greece.²⁷⁷⁸ The Pyrgi high relief cannot be considered a properly pedimental sculpture according to the traditional definition in Greek sacred architecture. It is instead more comfortably defined as a kind of great *pinax* of worked clay in relief, which was to be screwed onto the head of the wooden ridgepole on the eastern side of Temple A, toward the entrance to the sanctuary and the road to the city of Caere.

Fig. 51.13: The Capitoline Wolf, Rome, Capitoline Museums (photo M. Harari)

Temple A, stratigraphically dated to around 460, was erected in the northern *temenos* of the sanctuary adjacent and parallel to the oldest structure, Temple B. Temple B was a Greek peripteral temple that was dedicated by the king (or tyrant) Thefarie Velianas to the Levantine goddess Ishtar (identified with the Etruscan goddess Uni) at the end of the sixth century. This is indicated by the bilingual (Etruscan and Punic) text inscribed on three gold plates, which were originally nailed to the doorpost (Fig. 35.2).²⁷⁷⁹ Temple A, however, belongs to the so-called “Tuscan” temple type, according to a classification that goes back to Vitruvius (4.7). It does have three *cellae* and one colonnade only on the front, to the west and facing the sea. Thanks to the above-mentioned epigraphic record, the identification of Temple B as dedicated to Ishtar is unquestionable, while extant Greek literary sources²⁷⁸⁰ do suggest that it is possible for us to identify the deity of Temple A with Leucothea, a translation of the Etruscan goddess Thesan, the divine personification of Dawn.

Fig. 51.14: Terra-cotta lid of urn, shaped as a semi-recumbent youth from Caere. Cerveteri, Archaeological Museum (photo SAR-Laz)

The relief of Temple A is cleverly constructed to favor a point of view from below, and seems to have been modeled on an important pictorial source, in terms of the excellent and intricate superposition of six figures. The subject includes two episodes from the Theban legend: the death of the blasphemer Capaneus by lightning, and the cannibalistic banquet of Tydeus, themes that are in some way connected also in the much later poetic account of Statius (*Theb.* 8.745–66). During the final battle under the walls of Thebes, it was Capaneus who literally threw down the body of Melanippus to be eaten by his enemy Tydeus, who was dying. The composition of Pyrgi is completed by the figure of Menerva (Athena) on the left, who, puzzled, abandons the battle and holds the useless jar containing the philter of immortality, whereas Tinia (Zeus) is joined in his assault on Capaneus by a second warrior of impressive stature. This latter might be the god of war, Laran (Ares), who takes an equal part in the punishment of the wicked, and together with Tinia and Menerva constitutes a divine triad, located in the semisquare on the left, while the figures on the right, with impeccable consistency, are three heroes, each of whom overcome in a different way.

The eclectic style adopted by the sculptor is very effective in the blending (not accidental, but intended to highlight the expression) of ingredients with differentiated provenance. Though the furious masks of heroes (and of Tinia himself, also bearded) evoke a Sub-Archaic manner of obviously Euphronian derivation, the soft treatment of the drapery sometimes appears much more evolved. Significantly, the head of Menerva, with the lower jaw horizontal and the almost complete disappearance of a smile, is clearly associated with

the new Severe sculptural language.

Fig. 51.15: Terra-cotta high relief from the Temple A at Pyrgi. Rome, Villa Giulia Museum (photo SAR-Laz)

The unique complexity of this work stands out even at the level of iconological interpretation. In comparison with the widely held—perhaps anachronistic—interpretation that the piece contained a polyadic and political message of encouragement to the *concordia civium*, which does derive from the Theban theme,²⁷⁸¹ our suggestion is that this is predominantly a representation of the moral aspect of the punishment of the wicked, with possible reference to the exotic worship, which had characterized the sovereignty of Thefarie Velianas and the unorthodox planning he conceived for the northern area of his sanctuary.²⁷⁸²

Abstract: The Archaic period on the one hand saw the retention of many traditions and technological accomplishments of the preceding eras, but on the other there were major innovations and developments of new artisanal products on the basis of a developing, dynamic urban culture. The special value of the blossoming and individuality of the Etruscan craft industries is also highlighted by Greek and Latin writers.

Keywords: bronze-working, pottery, jewelry, elites

Introduction

The Archaic period on the one hand saw the retention of many traditions and technological accomplishments of the preceding eras, but on the other there were major innovations and developments of new artisanal products on the basis of a developing, dynamic urban culture. The special value of the blossoming and individuality of the Etruscan craft industries is also highlighted by Greek and Latin writers.²⁷⁸³

Several factors are determinative for the development of the craft industries in the sixth and fifth centuries.

Economic development and the urbanization associated with it, which had begun in the Iron Age and the Orientalizing period, entered a new phase in the sixth and fifth centuries: the towns grew, and newly founded ones were laid out according to plan; there arose a complex system of subcapitals that structured the countryside. Within the towns, many sanctuaries were expanded and had a great need of handcrafted products for furnishings, rituals, and votive practices. Social change and the associated changes in burial customs led to a great need of objects for outfitting graves. But there was also more and more demand for items for (what are less well researched) private use and representations. A large number of handcrafted items were destined for festive banquets, which flourished under the influence of the Greek symposium in the sixth and fifth centuries.

New economic networks were established at the same time—both within Italy and for international trade—which also had their effects on handicrafts. Both political controversy and trade relations with Greek cities were intense; from them large quantities of products, as well as Greek merchants, slaves, and craftsmen, reached Etruria that inspired and changed Etruscan crafts. Relations were also close with Carthage, which likewise influenced Etruscan

manufacture, though to a lesser extent than Greece. Also important was trade with the Hallstatt cultures north of the Alps and in present-day France, for whom the Etruscans constituted an important conduit of Mediterranean culture, which in turn stimulated the creation of handcrafted items for export, particularly bronze beak-spouted jugs (*Schnabelkannen*).

Etruscan handicrafts exhibit a strongly eclectic character, on account of the close international connections. Because of the abundance of metal, since the Iron Age there had been a rich and flourishing tradition of bronze work, with highly individual forms, as well as a tradition of clay work, the introduction of the potter's wheel, and the development of impasto and bucchero. From the seventh century on, Greek forms were incorporated into these indigenous techniques. But new techniques were also developed, such as the black-figure painting of fine wares, and new materials were used, such as glass paste, which first appeared in decorative work in the sixth century.

We have very little information on the craftsmen, their social status, or their working conditions. We have a few signed works, and they offer nothing but the names. Excavations of workplaces carried out so far show that in most cases they were small operations, usually integrated into dwellings. An artisan's quarter proper, such as is known from Greek cities, has not yet been discovered. The situation is best known from the almost completely excavated town of Marzabotto. Alongside many small, specialized studios, there was a larger pottery, in which everything from roof tiles to statuettes was made, and a good-sized bronze workshop, which occupied an entire parcel of land. The discovery of kilns, work vessels, molds, tools, etc., makes it possible to reconstruct the manufacturing process.²⁷⁸⁴

The dating of handcrafted items is largely accomplished by associating them with well-dated imports—especially those with figural decoration—or by formal and stylistic analysis in comparison with Greek models. The coarse period labels “High Archaic,” “Late Archaic,” and “Early Classical,” which cover the era treated here, are correspondingly borrowed from the terminology of Greek archaeology.

An overview of craft production can be ordered by chronology and style; from a sociological point of view; or by function and genre. A combination of the last of these aspects with a geographic approach, however, recommends itself because of the distinct traditions and conditions.

1Bronze working

Bronze working always held special significance.²⁷⁸⁵ Thanks to the wealth of iron ore, copper, and silver found in the Tolfa Mountains between Cerveteri and Tarquinia and especially on the island of Elba and in Colline Metallifere (see [chapter 25](#) Zifferero), the Etruscans achieved considerable mastery of

metalworking, which continued to develop. The most important products are vessels, all sorts of utensils, weapons, and figurines.

Several parts of Etruria show rich production of bronze vessels, which for the most part exhibit native forms with little exposure to Greek influence. In the region in the Po Valley that from the seventh century was under Etruscan influence, there arose, beginning in the middle of the sixth century, major Etruscan cities – principal among them Felsina, modern-day Bologna. Also well excavated, besides Marzabotto, is the port city of Spina. In the sixth and fifth centuries these cities housed large workshops for vessels used in banqueting, the arrangements for which can be reconstructed primarily on the basis of funerary goods. One important form is the *situla*,²⁷⁸⁶ which is widespread from about 600 BCE in the Hallstatt area, the Este culture in Venetia, and Felsina, and which evidences contact with the northern neighbors. This is a large, somewhat conical “bucket” of beaten bronze sheets with movable handles, used for mixing wine and water and for storing other liquids. In the sixth century they are commonly decorated with figural friezes in repoussé that represent rituals and themes from the life of the upper class. The form developed further and in the fifth century is less conical and occasionally provided with feet. Other characteristic forms are the likewise large *stamnos* with horizontal handles on the sides and offset mouth, the biconical (Ger. *knickwand*) jug for ladling wine from the mixing vessel, and the bulbous jug with tall handles and round spout (*olpe*), along with several smaller forms of one-handed ladles and large flat bowls. A characteristic selection appears in the Tomba Grande in the necropolis of Giardini Margherita in Bologna from shortly before the middle of the fifth century BCE (Fig. 52.1), where Etruscan bronze vessels are supplemented by imported Athenian ceramic vases, a large volute-krater, and three drinking cups.

Very typical Etruscan bronze vessels of the sixth and fifth centuries were beak-spouted jugs (Ger. *Schnabelkannen*) (Fig. 52.2),²⁷⁸⁷ which were produced in the Tyrrhenian coastal town of Vulci. Featuring long, drawn-out spouts and often decorated with figures or animals at the mouth or on the handle, they were often exported to the Celtic realm, where the form was imitated and developed; there were also imitations in clay.

In the southernmost part of Etruria as well as in Campania, with its central city of Capua, which lay outside the core area and was not settled by Etruscans until the sixth-fifth centuries, there was an entirely distinct production of bronze vessels, of which the large cauldron provided with a lid and figural decoration was often used as a cinerary urn.²⁷⁸⁸

Fig. 52.1: Tomba Grande in the necropolis of Giardini Margherita in Bologna, before 450 BCE. Bologna, Museo Civico

In the aforementioned tomb in Bologna we can recognize additional bronze utensils that are especially typical of Etruscan banquets. On the floor lies a sieve for straining wine and a multi-armed torchière for illumination; to the right is a tall stand on which hung bronze ladles and the drinking bowls, and to the left a candelabrum on whose arms candles were affixed and which is crowned by a statuette. The main locus of manufacture of such objects was Vulci, which was also the source of many objects not only in Felsina, but especially also in the necropolis of Spina.²⁷⁸⁹ Another typical product of Late Archaic Vulci workshops is a tripod with rich figural decoration, such as the example in Karlsruhe (Fig. 52.3); the appliqué men below and the appliqué banqueting women above clarify the function of the stand for holding a

mixing vessel at festive banquets.²⁷⁹⁰

Fig. 52.2: Etruscan Schnabelkanne from the Rhineland, 500–480 BCE. Bonn, Akademisches Kunstmuseum, inv. no. C 623 (Photo museum)

The Etruscan relief-engravers achieved special mastery in the Late Archaic period of creating sheet metal with repoussé figures that decorated representative grave goods, including large tripods and the panels of battlewagons. Noteworthy examples are the wagons from Monteleone di Spoleto, now in New York, and from Castel San Mariano in Perugia, now in Perugia and Munich.²⁷⁹¹

Alongside the vessels and utensils, there was extensive casting of bronze statuettes, which were set up on freestanding stone bases and were dedicated particularly in the sanctuaries of northern Etruria.²⁷⁹² They come in many sizes and styles. While there are a certain number of well-made figures that follow Greek stylistic developments, depicting nude boys or clothed girls like Greek *kouroi* and *korai*, and sometimes also gods, there are also simple, schematic, stiff figures. The main manufacturing centers were in Vulci and the area around Chiusi and Orvieto. Even though they actually belong in chapter on art (see [chapter 51](#) Spivey and Harari), they were nonetheless made in the same workshops as the workaday bronzes and complete the picture of the flourishing craft in bronze.

Fig. 52.3: Tripod from Vulci, 500–480 BC. Badisches Landesmuseum Karlsruhe, inv. no. F203 (Photo museum)

2Jewelry

The expensive jewelry of the Etruscans was for the most part made of gold or silver-gilt.²⁷⁹³ The coastal towns—especially the southern Etruscan cities of Vulci and Caere—remained in the sixth century the most important producers of these luxury goods. Jewelry includes items worn directly on the body, such as hair clasps and hairpins, earrings, tiaras, chains, and rings, as well as elements of dress like fibulae, belt fasteners, pectorals, and other items that decorate clothing. The techniques and basic elements in themselves (metal, applying gold, wire, granulation, etc.) persisted from the Orientalizing period. But more strongly sculptural decorations appear in the sixth century, including those with mythological themes, and other materials become more common, such as colored glass paste or gems, in order to achieve a more colorful and intricate effect (Fig. 52.4). Alongside the old forms new ones are added, such as the widespread valise-type earrings (“a bauletto”) of Etruscan invention, the disk earrings of Anatolian origin, and a variety of new forms of ring, such as those with a cartouche-shaped setting.

Fig. 52.4: Set of gold ornaments from Vulci. New York, Metropolitan Museum, inv. no. 40.11.7–18 (after Cristofani and Martelli 1983, 158–159)

Cameos, mostly in the form of scarabs, were initially imports only,²⁷⁹⁴ but after 530 BCE, gem-cutters from eastern Greece immigrated to Etruria and established workshops that were soon creating characteristically Etruscan items, marked by specific formal shaping and a calligraphic style. The patterns are occasionally taken from Greek vase illustrations (Fig. 52.5). They were a component of gold jewelry and to an extent were also used as seals.

A group of small ivory and bone-tile reliefs is distributed in central Etruria in the area between Vulci and Chiusi;²⁷⁹⁵ occasionally they were also exported. They were clearly used on wooden caskets, since deteriorated, that were used to store jewelry and other objects. The reliefs usually show themes from aristocratic life like banquets (Fig. 52.6), dancing, hunting, and only occasionally mythological figures. From the stylistic point of view they constitute a good example of Greek-Ionian influence on the Etruscan workshops in the second half of the sixth century BCE, which can be seen in almost every type of artistic handicraft.

Fig. 52.5: Carnelian scarab from Perugia depicting the myth of the Seven against Thebes, 500–480 BCE. Antikensammlung Berlin

In interments of women, from the last quarter of the sixth century into the Hellenistic period, bronze mirrors have been found whose front is polished to a shine and whose back is commonly engraved with figural images. Every culture has mirrors; the engraving of these hand mirrors with ivory handles, though, is an Etruscan invention without direct precedent, and it clearly influenced Greece, where the phenomenon began only later. At first they were luxury objects, which at first were made only in small numbers; only in the Hellenistic period did mirrors spread into additional strata of society. The pictures show banquets, music and dance, and occasionally also mythological themes. These images represent one of the best sources for the Etruscan iconography of gods, since the figures are often provided with name tags. The most important place of manufacture was Vulci.²⁷⁹⁶

3Ceramics

More pottery survives than any other type of handcrafted item. Aside from the everyday ware, which generally was produced locally with local peculiarities, there are types of fine ceramics that have their roots in the seventh century but then flourished anew in the sixth century and were decorated with new techniques.

First of all is the typically Etruscan *bucchero*, which is burned black with a reducing flame and has a highly polished metal-like outer surface. The technique was developed in southern Etruria, especially in Cerveteri. The manufacture of “*bucchero sottile*” came to an end in the first half of the sixth century, but it developed into the “*bucchero pesante*,” which was made especially in the Chiusi-Orvieto region into the early fifth century.²⁷⁹⁷ The variety of forms is very great; they are mostly small vessels included in the banquetware: goblets, *kyathoi*, plates, amphorae, and tankards in many variations, often with sculptural decoration (Fig. 52.7). There are also sometimes imitations of utensils, such as braziers, as well as ladles and others. They usually have Etruscan shapes; only occasionally are Greek vase forms imitated in *bucchero pesante*. The sculptural decoration is achieved with stamp seals, cylinder seals, and appliqué, which can also be figural.

As for figure-painted pottery,²⁷⁹⁸ the imitation of the Corinthian models continued into the third generation, primarily in the form of little ointment containers, until the middle of the sixth century. Also during this period, the stream of Corinthian, East Greek, and Laconian ware into Etruria dried up; almost nothing but Attic vases was imported. For one thing, emigré craftsmen from eastern Greece were now working in Etruria, who made e.g. the “Caeretan Hydriae” or the “Dinoi Campana” on the spot. In their circle, shortly before 550 BCE, the first Etruscan workshop was then established in Vulci for black-figure painted pottery, known as Pontic vases. As for the well-known signed amphora of the founder of the workshop, the Paris-painter, which was found in Vulci and is now in Munich (Fig. 52.8), its eclectic character is easily recognized. The style of the figures, the color, and the ornamentation of the meander interrupted by stars show very strong influence from eastern Greece, whereas the shape of the vase and the preference for mythological subjects, in this case the Judgment of Paris, are due to the influence of Attic pottery. After the still rather limited quantities made by this

first generation, the second generation in the last quarter of the sixth century moved to mass production. The largest workshop of this period is the Micali-painter's, who likewise was established in Vulci. The style assimilates Attic elements more and more strongly, and the quality of firing and painting diminishes. In the third generation, in the first quarter of the fifth century, branch workshops were established in Orvieto and/or in the area of Chiusi; the graphic quality clearly decreases; often it is nothing but pure silhouette-painting. By far the most popular form is the necked amphora, which had earlier been the favorite shape for the Paris-painter. Aside from the manufacture in the heartland, there were still a few workshops for black-figure vases in Capua in Campania.²⁷⁹⁹

Fig. 52.8: Amphora from Vulci depicting the Judgment of Paris, 540 BCE. Munich, Staatliche Antikensammlungen, Inv. 837

Red-figure painted vases, made in Athens since 530 BCE, were indeed imported in great number, but only put into local production quite late, since they are technically much more complex to make. In the second quarter of the fifth century, however, the black-figure vase workshops developed a pseudo-

red-figure vase process, which does not leave the figures blank, but paints them in color over the black glaze.

Fig. 52.9: Relief of a cinerary urn from Chiusi, ca. 500 BCE Antikensammlung Berlin, inv. no. Sk1222

An important area of the potters' business was the manufacture of terra-cotta roofs, i.e. tiles, entablature cladding, pediments, etc.²⁸⁰⁰ Around the middle of the seventh century the custom of clay roofs spread through Etruria and in the course of the sixth century became the rule, so that major tile-makers sprang up in every town. Eaves and the cladding for wooden entablatures in temples, public buildings, and a few magnificent private residences were lavishly painted or decorated with mold-made reliefs.

Small terra-cotta sculptures, so numerous in sanctuaries throughout the Greek world, are very rare in comparison with bronze figures in Etruscan sanctuaries before the fourth century BCE.

In the realm of lavish funeral rituals, there arose some new developments of new forms of burials: sarcophagi, cinerary urns, cippi, altars. Various locally available materials were used: primarily clay, but also several kinds of stone,

such as limestone in Chiusi or nenfro in Vulci; marble, which was not systematically sought and quarried before the Augustan era, was used only in rare, exceptional cases.

Of special note is the large group of Late Archaic objects of soft limestone that were made in Chiusi.²⁸⁰¹ These include, among other things, sarcophagi and urns in the form of chests or houses, whose sides bear panels in relief. The themes of these often very high quality items reflect the values of the local upper class, as they also appear in the wall paintings and other genres of the time: hunting, banqueting, dancing, sport, battle, as well as specifically funereal themes such as laying out and mourning the dead (Fig. 52.9).

In southern Etruria, on the other hand, in the sixth century new sarcophagus and urn forms in terra-cotta developed, on which the deceased is portrayed lying on the lid, participating in the banquet. Among the well-known examples are the sarcophagi of a married couple from Caere now in the museum of the Villa Giulia in Rome and the Louvre in Paris.²⁸⁰²

After the rich and flourishing and very varied production of Etruscan products in the Archaic and Early Classical periods there is a change taking place in the second half of the fifth century BCE. Due to the political situation the Etruscans do not dominate the trade in the western Mediterranean anymore, they lose control over the cities in the Po Valley and in Campania because of the Celts and the Samnites. This effects a certain decline in production in many cities which restarts again with different premises over the course of the fourth century.

53Society, 580–450 BCE

Abstract: The sixth and early fifth centuries BCE were a period of flourishing economies in many city-states of Etruria. The urbanization phenomenon came to the fore and was consolidated. In the major coastal cities of the south beginning in the second half of the sixth century there must have emerged an upper class (consisting of old and new aristocracy), an urban middle class, and a sort of proletariat, although little is known about the latter. A well-developed system of retinue – serving as social glue between the different classes – must be presumed. A broader urban upper to middle class exhibit some settlements in the interior (Orvieto, Chiusi). The gentilicial system was relegated to the background by the timocratic order.

Iconographic and epigraphic sources provide glimpses into the social structures of the individual city-states, which all had their own typical traits. The archaic wall paintings of Tarquinia are considered private expressions of an urban aristocracy, which display interest in communal cult celebrations and banquets intended to strengthen internal cohesion, while the military element hardly plays any role in the iconography of these Late archaic tombs. It may be that new military strategies, like armies of hoplites and battle in well-ordered lines, offered the individual aristocrat less possibilities for self-representation. In the course of time, the banquet iconography that had previously been rich in variation fossilized; this is to be seen as an indication of walling off and an emergence of a consolidated (and gradually more closed) noble class. On the other hand, the figure of the warrior in less elitist-aristocratic funerary milieus of the sixth and fifth centuries continued to be of great importance, as shown by the reliefs in Chiusi, the grave *cippi* of Orvieto, and the grave stelae with reliefs in and around Fiesole and in northern Bologna, the last ones already radiating a strongly urban mentality. The capability of the warrior to equip himself appears to be of central significance, also with regard to the possibility of his having a voice in political affairs.

The consolidation of the timocratic-republican structures brought a clearer exclusion of women from the public realm and increased their concentration on the domestic sphere, although regions differ according to individual sociopolitical circumstances. While the tomb inscriptions placed over the entrances of the Archaic chamber tombs at Orvieto as a rule name only one man related to his function as *pater familias*, the ideology of nobility and high-status thinking prevented a complete marginalization of the female element in Tarquinia. The idea of the married couple as the reproductive nucleus of society still held significance and thus also the representation of the wife as partner of the husband and mistress of the house.

The presence of foreign-born merchants and craftsmen, especially Greeks, promoted by trans-regional opening of the markets and attractiveness of the coastal cities is clear. They lived on the spot as free resident aliens or non-free workers, while vertical social mobility in the sense of full integration into the body of citizens happened rather rarely. Something similar probably also held in this period for Italics, whose presence in Etruria, though, generally goes far beyond our chronological horizon and created the most varied forms of integration.

Keywords: aristocracy, urban middle class, wall paintings, women, foreigners.

1 General lines of development in the individual city-states

The period between 580 and 450 BCE saw a flourishing economy in many Etruscan city-states, especially in the south and the coastal regions; a considerable broadening of the Etruscan trade network even beyond Italy is noteworthy. In the major centers of settlement, the phenomenon of urbanization had been achieved and was gradually extended. Although the interaction between the various social strata in the Archaic period remains very poorly understood, in the large coastal cities in the second half of the sixth century there must have emerged an upper class (consisting of old and new aristocracy), an urban middle class, and a sort of proletariat; some settlements in the inner parts of Etruria seem to exhibit a broader urban upper-middle class. The *genti-licial* system (i.e. a system dominated by *gentes*) was relegated to the background by the timocratic (propertied) order, but continued to exist, especially in the south. Even though in this period as a rule city-states were organized in a republican fashion, with regularly changing office holders belonging to the local upper class, indications of the temporary presence of “kings” or tyrants between the sixth and fourth centuries are nonetheless not unknown (I refer to Thefarie Velianas of the Pyrgi gold tablets, the figure of Porsenna from Chiusi,²⁸⁰³ or the reintroduction of monarchy at Veii mentioned by Livy 5.1.3). In the second half of the sixth century, the increasing competition between Etruscans and Greeks led to serious military engagements, which at first had no serious consequences either for the close economic relations or for the important cultural model provided by Greece. This changed only toward the end of the period under consideration here.

This is the background against which the social structures of Etruria continued to develop, with each Etruscan city-state representing an independent unit, what is also seen in the distinct material legacies of the individual centers. The increase in homogeneous and sometimes extensive iconographic and epigraphic corpora in the Archaic period provides a relatively good basis for assessing social structures, particularly as these corpora reflect differing social levels in the city-state. The rich complex of wall paintings from the chamber tombs of the Monterozzi necropolis at Tarquinia should be seen as having been commissioned by the local aristocracy. They began—after a few forerunners—around 540 BCE (of altogether approximately 6000 chamber tombs discovered only 2–3% are painted²⁸⁰⁴). Chiusi is distinguished by its numerous stone reliefs on plinths, urns, *cippi*, and (occasionally) sarcophagi, which were used for the individual burials of an aristocratic, though not particularly elitist, class, and date to between the third quarter of the sixth century and 470/450.²⁸⁰⁵ Only in the late sixth and especially the first half of the fifth century is a local oligarchy

identifiable, which on the model of Tarquinia commissioned tombs with figural paintings (in this case multi-chamber tombs). The Archaic chamber tombs at Orvieto (Volsinii veteres) were laid out in regular rows, relatively small and kept rather simple within; at the outside the inscriptions identify the inhabitants. These tombs are the expression of a broad upper class, based not only on land ownership but also on trade and the possession of workshops, which presents itself as an orderly whole, organized on a relatively egalitarian basis,²⁸⁰⁶ which came fairly close to the Archaic Greek *polis* model of a community of citizens (in fact painted chamber tombs immediately surrounding the city date from not before the mid fourth century).²⁸⁰⁷ A developed urban mentality radiates from the pictorial corpus of the horseshoe-shaped funeral stelae from Felsina (Bologna) in the Po area, which were produced between the beginning of the fifth and the early fourth century.²⁸⁰⁸ With regard to material and methods, settlement archaeology (e.g. at San Giovenale, Acquarossa, Lago dell'Accesa, Marzabotto, Spina, Vetulonia) opens up other approaches to the theme;²⁸⁰⁹ coastal cities like Caere, Tarquinia, and Vulci as well as interior centers such as Chiusi and Orvieto, however, have not yet provided many access points in this regard.

The iconographic material from the funerary realm is naturally highly representative and from an eschatological perspective orbits the central features of the social life of the deceased. In Late Archaic Tarquinia, these amount to banquets and symposia, revelry (Gk. *komos*) and dance, physical fitness and public games, and cultic celebrations and hunting.²⁸¹⁰ In most cases the Late archaic tombs are relatively small with one chamber²⁸¹¹ thought to be for the nuclear family; by means of the paintings the local nobility celebrated a sort of self-representation in the private sphere. Common cult celebrations strengthened the horizontal connections and the inner solidarity between the single *gentes*, as is to be gathered from the Tomba delle Iscrizioni (Tomb of the Inscriptions, ca. 520 BCE).²⁸¹² Only males are represented, who probably belonged to a group of persons sharing same interests, perhaps on the model of the Greek *hetairiai* (Fig. 6.1.). The unusually numerous labels for the men record the various *gentilicia* of the participants (*ET² Ta 7.13–29: Matve, Aniiē, Punpu, Tētiē, Vinacna, Recieniiē, Fanuru*); *Larth Matves*, the leader of the lively *komos*, should probably be recognized as the owner of the tomb. The youthful rider *Laris Larthiia* could be his son; horsemanship was often a pastime of young noblemen.

The favorite motif of Etruscan wall painting of the sixth to fourth centuries was, however, the banquet itself, on which great significance is bestowed in Etruscan funerary art in general.²⁸¹³ It symbolizes a positively engaged, desirable pastime. Icono-graphic models from the Greek world (Ionic, Attic) here too played an important role, but they were transformed against the native background according to the ideas of the tombs' owners in order to convey their own meanings corresponding to Etruscan social structure; this also includes the participation of the wife/wives, which in principle was not

forbidden or unusual. While the second half of the sixth century was remarkably innovative and open to experiment, as concerned the number, gender, and position of the participants in the feasts, from about 500 on the type of the collective banquet on *klinai* was established, with in many cases mixed-gender participants on three to five couches (the Tomba del Vecchio or “Tomb of the Old Man” is one of the earliest examples²⁸¹⁴). With this banquet type the tomb’s owner demonstrates his belonging (and that of his *oikos*) to a social elite. Its standardization is evidence for an increasing rigidification and walling off of the ruling class during the early fifth century, and the emergence of an established, yet relatively broad aristocratic oligarchy in Tarquinia.

Aside from the weapon dance (*pyrrhic* dance) in the context of athletic games, the ideology of the warrior plays only a very modest role in the pictorial repertoire of the Late Archaic and sub-Archaic chamber tombs of Tarquinia. This concentration on the peaceful side of aristocratic life along with far-reaching suppression of the warlike element—at least in the depictions (the associated grave gifts, among which we can assume were weapons, are unfortunately mostly lost)—appears to have been a deliberate decision in the second half of the sixth and first half of the fifth centuries. It perhaps had to do with battle techniques—such as the hoplite army and fighting in an ordered formation called the *phalanx*²⁸¹⁵—which in contrast to earlier times gave individual aristocrats less opportunity for self-representation. Speaking in favor of this is the fact that the figure of the warrior was granted yet higher status in the less elitist-aristocratic funerary milieu of the sixth and fifth centuries. The funerary reliefs from Chiusi show some (albeit not many) representations of fully armed warriors.²⁸¹⁶ Especially in Orvieto, helmeted warrior heads served as tomb *cippi*, and at least one stela and one *cippus* depicting a warrior are also known from there.²⁸¹⁷ The warrior is a well-known motif in the interesting group of grave stelae and cippi from Fiesole and its territory.²⁸¹⁸ It appears to be a matter of people who defined themselves above all through their military service,²⁸¹⁹ possibly as warriors or full citizens, who could equip themselves with weapons on their own. The warrior’s ability to outfit himself is a significant fact in connection with his having a political voice and thus with his social status, as clearly emerges in the Roman tradition.²⁸²⁰ It contrasts with soldiers who had to be outfitted by their patron. A group of bronze helmets of the Negau type belonging to the fifth century, found in 1905 in a deposit on the *arx* of Vetulonia, could be interpreted in this way.²⁸²¹ On the basis of the inscription *haspnaś*, found on at least fifty-six of the helmets, they appear to be equipment that remained in the possession of the *gens Haspna*.

The phenomenon of the warrior stelae in the Archaic and Classical periods was mainly limited to inner and northern Etruria; warrior representations are also found on the grave stelae from Felsina (Bologna), which reflect urban-citizen mentality, and indeed on both the simpler examples and those of the

ruling upper class.²⁸²²

Weapons as grave goods in men's tombs are also known in Archaic southern Etruria. An interesting example is the Tomba del Guerriero (Tomb of the Warrior) in Vulci, from the last quarter of the sixth century. Besides a complete set of equipment for a hoplite, it also contained one Panathenaic amphora.²⁸²³ Without a doubt, it contained a high-ranking person, a sort of *promachos* or military leader (perhaps along the lines of the Vibenna brothers, whom the literary tradition and the pictorial decoration of the François Tomb describe as leading figures/condottieri); the warrior's origin and his relation to the local noble families remain, however, unclear.

The economic circumstances of the deceased were generally not a theme in the funerary art of this period, although some few exceptions may exist. In the Tomba della Nave (Tomb of the Ship, 480–450 BCE) in Tarquinia, for example, the depiction of the ship can be interpreted as an allusion to the livelihood of a ship owner, but also as a reference to the journey to the world beyond (Fig. 51.8).²⁸²⁴

Besides the maintenance of horizontal relationships within the upper class, in the Archaic period the very poorly documented system of *retinue* also must have played an important role. The clientele system that was usual at the same time in Rome was based on the principle of *fides*. The patron had to protect and to support his clients, and in return the client assisted the patron in his economic, political, and military interests (cf. e.g. Law of the Twelve Tables 8.21). The Casa dell'Impluvium in Roselle, built around the middle or in the third quarter of the sixth century, illustrates the significance that accrued to the horizontal and vertical strands of the fabric of social relationships of a Late Archaic noble lord.²⁸²⁵ A large part of the 330 m² building consists of an entrance hall, an atrium-like inner court, and an adjoining banquet hall, identified by the many drinking vessels found within; in contrast to this, there is a rather small, secluded "private area". The increasing significance of representational duties in the house itself appears to have influenced the development of domestic architecture around the middle of the sixth century.

2Place and role of the female element

As has already been mentioned (see chapter 12 Amann), gender roles were defined traditionally in Etruria, although separation of the female element was not a goal, at least in principle. This is exemplified by women taking part in the common meal/banquet,²⁸²⁶ women as spectators at public games,²⁸²⁷ the general esteem accorded to wives and the family overall, as well as the care for daughters. A certain level of education is thus indicated by the Etruscan mirrors, with their sometimes inscribed depictions of Greek myths, which were produced primarily for a female audience.²⁸²⁸ The space for female

development, however, was subject to the respective sociopolitical situation. Beginning from a stronger presence of the female element in the Orientalizing period, increasing marginalization in the sixth and fifth centuries can be discerned. The consolidation of the timocratic-republican structure led to women's displacement from the public realm and an increased concentration on the domestic sphere.²⁸²⁹ Comparison of the relief friezes of Murlo and Acquarossa makes this clear. Whereas the terra-cotta decoration of the residence at Murlo (ca. 580 BCE) still clearly stands in the Orientalizing tradition of women taking part in the princely feast, the reliefs of the large house-complex in Zone F in Acquarossa, dating to the third quarter of the sixth century, concentrate on chariotry with warriors and the mythological figure of Herakles, the orgiastic *kōmos*, and the strictly male feast, which features no female figures at all. This is characteristic also for the architectural plaques from Tuscania/Ara del Tufo (ca. 550).²⁸³⁰ The heroic figure of Herakles now appears necessary for legitimizing the power of specific *gentes* and especially their leaders, whose military strength is stressed. In parallel, the disappearance of the (mortal) woman from these banquet scenes must be seen as an index of a new sociopolitical organization in which associations of men of an Archaic-urban stamp played an important role. Marginalization of women can also be recognized in tomb inscriptions in the necropolises of Orvieto (second half of the sixth-first quarter of the fifth century). The inscriptions on the outer façade over the entrance of the tombs, clearly addressed to the external world, as a rule name men,²⁸³¹ while the relatively small chamber tombs probably served for the nuclear family (possibly including select servants). The *pater familias*, who was a full citizen and a warrior, outwardly represented the (nuclear) family, while the wife remained unnamed. An interesting non-funerary epigraphic complex is represented by the Archaic votive inscriptions in the extra-urban Porto-naccio sanctuary of Veii, in which only one woman is attested amongst the dedicators (and this is not absolutely certain).²⁸³² While female votive statuettes and dedicatory gifts having to do with fertility, birth, and children's welfare refer to female piety, epigraphic traces of them are rare in the Archaic period. Including the aforementioned inscription, between the beginning of the sixth and the middle of the fifth century we know of only three to four dedicatory inscriptions of a more complex nature provided by women,²⁸³³ in one case the donor was a *lautenitha* (see below). References to political or sacred offices are generally rare in inscriptions of the Archaic period and not attested in connection with women. The archaeological and iconographic material in the Archaic period, moreover, offers very little information with regard to cult-relevant women or priestesses.²⁸³⁴

Etruscan funerary imagery shows clear differences in the presentation of the female element, as conditioned by the sociopolitical background of the clients and the type of monument. The wall paintings displayed within the family tombs of the wealthy metropolis of Tarquinia were not intended for the

general public but served for the self-definition of the tomb's owner within the bounds of aristocratic family ideology. Alongside high-status thinking there was also the capability to reproduce progeny that formed part of this ideology of nobility. Hence, the idea of the married couple as the nucleus of society took on significance especially in the face of death, as did the depiction of the wife as the husband's partner and high-ranking mistress of the house. The banquet scenes in particular show quite different interpretations of the basic theme. The well-known paintings in the pediment of the rear chamber of the Tomba della Caccia e della Pesca (Tomb of Hunting and Fishing, ca. 510 BCE)²⁸³⁵ with reclining couple on mattresses are rather concerned with the erotic aspect of the marriage relationship and—via allusion to Dionysos (and Ariadne)—aim at a certain elevation and heroization of the tomb owner (the societal reservations against heroization of normal mortals operating in Classical Athens were less strong in Etruria). The Bar-toccini Tomb (ca. 520),²⁸³⁶ depicts the dignified *mater familias* seated on her own chair, following a pictorial model widespread in the eastern Mediterranean, and emphasizes the tomb owner as legitimate *pater familias* and presider over a well-ordered *oikos*.²⁸³⁷ From about 500, there then evolved the aforementioned canonical banquet type, which shows the decently dressed wife at the collective banquet amongst equals reclining alongside her husband on the couch. Enjoying wine in public seems to have become unfashionable for them during the sixth century,²⁸³⁸ which is similar to what happened in Rome. The motif of the mother with a small child generally had no importance in wall paintings (this aspect took on weight in funerary art only from the late fifth century onwards). It must be emphasized that beside these mixed-gender banquets, purely male parties were normal too in Tarquinia from the beginning (thus, for example, the *symposion* like party with participants lying on mattresses in the Tomb of the Lionesses, ca. 520, and the drinking feast on *klinai* in the Tomb of the Chariots, 490/480);²⁸³⁹ the message that the individual tomb owner wished to transmit with the painting was indeed decisive.

Naturally, gender-specific distinctions come to light more strongly in the pictorial repertoire of the reliefs from Chiusi, which mostly relate to individual burials. Unfortunately, the original archaeological context of these monuments is missing. To the female sphere in the Late Archaic period belong scenes having to do with the funerary ritual (especially *prothesis* scenes—including women as mourners—can be frequently found²⁸⁴⁰), a kind of gathering of women, and a few reliefs that may represent marriage rituals.²⁸⁴¹ Oriented in the male direction are warriors and fighting scenes, the banquet (often with exclusively male participants),²⁸⁴² athletic contests and the hunt, as well as gatherings of men. The pictorial repertoire on the whole reflects a broader, urban-style social class with a clear division of gender roles. This social model also continued in the painted chamber tombs of the first half of the fifth century, where banquet scenes are found five times,

always with exclusively male banqueters.²⁸⁴³ More recent, but comparable to an extent, are the grave stelae from Felsina/Bologna. For men, these stress civic and military functions, while the pictorial repertoire for women is substantially more limited, referring to a woman's married or unmarried status and strongly concentrating on the theme of the journey to the underworld (which in Bologna was important).²⁸⁴⁴ The banquet motif significantly no longer plays any major role in this group of monuments (even if the idea of banqueting is still present through grave goods).

Activities from the woman's domestic sphere are entirely absent from the pictorial repertoire of Etruscan vase painting of the second half of the sixth and first half of the fifth centuries, which instead tended to portray Greek mythology, and furthermore was mainly oriented toward the aristocratic-masculine world.²⁸⁴⁵

3 On the integration of foreigners

Etruria's involvement in the international trade and the attractiveness of its prosperous metropolitan centers with their eager-to-shop inhabitants led, from the early sixth century, to an increased presence of foreigners, especially Greeks, Phoenicians/ Carthaginians, Italics, and—occasionally—Celts. In the major harbor settlements, the local authorities initially encouraged the presence of foreign merchants, especially Greeks and Phoenicians/ Carthaginians. Inscriptions from sanctuaries in port towns like Gravisca (with many Greek dedicatory inscriptions, including the Sostratos anchor)²⁸⁴⁶ and Pyrgi (with its famous gold tablets) suggest some kind of integration rather than separation, at least in the cult practise. Further epigraphic evidence such as the *tesserae hospitales* from a wealthy tomb in the Santa Monica necropolis in Carthage and from the St. Omobono district in Rome attest to agreements based on the principle of hospitality with foreign merchants around the mid sixth century.²⁸⁴⁷ In the earlier periods legal integration into the citizenry, at least for the foreigner's descendants, appears possible on an individual basis, as indicated *inter alia* by the Celtic ancestor of the *Katacinagens* in Orvieto (*ET² Vs 1.165*).²⁸⁴⁸ With consolidation of the ruling classes, however, vertical social mobility generally became more difficult beginning in the sixth and especially in the fifth century. Thus Lucumo, the son of the wealthy Greek Demaratos and an Etruscan noble woman, according to the tradition was not entitled to political offices in Tarquinia (Livy 1.5; Dion. Hal. *Ant. Rom.* 3.47.1–2).²⁸⁴⁹ Economically powerful foreigners probably lived as free persons in Etruria, in the manner of *metics* (resident aliens) or *peregrini* without political rights; in the mature phase, however, most of the Greek sea merchants did not belong to the upper social class.²⁸⁵⁰ From 470–450 the presence of Greek merchants in the Etruscan core area diminished (as is clear

e.g. in the sanctuary of Gravisca), and shifted further north toward the Po delta, with especially Spina exhibiting a considerable Greek presence.

Among the artisans of foreign origin, the situation was complex and must have ranged from slaves (defined by their unfree personal status) to free foreigners to perhaps fully integrated citizens. While foreign craftsmen in the Orientalizing period (see [chapter 34](#) Botto) probably reached Etruscan aristocratic residences as non-free part of the gift trade, in the Archaic period East Greek emigrants played an important role. This becomes clear in the vase paintings (the group of the Caeretan *hydriae* is thus the product of one or two East Greek potter-painters who settled in Caere, for example) and also in the wall paintings of Tarquinia. The artisans worked in organized workshops, with a workshop master and both free and non-free craftsmen of both foreign and Etruscan origin (see below). Their signatures attest from early times to a certain individual pride in craftsmanship. An important center for Etruscan vase painting was Vulci, where between 480 and 460 BCE the Greek vase painter *Praxias* (probably from southern Italy or eastern Sicily) had settled down and was maybe legally well integrated (if the supposed man's name *Arnthe Praxias* is in fact present; this, however, is currently the subject of much discussion).²⁸⁵¹ The Greek craftsman *Metron*, named by the Etruscan artists' signature *metru menece* on a red-figured *kylix* from Populonia (450–440; *ET*² Po 6.1), was probably free, but not a citizen.²⁸⁵² Since there is no own *nomen gentile*, but also no patron's *gentilicium*, he will have been a kind of *métoikos* (resident alien).²⁸⁵³

Prisoners of war and other prisoners often lost their personal freedom and served their masters as slaves, primarily in private households and in factories/workshops. From the Twelve Tables (3.5) we learn that after a specified period had elapsed, Roman debtors, even in the middle of the fifth century, could still be killed or sold *trans Tiberim peregre*—probably meaning to Etruria. But large-scale slaveholding was not found before the fourth century; in agricultural production, foreign slaves played no significant role in pre-Hellenistic times.

A statue base from the last quarter of the sixth century that was discovered in 2008 in the Campo della Fiera sanctuary near Orvieto is of special interest.²⁸⁵⁴ The inscription records as the donor a female person named Kanuta, *lautenitha* (= freed-woman) of the Larecena family and wife of Aranth Pinie. *Kanuta* could be an Italic -Oscan name; the Etruscan *nomen gentile larecena(s)* is found in the Crocifisso del Tufo necropolis (*ET*² Vs 1.51). This is a fairly large base (ca. 80 x 50 x 40 cm) for a standing bronze figure that represents a rather costly dedication, which documents the social rise of a formerly unfree or at least subordinated woman that was achieved by marriage. The inscription represents by far the earliest attestation of the term *lautni(tha)*;²⁸⁵⁵ it is unclear whether the archaic form is to be understood in the classical sense of *liberta*, or of *familiaris* (= belonging to the family). A kind of liberation from the patron's power must be accepted in any case. Let it

be stressed that Old Italic, and especially Sabellic, onomastic material is richly documented in Etruscan inscriptions since early times, and demonstrates various forms of integration, not excluding (especially in the early and, again, late periods) full citizenship.²⁸⁵⁶

Natives, too, could have the status of a dependent or even an unfree person. In the urban craftsman milieu this is assumed on the basis of the suffix *-ša* for the vase painter *kape mukathesa* = “Kape, belonging to Mukathe” (amphora from the Vulci workshop of the Micali Painter, ca. 500, *ET*² Vc 6.1) and perhaps also for *aranth hera-canasa* = “Aranth, belonging to Heracana” (?), known from the Tomb of the Jugglers at Tarquinia (530–520, *ET*² Ta 7.12).²⁸⁵⁷ Dependency relations existed between parts of the Etruscan rural population and the land-owning upper class, but are difficult to define in their concrete legal dimensions because of the lack of sources. Nevertheless the existence of a free peasantry with moderate land ownership in the later sixth and fifth centuries must also be considered. Of especial interest is the bucchero inscription of *Laris Pataras* from Casale Pian Roseto in the territory of Veii, whose binomial name perhaps reveals to us the owner of the farm.²⁸⁵⁸

From the mid fifth century on, especially in the coastal cities of southern Etruria, there arose severe problems of an economic and probably also domestic political nature. This brought about new conditions, undoubtedly affecting social organization.

54Ritual and Cults, 580–450 BCE

Abstract: The rites and worship of the Archaic and Classical periods can be studied by focusing on the increasing Hellenization of Etruria that began in the eighth century. First, the ways in which this Hellenization took place are explained, paying particular attention to the sanctuaries of emporia like those of Gravisca and Pyrgi. Then we show how this Hellenization took shape in the widening pantheon and in the sacrifices being performed that were meant for an extended family circle. Lastly the conception of the beyond, human sacrifices, and city religious planning are considered as limits to Hellenization.

Keywords: Sacrifices, deaths, emporia, beyond, pantheon

Introduction

During the Archaic and Classical periods, Etruscan rites and worship experienced a profound transformation, but we do not know the details. Indeed, not only does no literary text describe the Etruscan religious rites and practices of the time, but the Archaic and Classical inscriptions, while decipherable, are difficult to understand. We should therefore base our interpretation primarily on archaeological sources to try to give an account of what seems to be the most striking fact of the Archaic and Classical periods: the continuation of the Hellenization of Etruscan practices and rituals that had been in progress as early as in the eighth century BCE.

1The paths to Hellenization

The paths to Hellenization are many. The essential factor seems to have been the contacts made between the Greek and Etruscan aristocracies. As Mario Torelli writes,²⁸⁵⁹ “Etruscan society found its ideal counterpart in Greek civilization, which was soon adopted as a model for emerging aristocratic social setup styled on the Greek poleis.” During banquets and ceremonies mixing Greeks and Etruscans, the oral transmission of Greek songs, legends and epics took place. The important Greek texts and myths were, it seems, recovered by Etruscans for local use. By definition, the signs of this oral tradition are difficult to perceive, but their transcription is visible in the form of figural repertoire on Etruscan artifacts, which is tantamount to observing the material forms of this transmission.²⁸⁶⁰ The links between Etruscan and

Greek aristocrats might also have materialized by setting down offerings in the big Pan-Hellenic sanctuaries of Delphi, Olympia and Dodona, where Etruscan bronze weapons and vases of the eighth and early seventh centuries have been discovered.²⁸⁶¹

In the Archaic period, contacts between Greeks and Etruscans materialized through the granting of specific areas, called *emporìa*, for trade with foreigners. The model seems to be Naucratis in Egypt, on a branch of the Nile, where Pharaoh Amasis granted the Greeks the right to trade.²⁸⁶² In these *emporìa*, as at Naucratis, a space was left for sanctuaries, where foreigners were allowed to practice their religions. These *emporìa* that were also open to the Etruscans were used as vehicles for spreading foreign religions, mostly Greek, all across Etruria.

The best-known Etruscan *emporìa* are those of Gravisca and Pyrgi where excavations have been carried out since the 1960s and are still producing surprises. Taking these two examples, we will try to identify the particular forms taken by worship and rituals in the Archaic and Classical periods under the influence of Hellenization. Gravisca is perhaps the most ancient Etruscan *emporium*.²⁸⁶³ among its customs were Greeks who sought metallurgical products as early as the late seventh or early sixth century. Recent excavations have shown that several dozen smelting furnaces were active in the sanctuary as early as in the sixth century and that a ring of a dozen furnaces surrounded the Archaic *sacellum*. This metallurgical activity had probably a religious value for the Greeks, who honored Hephaistos as a multi-talented god—magician, doctor, shaman, metallurgist and seer. The melting of metal, at that time, was associated with sacrifices. The cavity of a furnace was filled with a layer of sand, which contained the remains of sacrifices, animal bones, burnt wood, fragments of a ceramic *impasto* olla, and a miniature Corinthian cup.

The association between metallurgy and religion was an argument for an identification of the first cult goddess with Aphrodite, wife of Hephaistos, and for the opening of the sanctuary by the Phoenicians. The latter are said to have offered a *dinos* in the wild goats' style dating from 620–610, a bronze cauldron, and a statue of an armed goddess as an inaugural gift for the “opening” of the *emporium*. The presence of foundries attracted many Greeks—often Ionians—until the late fifth century. At the end of the sixth century, dedications of Aeginetans appeared among the inscriptions; in the late sixth century, Sostratos from Aegina dedicated an anchor to Apollo. This Aeginetan may be the same who made a dedication to Aphrodite in her sanctuary of Naucratis and who grew rich by selling Attic vases and probably slaves, food products and metals. The dedications also suggest a certain number of middlemen, *naukleroi* and *phortegoi*, such as Hyblesios, a very rare name in Greek onomastics, which is also the name of a native dedicator on an Attic black-figure cup (band-cup) found at Naucratis.

At Pyrgi, on the territory of Caere, the *emporium* received western Phoenicians. Excavations have unearthed a Phoenician-language inscription,

attesting the existence of direct links between Caere and western Phoenicians in the 500s that resulted in a major building program, which apparently made Pyrgi the most important Etruscan sanctuary with two large, prestigious temples (Fig. 18.12). Indeed, in 1964 a triptych of gold laminate plaques bearing bilingual inscriptions was found (Fig. 35.2). The two languages were not, as one might have expected, Etruscan and Greek, but Etruscan and Phoenician, and attested the dedication of Archaic Temple B by Thefarie Velianas, ruler of Caere, to Astarte (the Phoenician mother-goddess) and Uni (the Etruscan Hera). Spectacular as it may have been, the Phoenician inscription should not conceal the extraordinary pervasiveness of Greek influence at Caere. True, the Phoenicians were military allies and trading partners and were therefore granted one or more places of worship, but they do not seem to have been the main and continuous reference inside the sanctuary. When the Phoenician inscription was made and displayed between 510 and 490, the Greek model was obvious, for example, in the architecture of Temple B; the Greek model still prevailed between 490 and 480, for the erection of Temple A.

Temple B, whose antefixes celebrate the sacred marriage of the Phoenician goddess, was designed as a compromise between Greek and Etruscan architecture. The peripteral plan of the temple in fact conforms to Greek models; it is built according to a unit of measurement of 0.296 m, which corresponds to the attic foot that was officially adopted in Athens at the time of Solon. Specifically, the influence could be Siceliot because these features are reminiscent of the temples of Selinunte: the plan and proportions of the *adyton*, the fact that it was probably raised, and the vast area covered by lateral porticoes versus the cramped area of the cella. In addition, Temple B borrows some of its patterns from Greek culture. The attachment to Greek themes can be seen in some fragments of the ridgepole and of the *mutuli* of Temple B that represents a mature man, a younger man, and a many-headed hydra—the victory of Hercules helped by Iolaus over the hydra of Lerna—and in acroteria depicting charioteers of the two heroes and in the short sides of the temple showing the labors of Heracles. According to the legend, on the way back from the kingdom of Geryon Hercules stopped several times on the Etruscan coast, especially near Pyrgi. According to Ovid (*Fast.* 6.501), he had the opportunity to snatch Leucothea and Palaemon from furious Italic Maenads, and then assigned them to the Penates.

In Temple A, the use of the representation of Greek myths seems to be meant to relate the city of Caere to idealized origins.²⁸⁶⁴ Temple A is thus decorated with references to Greek myths playing on equivalences between past and present. In the late fifth century, on the great *mutulus* with relief of the back pediment, scenes of the Theban myth were represented: the duel between Tydeus and Melanippe, and Capaneus killed by a thunderbolt from Zeus (Fig. 51.15). During a restoration after the ransacking of the sanctuary by the troops of Dionysius, The main facade was then decorated with an

episode of the myth of Ino. Finally, the temple seems also to have been dedicated to Astarte-Leucothea; an inscription with the name of Thesan, the Etruscan Dawn, and another, carved on a black-glazed piece of broken glass from the first half of the fourth century at the earliest, were found in near the building.

The reference to Greece is so overwhelming that, when the looting of Pyrgi by Dionysius of Syracuse is mentioned, Leucothea or Eileithyia is presented by Greek sources as the deity who is worshipped on the spot. Now the name of Leucothea transmitted by Siceliot or Athenian sources used by pseudo-Aristotle ([Oec.] 2.1349b) is that of a marine goddess charged with the education of young people, who is looked upon in Phoenicia as an *interpretatio Graeca* of Astarte, with marine and maternal aspects. For Raymond Bloch, two levels of assimilation should be distinguished. The first makes Uni, identified with Astarte in the bilingual inscription, a Mater Matuta and a Juno Lucina; the second makes these two Roman divinities Leucothea and Eileithyia.²⁸⁶⁵ In the case of Leucothea, this assimilation is all the more likely because, according to Ovid (*Fast.* 6.545–47), Hercules met Ino at the mouth of the Tiber in her Greek name of Leucothea. However, there are doubts as to the existence of a Roman mediation at a time when Phoenician-Punic people and Greeks had direct relations in the northern area of the sanctuary.

2Forms of Hellenization

As seen from the examples of Gravisca and Pyrgi, there are many ways to trace contacts with the Greeks in the Etruscan religion: the arrival of new gods, the practice of blood and bloodless sacrifices, votive offerings, and the architecture of temples and shrines.

2.1The arrival of new gods

The most striking form of Hellenization is the formation of an Etruscan pantheon that has numerous connections with the Greek pantheon. Etruscan gods have a vague, unclear, incomplete and seemingly contradictory character. They do not seem to have a history, at least as the readers of Greek myths understood the word. They have multiple, sometimes antinomic functions, accumulated by the making of offerings and their successive strata. The gods are endowed with individuality and a personality to look like men. Zeus, the Greek supreme deity with Uranian and paternal character, became Tinia; Hera, Uni; Athena, goddess of fate and oracles, Menerva; Ares, Maris; Poseidon, Nethuns; Hermes, Turms; Hephaistos, Sethlans; Dionysos, Fufluns;

Helios, Usil; Eos, Thesan; Aphrodite, Turan; and Demeter. Vei. Some Greek gods are even mentioned “just as they are called,” with their name barely changed, in the Etruscan pantheon. Apollo became Ap(u)lu; Artemis, Aritimi/Artume; Latona, Letun; Castor, Castur; Pollux, Pultuce; Heracles, Hercle; Hades, Aita; Persephone, Phersipnai; and Charon, Charun.²⁸⁶⁶ The resemblances are at once onomastic and iconographic.

It would be a mistake, however, to consider the Etruscan pantheon a simple peripheral copy of the Greek. Etruscan deities such as Culsans and Catha have no Greek equivalent. Although Hercle possesses the characters of the Greek Heracles, he is a god and not a hero, and has his own myths which are unknown in the Greek world. He abducted a woman named Mlachuch; he is represented as a child sitting on a raft of amphorae; he introduced his son Epiur to Tinia and became the adopted son of Uni. Maris, whose name suggests comparison with Mars, does not have the character of the god of agriculture or war, and is never represented as Mars. In addition, a number of deities are grouped in colleges or circles while having different names but performing the same functions.²⁸⁶⁷ Thus, the Roman *Dii Consentes* may have an Etruscan origin. It is no longer possible to think in terms of an “ordinary presence” of Greek themes in Etruscan myths and iconography, as we used to a few years ago, as if the Etruscans took on religious patterns without understanding them.

Etruscan artists and craftsmen knew the Greek mythical variations of the West very well. They selected the topics that interested them, and integrated them into the repertoire of Etruscan images, giving them a specific, political, symbolic, religious or eschatological meaning in accordance with their beliefs, their needs and the situation.²⁸⁶⁸

2.2 Blood and bloodless sacrifices

With the Hellenization of the pantheon, we can observe the regular practice of religious sacrifices in ways that partly resemble those used in Greece. Before becoming an Etruscan peculiarity that would have given its name to the Etruscans (Lat. *Tusci*; Isid. *Etym.* 9.2.86), sacrifices seem to have borrowed their forms from abroad. Our knowledge of the stages in this transformation is poor, but it is reasonable to think that the first forms of sacrifices on Etruscan territory are attested in Tarquinia under Cypro-Phoenician influence in the eighth century, and that they developed under the influence of the East or colonial Greeks. Indeed, we can observe a change in practices—for example, the adoption of bloody sacrifices, the use of knives and axes, and the adoption of bloodless sacrifices with bowls, *oinochoai*, *paterae*, cups, small cups, *thymiateria* and tripods. The parallel with Greek practice is troubling. Since Etruscan deities have the same attributes as their Greek counterparts, at least in some cases well documented by paleozoological and paleobotanical

analysis, they receive the same kind of sacrifices as in the Greek world. Pigs are sacrificed to Uni and Veī; dogs are sacrificed to Turan.²⁸⁶⁹

As in the Greek world, sacrifices were performed not only in a private environment, but also in larger groups and in public places, where, from the end of the fifth century, local issues played a prominent role. Private sacrifices were performed in houses, like in Accesa (Massa Marittima), where a three-room house dating from the first half of the fifth century, contained an *impasto* olla, full of thirty miniature *impasto* and bucchero *kyathoi*, which was placed against a wall of the smallest room. The ceremonies were extended to the clan or to the *gens* in the case of a funeral.²⁸⁷⁰ The body of the deceased was perfumed with ointments and viewed in a room of the house prepared for the occasion, where family members gave way to expansive demonstrations of grief.

The exposition of the body, called *prothesis* in Greek is represented on a relief from Chiusi dating to the early fifth century. The body is depicted on a ceremonial bed placed under a tent, on several mattresses and partly covered with a heavy cloth. Men at the foot of the bed lift their hands to their brows as a sign of mourning. A child is lifted to the height of the deceased's face, and an *aulos* player stands on a stool.²⁸⁷¹ Women wear their hair loose, their hands lifted to their faces or beating their breasts. The body is moved from the bed and honored with banquets and funeral games that were organized, it seems, on the Homeric model, sometimes on steps near the tomb, as in Grotta Porcina (Vetralla) and in the tomb of Cuccumella in Vulci (both first half of the sixth century).

In Vulci, the Cuccumella tomb was preceded by a 9 m wide open-air space, equipped with tiers on three sides, on which the persons taking part in the funerary ceremonies sat. In Grotta Porcina, we find a theatre, which is a place of worship. It is approximately 12 m wide by 15 m long, with tiers on three sides; in its center it has a circular altar, 6.2 meter in diameter, adorned with animal figures in relief, with a slope giving access to it. As shown by the channel dug on the southwest side, animals were sacrificed in the presence of the people who took seats on the tiers to attend the ceremony. This "theatre" marked the heart of a cemetery area and must have accommodated large gatherings for funerary ceremonies. Temporary wooden structures designed to welcome spectators are reproduced on game scenes on the delle Bighe Tomb at Tarquinia (late sixth—early fifth century).²⁸⁷² This is a difference from the Orientalizing period, when the open-air spaces were only provided for the family of the deceased and above all, had to be the expression of a gentile cult.

The body of the deceased was then cremated or buried, and pieces of furniture were set down in the tomb. When the body of the deceased was cremated, the pyre was placed near the tomb, as shown by the presence of *ustrina* near pit burials. Ceremonies may also have taken place also to honor dead ancestors, as shown by some Orientalizing and Archaic tombs at Caere

that contain thrones for the ancestors. This is confirmed by the vocabulary of funerary inscriptions including words such as *apa*, *apas*, *apasi*, and *apires*, which may be compared with the Latin *parentes*, *Parentalia*, and *parentare*. Some necropolises house sanctuaries or structures shaped like shrines, intended for the cult of the dead or the ancestors and the cult of chthonic and infernal divinities. Thus the sanctuary of the cemetery of La Cannicella in Orvieto displays several houses of worship, altars, basins, fountains, a canal network, statue bases and numerous architectural terra-cotta ware.²⁸⁷³ Essentially, divinities of chthonic nature like *Vei*, *Thanr*, and *Faunus-Heracles* were worshipped and offered sacrifices (see chapter 18 Maras). The link between the mortal world and the divine world was established through sacrifices on a tufa bench, in which a well was dug and covered with a lid, above a grave. In Capua, the sanctuary of Fondo Patturelli, where altars and *aediculea* were also numerous, was also a necropolis sanctuary (see chapter 74 Bellelli).

2.3 Votive offerings

Like the Greeks, the Etruscans of the Archaic and Classical period strongly competed to offer the gods tokens of a vow or of gratitude in the form of sacrifices.²⁸⁷⁴ These demonstrations of piety displayed in shrines have many forms: actual size or miniature (and therefore symbolic) sacrifice plates, first fruits or shares of the harvest, tithing (*dekate*) in the form of a metal object, a statue or statuette representing the dedicator himself performing a sacrifice, the deity to whom the offering was made, or an episode of the etiological myth. In the late sixth century, the kings and tyrants who liked to compare their actions to those of the heroes showed their piety with imposing ex-votos, such as a terracotta group of statues of *Hercle* and *Menerva* dating to 510–500, set up in the sanctuary of Portonaccio at Veii, one of the most imposing sanctuaries of the Archaic period.

It was there, between 520 and 500, that a large temple dedicated to *Menerva* was erected in an enclosure where other cults are attested. It is as wide as it is long (18.50 m), and presents a *postica* part slightly larger than the *antica* part. It is divided into three *cellae*, and was decorated with terra-cotta plaques in bas relief meant to mask the wooden structure, a sculpted pediment, and big acroterial figures. The acroteria are laid out to cover the whole length of the temple. Some important finds were the head and the shoulders of a *Turms-Hermes*, a large size statue of Apollo, a Latona holding in her arms Apollo as a child who has just shot his arrows into Python the snake, and a Heracles capturing the hind of Ceryneia. All the statues evoke Apollo as a symbol of an order vanquishing disorder. The Portonaccio cult received numerous dedications to *Menerva* and there may have been other goddesses as well, such as *Aritimi/Artemis* and *Turan/Aphrodite*, according to

a bucchero vessel. Another offering, a bucchero box dedicated by Laris Velkaskas, was possibly intended to hold *sortes* for divination. Votives have been dedicated by famous historical figures. For example, the mercenaries of the late seventh and sixth centuries are represented by a bucchero chalice dedicated by Aulus Vibenna. The Tulumnes family, known for the fifth-century King Tolumnius, who precipitated conflicts with Rome, is also represented. The sanctuary may have housed a school for scribes because the inscriptions of the sanctuary are notable for a distinctive syllabic punctuation and neat lettering.²⁸⁷⁵

2.4The architecture of temples and shrines

The Hellenization of gestures goes hand in hand with a progressive monumentalization of the places of worship on a Greek model.²⁸⁷⁶ Sanctuaries were erected in an urban and suburban environment, near the cities.²⁸⁷⁷ The sanctuaries were now delimited by an enclosure (*temenos*) marking the limits of the territory dedicated to the gods. It was marked on the territory by a wall with one or more doors, as at Pyrgi, where entry was through a propylon door, or through boundary stones (*horoi*), as in Bolsena. They were now organized around one or more altars (*bomoi*) on which sacrifices were made and a *focolare* pit for chthonic rites.²⁸⁷⁸ The location and construction of Greek temples followed Greek canons. Temples with Greek appearance were erected. Initially they were simple wooden *naoi* consisting of a long single room that sometimes ended with an apse. This is the case of the Temple of Piazza d'Armi, with an 18 m long and a slightly more than 6 m wide cella, which opened to the outside on one of the short sides and whose roof structure was protected by terra-cotta slabs with embossed decoration. Subsequently, the major civic cults of Polias multiplied between the late sixth and early fifth centuries in southern Etruria.

Finally, Hellenization played a seminal role in the spread through Etruria of the Orphic and Pythagorean religious doctrines in the fifth century; images of the Etruscan Hades, as seen in the painted tombs of Tarquinia, have a marked Greek flavor. For the Etruscans, the journey into the bowels of the earth was plagued by demons and myriad dangers.

3Etruscan characters

Recent research values Etruscan originality, and show the selection and adaptation of Greek models. The differences between Greek models and Etruscan realities are not just formal; they can also be explained by the Etruscan conception of the relations between men and gods. The Etruscan

underworld is very different from the Greek Hades. The Etruscans worshipped a plural form of *Charun* with varying names (*Charun*, *Charun chunchulis*) and varying visual forms (sometimes with wings, sometimes without). *Charuns* are accompanied by minor infernal forces unknown in Greece, probably of local invention, such as *Lasa*, *Vanth* and *Tuchulcha*.

For the Etruscans, there is a mystical correspondence between *templa in caelo, in terris* and *sub terra*; that is, there is a coexistence of supernatural forces in the celestial spheres, on earth, and in the underworld. For example, Etruscan temples are supposed to represent on the ground and as a permanent structure the portion belonging to the gods of heavens, since, strictly speaking, an Etruscan temple is an *effatus ager*, a space free from divine powers, limited by its angles and enhanced by the podium.

Another difference could be the practice of human sacrifices in exceptional cases. Phocæan prisoners were killed at Caere in 535 (Hdt. 1.167); Theodotus of Lipari was slain during the Etruscan conquest (Callim. *Aet.* fr. 93 Pfeiffer), and the Romans were massacred in Tarquinia in 358 (Livy 7.15.10). These can be considered exceptional cases because at Caere, according to Herodotus, the murder of the Greeks was considered a religious crime because it caused a plague that the people of Caere had to expiate by organizing games in honor of the dead Greeks and by the construction of a sanctuary near site of the murder.

We should not overlook the Faliscan, Latin and Umbrian contributions to the formation of Etruscan cults and rituals. Of evident Latin extraction are the gods linked to man's reproductive power and to nature, and hence to the primordial landscape and the earliest notions of agricultural cycles: *Vetis/Veive-Vediovis*, Ana-Anna Perenna, *Satre-Saturnus*, *Uni-Juno*; of Faliscan origin are *Suris-Soranus*; of Umbrian influence, *Vesuna*.

Thus, some scholars underline the importance of Etruscan settlements in Po-area Etruria, where forms of Etruscan religious organization are thought to be visible.²⁸⁷⁹ In the sixth century, Etruscans from Perugia, Chiusi, Volterra, and so on migrated to northern Italy (Marzabotto, Felsina, Spina, Adria, Mantua) and founded cities where they performed rites that differed somewhat from those of the Greeks. If the orthogonal plan of the city resembles that of the cities of Magna Graecia, the general Etruscan conception of urban planning depends on religious principles. At the junction of the two largest streets, a stone marked with a cross facing the cardinal points of the compass was found. Above all, in a place of the acropolis overlooking the city, there are remains of walls that are thought to be an *auguraculum* and an altar with a *mundus*, a tripartite temple, another altar with a molded base and access stairs.

Hilary Becker

55Economy, 580–450 BCE

Abstract: This chapter reviews the evidence for the mainstays of the Etruscan economy during the Archaic and early Classical periods. In order to form a picture of the domestic economy, Etruscan agricultural production as well as the collection and processing of metal resources are considered. The economy of this period is also robust due to the system of cabotage along the Etruscan coast and the *emporia* that flourished at this time. Important evidence can be gleaned about the littoral trade by reviewing evidence from these *emporia*, as well as shipwrecks, epigraphic and iconographic sources, and the ubiquitous “Etruscan pirates.” Different methods of exchange, from bartering to the use of coinage, which first appears in this time, is also presented. While this period marks a highpoint for Etruscan international commerce, beginning in the early fifth century, the pattern of international trade changes significantly. This chapter assesses this changing commercial scene in southern coastal Etruria as well as in northern areas (i.e. Populonia and the Po Plain).

Keywords: Agriculture, coinage, economy, *emporia*

Introduction

Etruria is often thought of as a loose grouping of city-states that did not have a federal organization. The regional diversity can be identified thanks to the different months used in Etruscan calendars, or by the fact that some city-states may have two eponymous *zilath* (chief magistrates) while others have only one.²⁸⁸⁰ But even economic exchanges do not seem to be uniform across Etruria, as the standards of weights and coinage could both vary.²⁸⁸¹ The economic experience was not uniform across Etruria as the city-states enjoyed varied trade routes and local products. This diversity is perhaps best expressed in the seminal time of the Archaic and early Classical periods, when many Etruscan centers were at the height of their commercial power. When there was a sudden downturn in commercial contact along the Tyrrhenian shores at the end of the Archaic period, the economy of some Etruscan territories suffered deleterious effects, while other Etruscan centers continued unchanged or even experienced expansion; these transitions are explored in this chapter and elsewhere (see [chapter 61](#) Becker).

1Etruscan Resources

Products including cereals, wine, and livestock were undoubtedly the mainstays of the agricultural economy of Etruria. Due to the ephemeral nature of these products, it is impossible to make a quantitative analysis of productive capacity during the Archaic period. In Roman times, the fecundity of Etruscan soil was legendary. Diodorus Siculus (5.40.3–5) wrote that the soil of Etruria was moist in both winter and summer and capable of bearing every crop. Varro (*Rust.* 1.44.1) believed that seeds planted in Etruscan soil (*Tusci campi*) would produce substantially more in volume compared with other regions.²⁸⁸² Certainly there would have been variation in the agricultural economies across Etruria, and that much is clear from the different contributions given by the Etruscan city-states in 205 BCE to support the fleet of Scipio (Livy 28.45.13–18). This is also clear in coastal Southern Etruria, where both Caere and Vulci produced enough surplus wine in the sixth century that the transport *amphorae* from each have been found abroad. For example, the archaic shipwreck at Antibes had *amphorae* from Caere, whereas the shipwreck at Bon-Porté had wine *amphorae* from Vulci.²⁸⁸³ In contrast, Tarquinia did not produce significant amounts of wine.

The farmhouse excavated at Podere Tartuchino (near Saturnia) provides an opportunity to understand what agricultural life was like during the Archaic period and beyond (Fig. 55.1). This farm had two phases stretching from the late sixth to the late fourth century. The house had a portico and a courtyard, which could have been used for both farming and domestic activities.²⁸⁸⁴ The farm once had mixed crops, including spelt. Such a varied strategy would have given variety to the inhabitants' diet and protected them against the potential of blight destroying a single crop.

The remains of a large *pithos* with a protective interior coating of resin, as well as hundreds of carbonized grape seeds, indicate that wine may have been produced here, even if at a small scale. The *pithos*, which once held ca. 350 liters, can be helpful in determining the farm's potential productive capacity with respect to wine. It is possible that wine could be produced in multiple batches (as many as five to six fermentations) each season. If the *pithos* was used each time wine was fermented, as many as 1, 575–1,890 liters of wine could have been made each year—an amount that would far exceed the consumptive needs of the residents of the house (estimated at 4 adults). Even if the *pithos* was filled only once per annum, a surplus would probably still remain. In either case, any leftover wine could have been traded for whatever was not made locally (such as the nails, soapstone beads, or ceramics found at the site).

Fig. 55.1: Farm house at PodereTartuchino, reconstruction of the Phase II building, (after Perkins and Attolini 1992, fig. 22)

Another settlement that provides a window into life and economy is at Lago dell’Accesa, a mining settlement of the Archaic period near modern Massa Marittima. The site was ideally situated close to mines, a lake, and a river. The proximity of the residences to the mining area has prompted excavators to suggest that the directors of the mines lived there.²⁸⁸⁵ The proceeds from the mining activities (and perhaps other ventures) allowed the residents to have imports from outside the local area in their homes and tombs, including amber, Etrusco-Corinthian pottery, Attic vessels, in addition to local materials.²⁸⁸⁶ Residents were also able to extract many of the resources they needed from the surrounding area, as exemplified by a fishing weight which was found in one house and also by spears for hunting, which were found in many tomb assemblages. Inside complex X, 20 loom weights have been discovered, providing evidence for the domestic production of textiles at the site.²⁸⁸⁷ It is also thought that the wooded area now surrounding the site may have been cut back in antiquity, providing wood fuel for metal-working. A bronze device that may have been a pruning tool for vines was also found near the river.²⁸⁸⁸ While the residents of these houses were participating in an industry that would potentially send their refined metals far afield, it is interesting to note that while their trade enabled them to import goods, like their peers at Podere Tartuchino, they were able to produce at least some of their daily needs locally.

A glance at a map of Etruria reveals that during the Archaic period many minor settlements existed, in addition to the chief cities, which would have helped to absorb some of the surplus agricultural products of the surrounding farms from their catchment area and potentially to serve as places of exchange. In the last decades of the sixth century, for example, the areas around Castro (Vulci) and the valley of the Mignone (Caere) both saw an increase in the number of minor settlements, allowing for much more intense agricultural production.²⁸⁸⁹ These minor settlements may be connected to members of the aristocracy who acquired rural land during this time and who had connections to the major centers. The presence of aristocrats in some areas has been indicated by the construction of funerary monuments, such as the chamber tomb built near the small hilltop settlement at Poggio la Croce (Fiesole).²⁸⁹⁰

In addition to the agricultural fecundity of Etruria, significant mineral resources were also present. Paul Craddock notes that “virtually all the metals of antiquity with the exception of gold are represented” in Etruria.²⁸⁹¹ The distribution of these mines was laid out in such a way that many important centers were close to mines (see [chapter 25](#) Zifferero). Caere and Tarquinia were near Monti della Tolfa, Vetulonia near the Colline Metallifere, Populonia near the Campigliese and Volterra was near to mines in the Val di Cecina. Populonia in particular had long been an important center of processing and redistribution for the metal-rich areas of inland Etruria, but its economic orbit expanded in the Archaic period. For it was in the second half of the sixth century that the iron from the nearby metal-rich island of Elba began to be imported into the Porto Baratti in raw form so that it could be processed at Populonia. Strabo (5.2.6) explains that the reason for this change was that on-site furnaces at Elba could not process the ore sufficiently.²⁸⁹² At the same time, an industrial quarter was built outside Populonia’s walls at Poggio della Porcareccia, which had different areas for habitation and production.²⁸⁹³ The regularized placement of the industrial quarter and adjacent habitations inside the urban plan suggests the city’s involvement in this area.²⁸⁹⁴ A natural question then relates to who or what controlled the industry at Populonia. Did the wealthy elite or the state direct this production, did they work in harmony, or were these two groups, at this early period, indistinguishable? Certainly, a synergy between these two groups might have been important to protect these resources from foreign powers (e.g. raiding Syracusans) in the centuries that followed (Diod. Sic. 11.88.4–5; 15.14.3).

Populonia was not the only site where Elban ore was processed, as a series of small- and medium-sized refineries existed in the hinterland of Populonia and Vetulonia.²⁸⁹⁵ Follonica (località Rondelli) was one of those sites, and, like the area of Poggio della Porcareccia at Populonia, there was both an industrial area for processing iron, and a habitation area adjacent to it.²⁸⁹⁶ One thousand kg of slag were found there, as well as twenty-one furnaces (although the excavators believe that there could have been even more

furnaces). In addition, a lead and bronze weight (315.41 g) was found there that might have been used for weighing and trading the refined iron.²⁸⁹⁷ One of the advantages of this informal network of processing sites is that their fuel supply of charcoal would have been plentiful, as the coastline was wooded. A large quantity of charcoal is needed to reach the high temperatures (ca. 1060°–1300° C) required for metal smelting and iron working.²⁸⁹⁸

After the metal had been smelted at Populonia, Follonica, and other sites, Diodorus Siculus explains (5.13.1), this refined product was exported by merchants “in exchange either for money or for goods” and brought to Dicaearchia (modern Pozzuoli) or other trading centers (*emporia*) and worked by artisans there.²⁸⁹⁹ And while Diodorus gives the impression that raw iron was transported elsewhere to be processed, we know that at least some of it was forged locally. For example, the habitation of Fonteblanda (near ancient Talamone), a site nearly 1 km from the coast, which was busy with the trade coming from inland areas toward the coast, had a blacksmith’s workshop that worked Elban iron (see [chapter 26](#) Corretti).²⁹⁰⁰

2Etruscan trade at the ports and foreign contacts

It is clear that Etruria had, at that time, agricultural products and raw and finished metal goods to trade, as well as a settled landscape composed of city-states that were strong enough to protect their economic interests from potential maritime raiders. The foreign contacts that first developed along the Etruscan littoral to handle the export of Etruria’s agricultural products and raw and finished metal goods in the Orientalizing period continued into the Archaic period. The southern cities of Caere, Tarquinia, and Vulci continued to export the majority in metals that originated from the Colline Metallifere, Elba, and elsewhere in Etruria. But these southern cities did not develop directly on the coastline, and while this circumstance protected them from piracy and afforded each city with natural defense and easy access to rivers, they were thus removed from direct trade. In the Orientalizing period, any traders would have had to travel to the cities themselves to trade for resources, but in the sixth century, trading *emporia* were developed along the coast by these cities and their elites. Such *emporia* would provide a trading port that could be used by merchants passing through or lingering, as well as by the native inhabitants. Each of these trading ports also had at least one sanctuary whose god(s) would serve to mediate the space so that all might feel more comfortable trading near this sanctified space, whether one worshipped, for example, the Etruscan goddess Uni or Punic Astarte.

Tarquinia’s *emporium* at Graviscae offered multiple sanctuaries, including one to Aphrodite. This sanctuary thrived from around 600 to 480, and Greek inscriptions demonstrate that visitors appeared to be from different areas of

East Greece (especially Samos, Ephesus, and Miletus) and beyond.²⁹⁰¹ These visitors sought the help of Aphrodite, who in other Mediterranean contexts is associated with aiding navigation, as well as other Olympian gods.²⁹⁰² But interestingly, a sixth-century Etruscan inscription was dedicated to Turan, the nearest Etruscan equivalent to Aphrodite, thus indicating the international scope of this sanctuary at Graviscae. This sanctuary was prominent enough to attract a Greek named Sostratos, who dedicated a stone anchor and who may well have been the very successful merchant who made a large profit in cargo abroad and came to be immortalized by Herodotus (4.152). This same Sostratos may have also been an important importer of Attic vases to Etruria in the late sixth century.²⁹⁰³

The sanctuaries associated with the *emporia* certainly had an active economic life. Just to give an indication of this, Rome's early treaty with Carthage prohibited Rome from trading or buying things past the Fair Promontory of Carthage, but an exception was made for vital needs, such as repairing one's ship or for sacrifices (Polyb. 3.22.5). Making dedications to the gods is something that sailors did, and such sacred commerce at the *emporia* would have provided a comfortable intercultural scene for people of different languages and cultures to connect to trade products, customs, and ideas.

The unusual fresco of the Tomb of the Ship (mid fifth century BCE) from Tarquinia helps us visualize the key stages of exchange that transpired in Etruscan *emporia*, serving as visual documentation of a key socioeconomic phenomenon that no doubt transpired at many commercial sites along the Tyrrhenian seaboard (Fig. 51.8). The fresco scene depicts a merchant ship pulling in its sails and nearing the port while being saluted by a richly dressed man on shore. Near this individual is a *kylikeia*, a stand full of different types of Attic vases.²⁹⁰⁴ Even though the intrinsic value of vases continues to be debated, it is clear that to the family that owned this tomb, these products carried important socio-economic valence.²⁹⁰⁵ One intriguing and unanswerable question is what the arriving ship might have carried in its hold. Was the vessel bringing more Attic vases to Tarquinia, such as those depicted in the fresco, and/or other imported products? In return, would this ship have picked up items such as metal ingots or grain?

The banquet, which the Attic vases helped to facilitate, served to underscore the prominent social status of the tomb occupant and/or his family. Each banquet would have displayed the wealth (and some of the products of trade) that was made possible by the tomb owner's own involvement in trade. It is also possible to speculate about the relationship between the merchants and the individual waiting at the shore. It is very likely that foreign merchants had connections with particular elite citizens in each city, which may have involved hospitality, the sharing of lodging, or gift exchange. It is because of such social institutions that Demaratus of Corinth might have known that he would be well-received by fellow aristocrats in Tarquinia, and such social

connections would have facilitated the movements of Etruscans into other regions.²⁹⁰⁶ It may be that the merchants sailing into Tarquinia on the fresco of the Tomb of the Ship are about to be hosted at the very banquet depicted in that scene. With practices like hospitality, it may be possible that the Tarquinian depicted on this fresco may not ever have had to travel beyond Etruria to nurture trade relationships with foreign partners.

3Etruscan trade abroad

These Etruscan ports and *emporia* were engaged in a trade that not only came to their shores for raw materials, but that continued along a coastal route to southern France and beyond. Small ships would make stops at the different *emporia* of Etruria, picking up and dropping off goods (the practice of cabotage). This scenario is revealed by the sixth-century transport *amphorae* found at Graviscae.²⁹⁰⁷ As mentioned in [section 1](#), Tarquinia was not significantly engaged in wine export, but her neighbors were. Since the port-to-port trade traveled northward, it is not surprising to find that a significant number of the *amphorae* found there were made at Caere and not Vulci, not counting all the imported wares found there.²⁹⁰⁸ Thus Graviscae is not a port only for the goods of Tarquinia, but a “relay” point for coastal exchange.

This exchange route is in fact marked by contemporary shipwrecks that bore not only Etruscan goods, but also other products from around the Mediterranean, which are representative of this port-to-port trade. For example, a shipwreck (600–590) near the island of Giglio contained items that can be traced to Etruscan, East Greek, Corinthian, and Punic sources. Other shipwrecks, those from Bon Porté (540 and 510) and that from Cap d’Antibes (560–550), and the Grand Ribaud F wreck (500–475), also had similarly mixed cargos.²⁹⁰⁹ The evidence from the Giglio shipwreck confirms our understanding, which is that vessels, probably of small size, stopped at many ports along the Tyrrhenian coast, visiting ports of call in Campania, Latium, Etruria, and beyond, all the time acquiring new cargo and dropping off items.²⁹¹⁰

Etruscan ports and *emporia* were clearly not passive hosts and traders but were engaged in this long-distance trade. In Greek, the word “Tyrrhenian” was often synonymous with “pirate” because of the Etruscans’ prowess at sea.²⁹¹¹ Their power was so strong into the fifth century that Dionysius of Halicarnassus (*Ant. Rom.* 1.11) named them *thalassokratores*, “masters of the sea.” Cato even believed that, at that time, almost all of Italy was under their control.²⁹¹² It could be that in some cases, when the Etruscans acted in defense of the control of preferred trading routes (e.g. Battle of Alalia) or the metal ores, this behavior could be construed as piracy.

The Carthaginians, the most famous seafaring traders of the Mediterranean

world in their time, evidently had a symbiotic relationship with the Etruscans. We know this because of a treaty that existed between the Carthaginians and the Etruscans (Arist. *Pol.* 3.5.10–11). Aristotle mentions that this treaty involved Etruscans, but since each city-state was independent, it is likely that each of the coastal city-states active in maritime trade (i.e. namely Caere and Vulci) would have had its own treaty with Carthage.²⁹¹³ Polybius (3.22.4–13) mentions an early treaty (509) between Rome and Carthage that had specific provisions about where Romans could trade. It is possible that the diplomatic and contractual agreements between city-states in Etruria and Carthage also addressed “spheres of trade.” Archaeological evidence may support this idea of a commercial agreement, as Etruscan goods are not found west of Cadiz in Spain.

The Caeretans famously attempted to flex their naval power when they united forces with the Carthaginians against Alalia (Aleria) at Corsica in 540. For it seems that new colonists in Alalia (e.g. Phocaeans) had been encroaching on the trade routes of the Etruscans and Carthaginians, and thus in the context of this naval battle the colonists were viewed as the pirates (Hdt. 1.167). This battle resulted in the abandonment of Alalia by the Phocaeans.²⁹¹⁴ The Carthaginians also took advantage of the religious aspects of the *emporion*, such that the dedicatory hammered gold plaques (ca. 500) at Pyrgi had text written in both Etruscan and Punic. These plaques show how a goddess (Uni or Astarte, literally *Unialastres*, i.e. “Uni-Astarte” in the Etruscan version) helped the local tyrant Thefarie Velianas of Caere (Fig. 35.2).

The Etruscan presence in the western Mediterranean is attested by the presence of inscriptions at sites such as Saint-Blaise, Lattes, Collège Vieux-Port de Marseille, and even Ampurias.²⁹¹⁵ Etruscan participation in trade was made more real by the discovery of the Pech Maho plaque (near Narbonne). This is a contract from the first half of the fifth century written in Etruscan that mentions *kisne*, the Etruscan word for “down payment”, and Massalia (Matalia, possibly an origin or destination). Etruscan individuals (a *Venel* and an *Utavu*) are mentioned on the Etruscan text.²⁹¹⁶ This inscription was written on the reverse side of a similar commercial contract in Greek, this time discussing the purchase of goods from Emporitans. Were contracts standard for Etruscans like Venel who traded in the Mediterranean? And for Venel’s counterparts in mainland Etruria, were contracts used at the Etruscan *emporion* or for commerce further inland? To date, the only other recognizable Etruscan contracts deal with private land and date to the Hellenistic period (the Cortona tablet and the Perugia cippus: see chapter 67 Becker).

4Methods of exchange

Coinage, which began to be used in the Archaic period, was never the predominant means of exchange in Etruria, so much so that it is not clear that all Etruscan cities even minted coins (see [chapter 27](#) Catalli). Bartering, then, would have been a primary means for Etruscans to acquire what they did not produce themselves. One of the simplest transactions would be the exchange of surplus goods among neighbors, either at the home or at a property boundary, transactions categorized by Colin Renfrew as “home base reciprocity” and “boundary reciprocity” respectively.²⁹¹⁷ But sometimes a simple exchange would not have sufficed, for instance if a consumer wanted to buy sandals and only had spelt, but the sandal maker did not need any spelt. More complex bartering could then be employed for “down-the-line trade,” trading product A for B, B for C, and so on. Such an activity could result in a product traveling a considerable distance.

Metal offered an attractive alternative to an agricultural society because it provided a means to store surplus over a much longer time, whereas surplus spelt, for example, only had a limited duration. Two pre-monetary forms of exchange existed before the introduction of standardized coinage, *aes rude* and *aes signatum*; neither of these was currency per se, but the quality and quantity of the metal would have been a factor in their exchange.²⁹¹⁸ *Aes rude* was found primarily in the form of rough lumps but also was fused into bars or plates. A small piece of *aes rude* from the plow soil of the farm at Podere Tartuchino may indicate an instance of surplus exchange.²⁹¹⁹ Excavations at Bagnolo San Vito, in the Po Valley, have uncovered 343 pieces of *aes rude*.²⁹²⁰ What is interesting about this sample is that there is a sufficient quantity available to study and compare, and with that in mind, no clear weight systems have emerged. Instead, it can be imagined that when these pieces were traded, they would have been weighed individually in order to determine their intrinsic value.

Aes rude is often found in context together with *aes signatum*, and they could clearly be used interchangeably. The advantage of *aes signatum* is that it is a bar of bronze, characterized by a countersign on its face that guarantees the quality and weight of the metal by a particular authority. Servius Tullius is credited with introducing *aes signatum* to Rome.²⁹²¹

When the Etruscans began to mint their own coinage toward the end of the sixth and the early fifth centuries, eastern Greek (Phocaeen) coins provided models for the coin typologies as well as the weight standard, although different standards prevailed later.²⁹²² The earliest datable coins found so far in Etruria are from the late sixth or early fifth century.²⁹²³ These coins (thirty-nine in all) were silver and were found near the walls of Volterra together with Phocaeen and Massaliot coins. These coins feature either a pegasus or the head of a gorgon and are not marked by an inscription. Marina Martelli believes that the iconography indicates that the coin was minted by Populonia, since Populonia later came to use the head of a gorgon on some of its civic coinage.²⁹²⁴

Etruscan coins were first produced in small quantities and had a high face value— “small change” would come later (see [chapter 27](#) Catalli).²⁹²⁵ Fiorenzo Catalli observes that the earliest coins had a limited area of circulation and were probably not produced on the authority of any Etruscan city but rather “were produced to circulate within particular patrician groups for the payment and acquisition of services and goods.”²⁹²⁶ Another limited series dates roughly to the first half of the fifth century from Vulci and bears the legend *Thezi* or *Thezle* and is thought to have been made in the area of Vulci, a city whose *emporium* also made it a commercial hotspot of sorts for international trade.²⁹²⁷ The *Thezi/Thezle* coins were produced in small quantities and are thought to refer to the name of the family that authorized the coins.²⁹²⁸ A logical question centers around what provided the impetus for these initial limited emissions. Whether these coins were needed by a gentilician group or the state, they would have provided a means for outlaying a large sum, such as for buying armor or hiring mercenaries, in a short period of time. Securely dated coinage minted by Etruscan city-states does not pre-date the middle of the fifth century.

5The crisis and southern Etruria

A pivotal event in Etruscan history was the defeat of the Etruscan fleet at Cumae in 474 by Hieron of Syracuse. This battle, coupled with the waning presence of Etruscan influence in Rome and (eventually) Campania, signaled the end of Etruscan thalassocracy. This “crisis” absolutely changed the economic role of the coastal south Etruscan centers at the end of the Archaic period. The sanctuary of Graviscae, once populated by Greeks and Etruscans, was now frequented only by local, Etruscan traffic, which sought the benefits of Turan. The importation of Attic pottery into the ports of southern Etruria was curtailed dramatically by 460–450.²⁹²⁹ By around 450, the tombs at Tarquinia, Caere, and even Orvieto had diminished and the funerary assemblages were less lavish.²⁹³⁰

6The crisis and how the north adapted

6.1Populonia

With the sudden decline in trade experienced by the southern Etruscan ports, Populonia began to absorb some of the slack. Populonia’s apparent control over the Elban mines reinforced the site’s centrality, as discussed in [section 1](#), as a place to obtain important raw materials. The importation of Attic vases to

Populonia increased from 450–350.²⁹³¹

6.2The Po Plain

The Po Plain was transformed in the middle of the sixth century as Etruscans sought out both new commercial opportunities and access to the Adriatic Sea in place of the Tyrrhenian Sea (Liv. 5.33.9–10). The long-active city of Felsina (modern Bologna) was reorganized and became the leading city of the reinvigorated and expanding Po Plain (Pliny *HN* 3.15.115–16). Sites were founded or refounded, such as Marzabotto, which lay on a key communication route in the Apennines near Bologna that led to Tyrrhenian Etruria, Spina (on the Adriatic coast), and Mantua, which connected to routes coming from Transalpine Europe.²⁹³² Some of these important demographic shifts can be attributed to new inhabitants from northern Etruria, but the majority of evidence from nomenclature indicates that the majority of residents of this new order were originally from the Po Plain.²⁹³³

6.2.1Marzabotto

Marzabotto, founded on an orthogonal plan by the end of the sixth century, was a vital commercial and industrial city. City blocks contained both domestic quarters and workshops for tile making, bronze foundries, and iron smithies.²⁹³⁴ One of the most striking discoveries that testifies to the orbit of this city's commerce are the stone weights that have been found there.²⁹³⁵ While it is often said that it is hard for us today to make a quantitative estimate of the Etruscan economy, it can be said that in antiquity quantity was very important. At Marzabotto, more than sixty stone weights have been discovered. What is interesting about these weights is that they are not all based on the same ponderal system. The system can be reconstructed in each case thanks to the many stone weights that have numbers. For example, each of two stone weights has one tick mark inscribed on it, indicating that its weight is one times the ponderal base (in this case the ponderal base of each is 114–115 g).²⁹³⁶ Another weight has three tick marks and weighs 1,135 g, while yet another has five tick marks and weighs 1,905 g. A quick calculation reveals that these latter weights are both based on a standard that is roughly 380 g; clearly this standard is different from that shared by the first two weights discussed.²⁹³⁷ A weight of roughly 380 g is the most common standard found at the site; it was also found among the Picenes and the Vestini.²⁹³⁸

Another weight shows the coexistence of these different systems well, as one face of the weight bears the Etruscan numeral “X,” or ten, while the other side has three tick marks crossed by a fourth, and so, as Maggiani reads it, it represents four.²⁹³⁹ This weight weighs 1,432 g; thus if the weight is signaling

on one side that it represents 10 times a certain base weight (or pound), this weight standard is 143.2 g (i.e. yet another standard of measure!). Whereas, on the other side, dividing the known weight of the stone by four gives a ponderal standard of 358 g. Both these standards are clearly different from those of the weights described above.

It is evident that different weight standards were in use at Marzabotto, and the reasons for this could be manifold. It could be that different industries used different weight standards (e.g., agricultural produce, metallurgy, or regional coins set on different weight standards?). Or it could be that certain standards prevailed in certain places or at certain times. Above all, especially in an economy that was never fully monetized, weights allowed consumers to make regulated exchanges using the weight of bronze, in particular, as a standard.²⁹⁴⁰ Finally, a loanword that the Romans borrowed from the Etruscans may give some indication of the Etruscans' use of weights, namely, *mantis(s)a*, meaning "makeweight," although we do not know precisely how the Etruscans used this word.²⁹⁴¹

6.2.2Spina

Spina, founded along the Adriatic coast after the middle of the sixth century, was ideally situated to participate in Adriatic trade with Athens and continental Europe, but its own land was marginal and marshy. The land was reclaimed by means of a series of canals gridded within the orthogonal street plan, and houses were built on wooden piles.²⁹⁴² These modifications allowed this less than optimal land to be usable, allowing Spina to participate in the bustling trade. This massive endeavor speaks to well organized planning in terms of the organization of local labor.²⁹⁴³

Spina, like Caere before it, was a major port for maritime traffic, and like Caere, even had its own treasury at Delphi, perhaps by the first half of the fifth century.²⁹⁴⁴ Interestingly, of the approximately 1,700 Attic vases that Beazley counted in the Po Valley, nearly 1,400 of them come from Spina, indicating that not a lot of the wares (ca. 20%) were traded beyond the port.²⁹⁴⁵ Goods exported from Spina no doubt included grain from the Po Valley, animal products, amber and tin from the north, and perhaps metals from Etruria proper.²⁹⁴⁶

56External relationships, 580–450 BCE

Abstract: This chapter deals with the importation of Attic pottery, which set in with transport amphorae of the SOS type shortly before the middle of the seventh century BCE, and which are found exclusively in particularly rich burials such as the Regolini-Galassi tomb in Caere. Around 600, the pottery imported from Athens gradually rose in both quantity and quality (fine wares appeared for the first time), and from the second quarter of the sixth century onward it dominated the entire Italian—and specifically the Etruscan—market. Since the beginnings of the importation of Attic vases were recently studied, this need not be discussed here. This chapter looks more closely at certain aspects of the peak period of Attic importation, which lasted from the middle of the sixth century to the early fourth century. In addition, for selected aspects the chapter examines the situation in Greece itself.

Keywords: Athens, Attic pottery, Etruscan market, Bologna, Kamiros Macri Langoni

Introduction

This chapter deals with the importation of Attic pottery, which set in with transport amphorae with typical SOS decoration on the neck shortly before the middle of the seventh century BCE, which are found exclusively in particularly rich burials such as the Regolini-Galassi tomb in Caere.²⁹⁴⁷ Around 600, the pottery imported from Athens gradually rose both in quantity and quality (fine wares appeared for the first time), and from the second quarter of the sixth century onward it dominated the entire Italian—and specifically the Etruscan—market. Since the beginnings of the importation of Attic vases have recently been studied, this need not be discussed here.²⁹⁴⁸ The chapter looks more closely at certain aspects of the peak period of Attic importation, which lasted from the middle of the sixth to the early fourth century. In addition, for selected aspects the chapter examines the situation in Greece itself.

1Etruscan customers

A few years ago I undertook a critical reconsideration of this topic and developed a new model of interpretation, putting forward several theses.²⁹⁴⁹

Since a large quantity of Attic vases had been found in funeral contexts, it was commonly held that such pottery must have had a specifically funerary

dimension, that these vases were intended for tombs in the first place, and that Etruscan customers bought them for this purpose. This is unlikely to have been the case, however, because Attic vessels of the same shape and imagery were present in Etruria in greater numbers in both private dwellings and public sanctuaries. Significantly, Attic vases were distributed in large numbers throughout Etruria and are found in coastal and inland areas. There is evidence to suggest that in the main sites the quality of the imports was higher than in the smaller cities and the villages in the hinterlands.

Figural pottery clearly dominates the archaeological record. In addition, most Etruscan settlements, sanctuaries, and necropolises yield Attic black-gloss ware, albeit in considerably smaller quantities.²⁹⁵⁰ These types of pottery complement each other in terms of shape, with smaller shapes dominating in black-gloss. It is also worth pointing out that the question of individual painters or potters—which has so concerned many a Classical archaeologist—does not seem to have played any significant role for Etruscan customers.

Much Attic pottery has been found in Etruscan sanctuaries.²⁹⁵¹ This is true not only for the large sanctuaries of the main sites in southern Etruria but also for sanctuaries of smaller settlements, for humble sacral precincts outside the cities, and for remote shrines in rural areas. Attic pottery must therefore have commonly belonged to the inventory of Etruscan sanctuaries from the sixth to the early fourth century.

These Attic vases may well have fulfilled several functions in Etruscan sanctuaries, as was the case in Greece.²⁹⁵² They either belonged to the actual cultic apparatus and served as dishes on the occasion of sacred meals (which are well known from Greek contexts and which, it seems, are to be assumed for Etruria as well); or they were brought to the sanctuaries as votive offerings, as is suggested by the dedicatory inscriptions which are occasionally found.²⁹⁵³ From the shapes of these vases it can tentatively be inferred that Attic imported pottery was primarily used for drinking, and potentially used for libations in sacred rituals. In the cases where only a single or very few Attic vessels are known in an Etruscan sanctuary, these objects are, with few exceptions, cups.

Athenian vessels belonged to the usual inventory of simple as well as more complex Etruscan houses.²⁹⁵⁴ Again, this is true not only for larger cities but also for smaller villages and even individual estates, in coastal as well as inland areas.

The frequency of cups, *skyphoi*, and, to a lesser degree, kraters in the context of most Etruscan settlements underlines the fact that, as concerns private houses, the importation from Attica is to be seen in connection with banquets and symposia. Whether these vessels were used in daily life or whether they served festive and representative purposes is, however, a question that remains unanswered.

In the sixth and fifth centuries, Attic vases were commonly used as funeral

offerings in the bigger cities as well as in the smaller centers and villages.²⁹⁵⁵ It is therefore erroneous to regard these vases as luxury items, because Attic pottery was used not only by the elite but also by people from a wider social spectrum, in both urban and rural areas. Men, women and children received Attic vessels as burial offerings, which were of equal quality; no distinctions seem to have been made in terms of shape or imagery. A detailed study of child burials in Spina has shown, however, that at least in the case of children, there was likely a more complex situation.²⁹⁵⁶ Unfortunately, similar studies for other Etruscan necropolises are lacking.

A survey of a larger number of funeral contexts shows that in many cases a conscious choice of form and—at least partly—imagery can be demonstrated. It must therefore be assumed that Etruscan customers did not buy Attic vessels at random but made conscious selections. Most of the black-figure and red-figure imagery on imported vases possessed certain meanings for the Etruscans, who had a rich world of mythological images. Even though this imagery was closely connected to its Greek counterpart, it was Etruscan. Moreover, these were meanings that Etruscan viewers could “read” and interpret.

For the Etruscan customer, the shape of the pottery imported from Athens was of central importance.²⁹⁵⁷ Most Attic shapes were popular in Etruria, too, and met with a ready market. Conversely, individual Athenian workshops are known to have copied certain Etruscan shapes and to have produced them almost exclusively for an Etruscan market, in particular for Caere or Vulci.²⁹⁵⁸ This seems to be the story told by the manifold examples of Nikosthenic *Bandhenkel* amphorae, *kyathoi*, mastoid cups, stands with half-cylinders, and *stamnoi* which Etruscan sites yield regularly. The potters in the Athenian *Kerameikos* must have been well aware of the possibilities of a flourishing Etruscan market.

For the most part, the shapes of Attic pottery in Etruscan tombs, like those in houses, can be seen in a clearly functional context. Storage jars for wine and water, vessels for libations and for drinking, and oil flasks form comprehensive table services for drinking and libations. Such sets were part of a “symposium culture”, which in Etruscan society must have played an important role in daily life, cult activities, and funerary rites.

Several years ago, Karim Arafat and Catherine Morgan presented a stimulating paper discussing some general aspects of the significance of Attic pottery in Etruria (and some Celtic territories).²⁹⁵⁹ They were correct to postulate that certain types of material gain new and different meanings in the transition from the primary culture to a secondary cultural context and that it is of particular importance to examine their new meaning in the recipient society. The following analysis adds a further dimension by suggesting that comparison with the situation of the producing culture, too, can yield useful results and is in fact indispensable because it leads to new insights into the nature and significance of the cultural contacts between two societies. As the

two authors emphasize, Attic pottery was mainly a possession in private hands and was produced primarily for the home market. It did not rank among the most important commercial articles of merchant ships, and traders and middlemen from various regions of Greece and probably Etruria itself were involved.²⁹⁶⁰ Nonetheless, there are many hints to suggest that Athenian producers were well aware of the preferences and needs of their Etruscan customers and that they took into consideration the exigencies of the Italian market; this becomes obvious above all in the adoption of several Etruscan shapes into the Athenian repertoire. It is safe to assume that export activity from Attica was not connected to any Athenian interests, military or political, in Etruria. The sources provide no support whatsoever for making such an assumption.

The vase shapes and the particular preference for Dionysian themes and symposiast scenes further show the context in which this pottery is to be placed: the banquet and the symposium. This becomes obvious not only from the evidence provided by the artifacts found in tombs, but also from the finds from settlement areas and, at least in part, sanctuaries (where other factors such as particular connections to the deity were taken into account).²⁹⁶¹ For sacred contexts, a more detailed study is certainly required.²⁹⁶² In any case, in comparison with other Italic or even Greek sites, it would certainly be wrong, in the case of Etruria, to speak of a limited and one-sided selection of shapes of Attic pottery.

There are some shortcomings in Arafat and Morgan's analysis. The lack—or insufficient consideration—of less well-known sites, the specific contexts in Etruria, and all the regions to which the Etruscans had spread, led to a number of statements that more recent studies have seriously called into question.²⁹⁶³ Attic fine wares were disseminated even to remote regions and to small contexts of very different character—settlements and sanctuaries, not only tombs.²⁹⁶⁴ The evidence forbids us to speak of diffusion only to urban centers and trading posts in southern Etruria (Chiusi is considered exceptional).²⁹⁶⁵ Bologna and Spina were not Graeco-Etruscan *emporia* but Etruscan cities—and in the case of Spina, with some Greek inhabitants.

Analysis looking separately at the different geographical regions shows that with respect to types, shapes, and imagery, the situation can differ greatly according to time and place, and that such differences must consequently be taken into account in generalizing surveys. It is erroneous to say that in the urban centers red-figure pottery ceased to play any role around the middle of the fifth century. An interruption did take place more than a generation later and must have had various causes, among which the decline of Athenian production and the almost parallel rise of Etruscan red-figure workshops must have been of central importance. There is no evidence for the supposed “return to old native values.” There is, for example, no rise in the quantity of metalware.

In view of the wide dissemination of the imported pottery and the

knowledge of central but also of quite specific Greek myths that can be traced to the middle of the seventh century onward, in Etruscan culture at large and in Etruscan imagery in particular,²⁹⁶⁶ a further question arises. Namely, was the popularity of these types really due to the fact that the complex mythological imagery was understood exclusively by an elite who could bolster their social standing through this “control of myth information”?²⁹⁶⁷ By reducing these vases to elements in an urban elite display, and by analyzing them exclusively under the aspect of “elite material behavior,” a general assessment of their role in Etruscan society emerges that can hardly be considered convincing. The widespread frequency of these vessels in a large number of tombs, which is attested for the larger Etruscan necropolises, shows that we are dealing here with a wider cultural phenomenon, one which affected a large part of Etruscan society and is therefore of great interest in the assessment of social and cultural circumstances and interactions within it. The analysis of the data suggests a varied and very complex picture.

2Attic exports within Etruria and Greece: A comparison of two cemeteries

In the case of Etruria, Magna Graecia, and other regions of Italy, a considerable amount of data has been subjected to detailed analyses. These allow the study of both the dissemination and the significance of Attic pottery. For the same regions (as well as for the Iberian peninsula and, most recently, the Black Sea area), some studies provide valuable surveys of the extant material.²⁹⁶⁸ This is not the case for mainland Greece. A few exceptions aside (among them Olynthus),²⁹⁶⁹ there is a dearth of similar studies. This is surprising considering the amount of relevant data available.

The extensive data from various necropolises on Rhodes, for example, which after the extensive treasure hunting of the nineteenth century were excavated and published by Italian archaeologists in the early twentieth century, have largely been neglected.²⁹⁷⁰

2.1Macri Langoni, Kamiros (Rhodes)

Among the Rhodian cemeteries excavated in the early twentieth century, the Macri Langoni necropolis (Fig. 56.1) is of particular interest,²⁹⁷¹ not only because of its large dimensions and clearly defined topographical and chronological boundaries (later seventh to late fifth century), but also because it has yielded a vast number—more than 1,100—of artifacts, almost exclusively from single burials. The site therefore allows us to make statistically relevant statements and to compare the available data with

corresponding Etruscan sites. The chronological focus of the necropolis falls in the second half of the sixth century and in the years around 500.

Macri Langoni—on terraces hemmed in by the sea, a small valley, and a hill—contains 257 burials of newborn babies, children, youths, and adults. The various types of burials are laid out close to each other, and consist of 235 inhumations and twenty-two cremations; around forty of these contained no grave goods, and around thirty contained only scraps.²⁹⁷² In Giulio Jacopi's detailed publication of the material, 198 tombs were presented, of which three were clearly situated outside of the cemetery and are therefore not considered in the following analysis. Some of the grave goods were placed on or immediately beside the tombs, where, at least in some cases, a number of transport amphorae were also found. Of the remaining 195 tombs, 130 contained Attic pottery (Fig. 56.1), whose importation began around the middle of the sixth century and continued until the end of the fifth.²⁹⁷³

Fig. 56.1: Kamiros (Rhodes), Macri Langoni necropolis. Tombs with Attic pottery.
Drawing by T. Palugyay, Regensburg.

Vases from Athens are present only in reduced quantities. Almost three quarters of the burials with Attic pottery contained only one or two such vases; only rarely were more found (on average 2.23 vases). A detailed analysis provides the numbers shown in [Table 1](#).

Table 1: Number of tombs containing specified number of vases (Macri Langoni)

Vases/tomb	Tombs	Vases/tomb	Tombs	Vases/tomb	Tombs

2.2 Certosa necropolis, Bologna

The tombs of Felsina (Bologna), whose cemeteries are spread out along the ancient streets leading out of the city,²⁹⁷⁴ suggest themselves for comparison with the data from Macri Langoni because the burials fall into the same chronological framework. Moreover, the Felsina necropolises too consist almost exclusively of single burials and provide statistically relevant numbers of tombs and artifacts. Among the various cemeteries of Bologna, the Certosa area in the western part of the ancient city allows the strongest comparisons, not only because of the number of relevant tombs and grave goods, but also because it has been described in the most detail (Figs. 56.2.–56.3).²⁹⁷⁵ In the nineteenth century, 418 tombs containing both children and adults and dating from the later sixth, the fifth, and the early fourth centuries (with most burials dating from the fifth) were excavated at this site; 287 burials were inhumations, 131 were cremations.²⁹⁷⁶ As to the age of the deceased, the current state of research does not allow for conclusions as exact as those

reached for Macri Langoni. Of the tombs, 331 contained material, and the rest contained either no or almost no grave goods; in some cases grave goods were found but could not be identified and/or classified in any meaningful way. The tomb types are on the whole simpler; architectural features are lacking. Cremations occur much more frequently than at Macri Langoni.

Fig. 56.2: Bologna, Certosa necropolis, western part. Tombs with Attic pottery. Drawing by T. Palugay, Regensburg.

Fig. 56.3: Bologna, Certosa necropolis, eastern part. Tombs with Attic pottery.
Drawing by T. Palugyay, Regensburg.

The Certosa necropolis contained 196 tombs with Attic pottery (Figs. 56.2.–56.3), of which 440 examples were found (on average 2.24 per tomb). The analysis provides the details shown in Table 4.2977

Table 4: Number of graves containing specified number of vases (Certosa)

Vases/grave	Graves	Vases/grave	Graves
-------------	--------	-------------	--------

^a According to Zannoni; the identification is uncertain.

2.3 Comparison

The data from Macri Langoni, Kamiros, and the Certosa necropolis, Bologna, correspond in a number of cases but also show some important differences. In Bologna, grave goods were placed only in the tombs themselves but not, as in Kamiros, beside or on top of the tombs. In Macri Langoni, imported pottery other than that from Attica (from East Greece and Corinth) plays an important role,²⁹⁷⁸ whereas in Bologna such pottery is almost entirely lacking. Instead, local ware, which is not common at Macri Langoni, occurs with some frequency. Further differences can be detected in the other types of grave goods but will not be discussed here.²⁹⁷⁹ At both sites, Attic pottery occurs in burials of adults as well as children, both female and male. The number of Attic vases in the individual sets of grave goods is limited in both cases; for the most part, there are only one or two vessels in each tomb, and only in isolated cases are there more than five. The average number of vessels per tomb is almost identical in both cases (Macri Langoni, 2.23; Certosa, 2.24). It is true for both sites that Attic pottery constitutes an important part of the respective sets of grave goods, and that the vases were not chosen at random but were, as a rule, consciously selected according to shape and partly according to imagery. The range of types of Athenian pottery found at each site is roughly the same.²⁹⁸⁰ That fact that in each case there is a difference in the percentage of black- and red-figure vases in the overall record can be ascribed to the different peak periods of the two cemeteries. In both cases, works of famous artists are largely absent, especially in the case of red-figure pottery, and at Macri Langoni the pots tend to be of poor quality. Black-gloss ware plays an important role at both sites, constituting around 35% of the total of Attic pottery at Certosa and around 42% at Macri Langoni.²⁹⁸¹

For all three categories (black-figure, red-figure, black-gloss), the range of shapes found at Macri Langoni and Certosa is roughly the same. The two sites differ in that black-figure mastoid cups (a shape that was taken over from the Etruscan repertoire) and red-figure *skyphoi* are absent from Kamiros, and feeders and red-figure *lekythoi* are absent from Bologna. Furthermore, large vessels are rare at Macri Langoni. In terms of the frequency of the various shapes, there are even more remarkable differences. Kraters constitute the second-largest group in Bologna but are almost entirely absent from Macri Langoni, where instead *lekythoi* occur in large numbers, as is the case throughout Greece. In Macri Langoni, black-figure cups are common but red-figure cups are rare. The opposite is true for the Certosa. *Skyphoi* are very common in Bologna but quite rare in Kamiros. In Kamiros, *hydriai* were deposited in tombs relatively often, but only in individual cases in the Certosa necropolis. *Oinochoai* and *olpai* occur in considerable numbers at both sites. It seems to be the case, then, that the differences in the arrangement of the grave goods are greater than the similarities.

In the composition of the imported Athenian pottery in Bologna, there is a

clear tendency toward sets of banquet and symposium services (consisting of krater or amphora, cup or *skyphos*, and *oinochoe*)²⁹⁸² and hence a conscious choice which is further suggested by the frequency of symposium or *Komos* scenes.²⁹⁸³ A similar tendency does not appear in Macri Langoni, where similar sets are found in only three tombs. In tomb VIII, a black-figure neck amphora, a black-gloss *olpe*, two black-gloss cups, and a black-gloss saltcellar were found.²⁹⁸⁴ In tomb XVII, a belly amphora, a cup featuring a symposium scene, and a *skyphos*, all in black-figure, a red-figure cup with a *Komos* scene; and an *omphalos-phiale* in Six's technique were found.²⁹⁸⁵ In tomb CV, a column krater, a cup, a *lekythos*, all in black-figure, and a black-gloss *lekythos* were found.²⁹⁸⁶ It seems, then, that in Kamiros, symposium and banquet ware did not play any significant role in the choice of the sets of grave goods.

In Kamiros, the imagery of the Attic pottery is dominated by rather generalized scenes with clad female and male figures, warriors, animals, and ornaments.

Mythological scenes, including the labors of Heracles, are very rare, and only Dionysos and his entourage occur somewhat more frequently. In Bologna, the selection of scenes is larger and more varied. This could simply be attributed to the fact that large vessels are present in the record in greater numbers.

One remarkable difference between the two sites is the frequency of miniature vase shapes in Macri Langoni. Importantly, these miniature vessels are not restricted to child burials, as is the case in Bologna. A possible explanation of this phenomenon may be that in Bolognese burials, shapes and sizes occur which were used in everyday life, whereas in the case of Kamiros it may be a matter of pottery specially produced or bought for use solely in tombs.

IV. Civilization

Late Classical and Hellenistic periods

Fernando Gilotta

57Late Classical and Hellenistic art, 450–250 BCE

Abstract: This chapter deals with developments in Etruscan culture in a crucial and troubled period of transition, from the collapse of the Archaic world to Middle Hellenism and the almost total conquest of southern Etruria by the Romans. The specifically architectural side saw the construction—or rebuilding and restoration—of major temple buildings, both of peripteral and (mainly) of Tuscanic type, in the coastal areas as well as in the prosperous towns along the Tiber Valley, reaching as far as northern sub-Appennine Etruria and Marzabotto. Town walls and dwellings are also briefly surveyed, with reference to local building traditions and to Greek models for specific defensive devices and for the adoption of “atrium-type” houses. The best achievements in sculpture for the fifth and fourth centuries BCE seem to be concentrated in the rich towns of the Tiber Valley area (from Falerii up to Chiusi and Arezzo), thanks to a wide circulation and *Umbildung* of models (of “Severe” and Classical imprint), most probably through the major production centers of the western Greek world. Wall painting, still essentially from the Tarquinia area, seems to be rather conservative in style and repertory—influenced as it is by ritual images and signs—and shows a considerable propensity for the persistence of several old figural themes, celebrating the deceased’s social role in life and his destiny in the Netherworld. At the end of the fifth century, a new system of funerary themes centered on the Netherworld, with its gods and daemons, comes to the forefront with the Tomb of the Blue Demons, and was destined to be reproduced with variants and extended throughout numerous Tarquinian hypogea of the fourth and third centuries.

Splendid architectural sculptures belonging to temples, and many fragments of sculpture in stone from tombs or *naiskoi*, which seem to be inspired by works of great masters that were probably echoed through vigorous exchanges with neighboring Magna Graecia, can be assigned to the new Late Classical/Early Hellenistic koine, which predominated from about the mid fourth century to the first half of the third.

1Architecture

The period between the mid fifth and mid third centuries hosted crucial stages in Etruscan civilization, from the *Interimperiode* following the collapse of the Archaic world and its economic and cultural structures, with a general readjustment of power balances in the Italian peninsula, particularly its Tyrrhenian coast, to Middle Hellenism and the almost total conquest of southern Etruria by the Romans.

The undeniable crisis experienced by the towns, especially in the south and on the coast, after the epoch-making clashes (and defeats) of the first decades

of the fifth century, did not, however, involve complete stasis in the organization of towns and sanctuaries, or in artistic production and handicrafts. Changes in Gravisca, Pyrgi (and, later, Volterra), to indicate just some of the more interesting sites, include a presence of worshippers and cults of Western Greek origin previously totally unknown in the heart of Etruria. This concrete premise of a Western Greek “influence” in Etruscan material culture—always assumed, but never completely and convincingly motivated historically—will be briefly mentioned below. Yet again, as far as sanctuaries are concerned, on the specifically architectural side we see the construction, or rebuilding and restoration, of major temple buildings, both in the coastal areas and in the prosperous towns along the Tiber Valley, reaching as far as northern sub-Apennine Etruria and Marzabotto.

1.1 The peripteral temple

Temple A on the Marzabotto acropolis (dated around the middle of the fifth century, with an assumed peripteral plan of 7×4 columns, on a podium, with a long, narrow *naos*) seems to lie in the wake of experiments such as the Tempio Grande at Vulci and temple B at Pyrgi. Our understanding of its architectonic relevance, however, has improved with the discovery of a second peripteral temple, dedicated to Tinia, in the urban area of the same town, dating from the early decades of the fifth century. Western Greek monumental models were assimilated and reformulated in this inland and Apennine context in the Late Archaic and Proto-Classical periods, probably thanks to the pliant and still pervasive mediation of southern Etruscan centers, as would seem to be indicated by other, fragmentary evidence from Chiusi, Arezzo and Volterra.

1.2 The tuscanic temple

Most of the remaining sacred edifices are of Tuscanic type. The Belvedere Temple, the only one of the numerous Orvietan temples whose ground plan is known with some certainty, was undoubtedly built in the first half of the fifth century, but was remodeled at the end of the same century, as shown by a set of pedimental high-reliefs. The building opened on the back side of a *temenos*, had a roughly square shape, with the central *cella* wider than the side ones, a double row of columns in the *pronaos* not in line with the walls of the *cellae*, and access steps, with proportional modules similar on the whole to Vitruvian ones. The votive inscriptions, altars with central hole, cippi with lightning in relief, ensure its connection with a chthonic cult of *Tinia Caluśna*.

Not very different from the ground plan of the Belvedere Temple is that of

the sacred building discovered at Piazzale del Cassero (Castiglion Fiorentino). Located in an area of Val di Chiana between Cortona and Arezzo, it was crucial to the control of the roads running through the valley and thus open to cultural experiment of various origins. Conspicuous fragments of architectural decoration, belonging to a stage dating to the mid fourth century, reveal significant matches with materials from sacred buildings at Orvieto and with the Belvedere itself.

Fig. 57.1: Tarquinia, Ara della Regina temple, phase III. Late Classical-Hellenistic period (after Bagnasco Gianni 2011, 51 fig. 1)

More or less of the same period, according to the most recent research, is the temple at Fiesole, rebuilt in Tuscanic style, with central *cella* and *alae*, two (?) columns and access steps in front. Nothing is known about the roof covering, to which belong excellent figured reliefs preserved only in fragments, while its attribution to the cult of Menerva currently appears to be based solely on weak evidence.

The temple of Celle at Falerii (Ager Faliscus, in the Tiber Valley), outside the properly defined Etruscan area, is dedicated to a female deity, probably Juno Curitis, and again features what has recently been tentatively reconstructed as a square ground plan, a *pars postica* made up of a central *cella* and two *alae* and a *pars antica* of similar dimensions, and a double row of four columns in front. Several architectural and decorative stages have been identified between the fifth century and the Late Classical period.

Different or more uncertain, on the other hand, are the versions of Tuscanic

ground plans known from other places. This is the case, for example, of the building at Fontanile di Legnisina (fifth–fourth centuries)—a suburban Vulcian sanctuary close to a road into the town, which housed the cults of Uni and Vei—with *cella* and *alae* and columns in front delimiting an ample (perhaps double) *pronaos*, in which part of the sacred rites were celebrated.

Fig. 57.2a-b: Cerveteri, Sant'Antonio, temple A, assumed plan and column.
Hellenistic period (after Maggiani 2008, 131, fig. 16b; 135, fig. 25)

The ground plan of the first phase (middle to second half of the fourth century) of the temple on the acropolis at Talamonaccio, in the Albegna Valley (Vulcian territory), must have been rather long. It was built in the Late Classical period, again with *cella*, probably *alae*, and *pronaos* with a double row of two columns, aligned on the front with the side walls.

The most relevant architectonic enterprise of the period (around the middle of the fourth century) is the complete remodeling of the Ara della Regina temple at Tarquinia, a town once again of primary importance as the protagonist against increasing Roman expansionism. This large sacred building, perhaps dedicated to *Artumes*, rose on a foundation of tufa blocks. The south side of the facade included a large terrace that gave access to the temple itself by means of a flight of steps made monumental by two projections with a molded base. The temple's ground plan seems to combine

elements typical of the peripteral, such as the extended plan, with what are essentially Tuscanic structural features, such as the central *cella* (probably with *alae*) and side walls reaching the facade and enclosing a double row of two columns provided with “Ionic-Italic” capitals (Fig. 57.1).

In the first half of the third century, Temple A (dedicated to Hercle) at Sant’Antonio at Caere was remodeled with a Tuscanic plan similar to that of the Late Archaic phase, with a colonnade of four columns in front and a second row of two columns aligned with the side walls. Tufa architectural fragments have made it possible to reconstruct the fluted columns with figured capitals, showing human heads (*Hercle* and *Acheloos*?) enclosed between scrolls. These are similar, but not identical, to those found in other Late Classical and Hellenistic architecture in southern Etruria, which were probably inspired by roughly contemporary Western Greek models (Fig. 57.2a–b). For the time being, it is difficult to say whether the temple was refurbished before or after the events of 273, which saw Rome deprive Caere of its autonomy, for the celebration of which a subterranean area was created in the town center with the inscription of C. Genucius Clepsina, perhaps the *mundus* of the new “refounded” Caere (Fig. 38.3).

1.3 Shrines

The knowledge of shrines has substantially increased over the last decades at both major sanctuaries and minor cultic sites. For the period we are examining, we refer to the *gamma* (mid fifth century) and *alpha* (roughly one century later) buildings in the Area Sud of Pyrgi, both without podium, with a rectangular and square ground plan respectively, and an off-axis entrance to safeguard the secrecy of the rites. They housed cults to *Śuri* (*gamma*) and *Cavatha* (*alpha*), and were furnished with benches along the facade, apparently intended for the comfort and rest of devotees. The ground plan of each shrine is of the *oikos* type, one of the most ancient types of sacred Etruscan edifice.

1.4 Town Walls

The crisis of the fifth century, with its traumatic military repercussions, followed by growing aggressiveness from Rome in the fourth and third centuries – which ended, as noted above, with the fall of the southern Etruscan towns – favoured the creation or rebuilding of town walls, which are still visible in the Etruscan landscape even today. These were mostly built in ashlar masonry, particularly in central-southern Etruria, owing to the abundance of tufa, a soft and easily workable stone, albeit with different

typologies and a considerable variety of solutions, sometimes even within the same circuit. The major towns were provided with walls, as also numerous smaller ones that controlled territories from strongholds strategic in position and elevation. The functional and ideological relevance of the defenses was often emphasized by the location of liminal cults close to the town gates, as, for example, at Tarquinia, Vulci and Cortona; but on the whole, fortifications never lost their primary character as utilitarian constructions and rarely reached high technical standards.

The fortification system of Caere appears to be substantially adapted to the structure of the tufa plateau on which the town rises, consisting of works differing in structure and defensive purposes, which, between the late sixth and the fifth or fourth centuries, covered the long sides of the plateau. At Tarquinia, between the fifth and fourth centuries, an actual circuit of walls enclosed a relatively large area, including Pian di Civita and Pian della Regina, the sites of the town itself, and the nearby Castellina hill (once deemed the town's acropolis). In this latter case, the technique adopted—*isodomic ashlar masonry*—appears to be largely heir to that used in all probability for the smaller circuit of the Archaic period. Only at a few points is it possible to see the *emplecton* building technique, with a double curtain of blocks and an inner filling of stones and earth, which was also known in Etruria from archaic times. Well known among the defenses at Tarquinia is the gate on the northern side, at the narrow point between Pian di Civita and Pian della Regina, of the inner-chamber type, perhaps with a vaulted roof, which was inspired by Greek defensive architecture of the Classical and Hellenistic periods and, as we shall see, was also adopted at other sites.

Recent research has helped reconstruct a single circuit of walls at Vulci, dating to the late fourth century, which was mostly built in *isodomic ashlar masonry*, but with sections using the *emplecton* technique. It was provided with defensive devices such as the triangular structure at the West Gate, whose chronology, immediately prior to the Roman conquest, may prove the adoption of actual defensive war engines necessitated by the impending clash with Rome.

Cases of elaborate defenses are not lacking in the smaller towns of southern Etruria, either. In the hinterland of Tarquinia at Musarna, a *proteichisma* and a moat on the east side of the fortifications—part of a system of *aggeres* and mighty ashlar walls—appear to have a protective function with the purpose of delaying the progress of enemy troops and war machinery. Similarly, at Ghiaccio Forte, a fortified site of the *ager volcentanus* in the Albegna Valley, the wall circuit built using the *emplecton* technique, perhaps with mud bricks, had three monumental inner-chamber type gates. Unlike the walls, these were constructed with care and, it appears, protected by towers or outward projections from the walls.

In northern coastal Etruria, the remains of the wall circuit of Populonia are particularly conspicuous. Their dating is still debated, owing to destruction

over the centuries (including in modern times) and stratigraphic complexity. Recent research tends to favor an early chronology, for both the circuit around the acropolis, which might date to the Late Archaic period, and the wall around the lower town, from Cala S. Quirico as far as Baratti, which was built in ashlar masonry and provided with (at least) two towers. The various stages of the last circuit may date to between the fifth century and the Early Hellenistic period. This chronological assumption would of course coincide with the most critical moments of the town's history.

Outside Etruria, but of great relevance for the history of the Etruscan presence in the central-western Mediterranean, fortifications were discovered in the Genoa *oppidum*, on the Castello hill, in a position dominating the coast. This strong circuit, dry-laid using the *emplecton* technique, and with a double face of regular rows of well-squared blocks, seems to date to the first half of the fifth century. It is thus more or less contemporary with the building of the walls surrounding Populonia, and with the reinforcement of the Etruscans' presence in the Po Valley area as well as in indigenous contexts in nearby southern Gaul.

Among inland northern Etruscan towns, the wall circuit of Cortona—which appears datable to the Late Classical period (fourth century)—was built of large roughly squared blocks, and must have seen partial rebuilding in the second century, probably including the double-arched Porta Bifora. In most recent proposals, the travertine wall circuit of Perugia is dated to the mid third century, a period of great development for the town, which was located along the line of northward Roman expansion. The circuit, seemingly inspired in its building technique and defensive devices by sophisticated Hellenistic models, is provided with gates, some monumental and covered with arches, and some arranged in pairs, one in front of the other, to facilitate crossfire against the enemy. The two main gates, Porta Marzia and Porta di Augusto, are worth noting for the two towers that flank them and for the elegant and elaborate two-story architectonic facade with busts of deities.

A great circuit of irregular, pseudo-polygonal walls—not rare in northern Etruria, due to the lack of soft tufa-type stone that is so abundant in the South—was erected at Volterra in the late fourth century, considerably extending the area protected by the previous walls, which must have left plenty of open spaces. The main roads began, at both the south and the north, from the town's inner-chamber type gates. The southern gate, known as the Porta dell'Arco, was provided with three plastic heads at the base and on the keystone—probably the tutelary deities of the gate itself. Though rather worn, these heads unquestionably belong to the Early Hellenistic tradition and are also fundamental for the dating of the entire defense system.

Lastly, the wall circuit of present-day Orbetello, in the *ager volcentanus*, must be briefly mentioned. Its magnificent polygonal technique seems to have been the model used for the walls built by Roman colonists at nearby Cosa.

1.5Dwell6ings

Among the most relevant architectural evidence are functionally highly developed and sometimes monumental versions of dwellings belonging to the fifth century. It can now be said with certainty that the ground plan of the “Pompeian” house, with an atrium and numerous rooms arranged around a central courtyard, is the result of experiments in Middle Tyrrhenian—Etruscan and (later) Roman—contexts, starting at least from the second half of the sixth century. Their line of development is linked to the concept of houses, sacred buildings and tombs that can be traced in the Etruscan milieu starting from the Orientalizing period. They favor a division between the front part of the house (Lat. *antica*) near the entrance, for receiving guests, and the inner part of the house (Lat. *postica*), which comprised the actual living quarters. The most significant evidence of this type of establishment is to be found in a newly founded “colonial” (see [chapter 76](#) Malnati) town like Marzabotto. This town was designed with rationally arranged spaces within an orthogonal urban grid, and was used for the more central districts with buildings of greater prestige and of greater size (Insula IV, 1, 2, probably dating from the mid fifth century). Here we see a long entrance corridor and a central cruciform courtyard with a well, in which we recognize the layout of a Roman-type atrium, with *tablinum*, *alae* and *cubicula*, clearly celebrating a function and social status of absolute preeminence ([Fig. 57.3](#)).

Fig. 57.3: Marzabotto, Casa degli Ippocampi (IV 1, 2), plan. Second half of the fifth century (after Häuser 2010, 107, fig. 2d)

The type of building with a square ground plan and rooms arranged around an open central courtyard and *compluvium* sometimes delimited by a portico,

is well rooted in Etruria between the Late Archaic period and the fifth century, even in suburban and rural areas. It was sometimes used for residential purposes, and sometimes for the storage and/or processing of agricultural produce. Among the most interesting examples recently found is the Casa delle Anfore at Poggio Alto, a few kilometers south of Poggio del Castello (Marsiliana). Some of the structure's rooms contained a conspicuous number of Etruscan transport amphorae and domestic pottery, certainly pointing to its use as a store for food products, in a territorial context involved in considerable demographic and economic expansion at that time.

Specimens of residential architecture are abundant also for the period between the fourth and the third centuries, in both major and minor towns and even at boundary sites. At the aforementioned Ghiaccio Forte, a residential complex dating to just before the Roman conquest between the late fourth and early third centuries has been excavated. It includes storage rooms, kitchens, bathrooms, and rooms for domestic activities, in which partial affinity to Greek dwelling-house architecture of the Late Classical and Hellenistic periods has been observed. Again in the Po Valley area, the town of Spina certainly still possessed outstanding dwelling structures in the fourth century; in its northeastern area, a house has partially been brought to light, with several rooms arranged at right angles around an open space. For this important center in the Po Delta, even the structural features of floors and elevations can be described with a degree of precision. Light perishable materials were used on timber skeletons, some of which had pitched roofs supported by large timber pillars.

1.6Funerary architecture

In some major southern Etruscan towns (Veii, Caere, Tarquinia), the most frequent tomb structure is a simple single chamber, as was already found in the Late- and Sub-Archaic periods. In some cases, however, the chambers were later extended in size and provided with open niches at the sides, and sometimes, with separate rooms at the back, which were destined to receive the married couple with great display of wealth. The owners of the Tomb of the Reliefs, Tomb of the Alcove, and Torlonia (second half of the fourth century) at Caere, for example, were probably members of the aristocracy who, during the Late Classical and Early Hellenistic periods, were protagonists of an extraordinary economic and cultural regeneration, open to the ideological standards and fashions launched by the Hellenic and Hellenizing elites of Macedonia and Magna Graecia. In the same decades, however, there were tombs still concretely inspired by a more elaborate domestic architecture, among which the most distinguished examples are the Tomb of the Shields at Tarquinia, with its cruciform plan around an atrium, and the François Tomb at Vulci (last third of the fourth century), with its

complex star-shaped plan around several rooms and its coffered ceiling imitating both civil and sacred architecture. The Grotte Sant'Angelo Tomb, again at Caere, which dates to the second half of the fourth century, is an architectonic complex with a monumental facade, a courtyard with two sepulchral chambers, and a terrace. The tomb commits its commemorative message to a planimetric and monumental complexity and rich plastic decoration, which is unrivalled in Etruria. Roofing the interior of one of the burial chambers is the most ancient (and refined) example of the adoption of barrel-vaulting in the region, according to a Macedonian model perhaps transmitted with Western Greek—and particularly Neapolitan—mediation.

Excluded from this brief general view, owing to their typological-stylistic specificity, are problems concerning the rock-cut tombs, which are among the most refined and original specimens of architecture of Hellenistic type in the Italian peninsula.

2Sculpture

As mentioned above, the end of the Archaic period was followed by a transition—the Interimperiode—during which it appears that, from a formal and ideological point of view, Middle Tyrrhenian material culture was no longer moving in perfect parallel with that of the Greek world. The reasons are many, and their effects seem to overlap. The end of an urban koine civilization—markedly Greek and to a conspicuous extent East Greek—which had involved the Hellenic, mix-Hellenic and barbarian cultures, and which in Etruria had seen wide acceptance and creativity, led to the rise of new regional realities that were accompanied by new political ideologies, economic structures, and cultures. Thus, Athens saw the birth of a “Severe” and then Classical style that, flourishing on the ruins of the Persians’ destruction of the Acropolis, were nourished by a favorable economic situation and febrile intellectual activity. These styles reached heights of originality clearly connected with the philosophical and political developments of the civic community, and were difficult to export as such to environments lacking similar ideals. What happened in Etruria is, so to speak, the other side of the medal. Particularly in the coastal town, the people of Etruria, defeated in the epoch-making clashes with the emerging Western Greek powers (in 474), appear to have retreated within themselves, continuing to draw on their own abundant tradition in major arts and handicrafts. At least during the early decades of the period, there was a contraction in production and consumption as a result of the spread of political models of oligarchic nature. Not all was stagnation in Etruria, however. The archaeological traces of attendance at the major southern Etruscan sanctuaries by Western Greeks during the first half of the fifth century have already been mentioned, which must have had

repercussions on the degree of acculturation by local populations. Also to be remembered are the always-open channels between Spina and the Greek world, and the prosperity of the Tiber Valley towns, whose wealth depended on their abundant agriculture and the overland exchanges with two of the most important poles of development in the peninsula at that time: Hellenized southern Italy and the Po Valley world, which opened onto the Adriatic Sea. For any historically complete analysis of the artistic expressions of the period, the scarcity of major monuments also requires taking into account minor handicrafts (see [chapter 58](#) Ambrosini), of which there are signs of a fair degree of lively receptivity. The possible public results of this—particularly as far as sculpture is concerned—have been irremediably lost.

The delay in comparison with the evolution of the formal Greek (actually, Athenian) *Vorbild* and our recognition of the most significant centers of stylistic development should therefore be read with full awareness of all the phenomena briefly described here and in the certainty, as also indicated by the latest surprising archaeological discoveries, that our knowledge has the precarious nature of a jobsite perpetually under construction.

2.1 Classical sculpture

The Late- and Sub-Archaic sculpture from southern and northern Etruria, with a sound formal coherence and acceptance of the dictates of an international, Ionic-Peloponnesian style, was followed in the mid fifth century by pieces embodying the canons of the Severe and Classical styles. This was true especially in the towns of the Tiber Valley (Veii, Falerii, Orvieto, Chiusi, as well as Cortona and Arezzo), perhaps as a result of the direct contribution of Western Greek craftsmen. The excellence of the clay mold with a female head discovered in 2008 at Orvieto, datable to between 460 and 450 BCE ([Fig. 57.4](#)), reveals a formal culture recognizable as the one traced in the major sculptural creations as well as in the votive terracottas of eastern Sicily. The characteristics of this new work, moreover, make it possible to introduce and more easily understand one of the most important groups of Etruscan sculpture of the period—namely, the stone cinerary urns of Chiusi, thus saving from their isolation specimens of very high quality, such as a splendid fragmentary head at the Chiusi Museum. After the “tyrannical” eclipse of the Porsenna period, the funerary sculpture of Chiusi—whose clients were members of the local aristocracy in a position to order rich chamber tombs between the second quarter of the fifth century and the outset of the fourth—consigned its commemorative message to statues of enthroned female figures, recumbent male personages accompanied by daemons of death, and married couples with the wife seated on a *kline* and later recumbent on a couch beside her husband. The language used in these sculptures, while preserving a certain rigid composure, gradually incorporates, together with Sub-Archaic features,

elements that were certainly inspired by Classical models (hairstyle, facial features, arrangement of folds). A similar formal approach is shown by the prestigious votive terracotta sculptures from the sanctuary of *Menerva* at Veii (Fig. 57.5). Veii was a town that, owing to its geographical position, had always readily accepted foreign models (and, perhaps, craftsmen), including those from Hellenized southern Italy. The funerary and votive spheres were consequently the primary points of reference for both urban and rural aristocratic clients of the fifth century. For them, sculptors in stone and terracotta could provide commemorative imagery (relating to their other-worldly destiny, or self-portrayal before the deity) aware of the latest trends in Greek style, thanks to the circulation of models, or even molds, most probably through the major production centers of the Western Greek world.

Fig. 57.4: Terracotta mould for a female head, from Campo della Fiera, Orvieto, excavations 2008. Mid fifth century. Orvieto, Archaeol. Mus. (after Stopponi 2009, 471, fig. 33)

Also from the Tiber Valley area comes one of the most celebrated (and rare) large bronzes that have come down to us: the Chimaera, a valuable votive offering dedicated in a suburban sanctuary of Arezzo, located at the entrance to major communication routes. Recent research indicates a dating to around the end of the fifth century to the beginning of the fourth, and attributes it to a workshop either at Chiusi or even Arezzo itself. Its overall naturalism, the plasticity of the muzzle, and the stylizing of the coat, all seem to point to Attic or southern Italian experiments in monumental sculpture, transferred to Etruria perhaps through the activity of (itinerant) Western Greek masters, who followed similar methods of transmission for same period as were found in the less prestigious sectors of painted pottery and small decorative sculpture. Another exceptional bronze object, the Cortona lamp, is also a votive offering. Its relief decoration reveals adherence to the canons of the Ripe Classical period (end of the fifth century–beginning of the fourth), reinterpreted—particularly the *gorgoneion* and the masks of Acheloos—with Tiber Valley, and perhaps Orvieto, nuances.

Fig. 57.5: Terracotta female votive statue, from the Portonaccio sanctuary, Veii. Second half of the fifth century, Rome, Museo Nazionale Etrusco di Villa Giulia (Photo SAR-Laz)

Starting from the late second half of the fifth century, with increasing public clients, sacred places continued to be, or rather were once more, the main destination for major sculptural works embellishing both new and renovated temples. Once again, the towns of the Tiber Valley provide the most meaningful evidence. Of them all, Orvieto occupies a place of particular importance, as the strategic center for all of inland Etruria and a natural bridge to the Italic areas on the eastern side of the peninsula, as well as the seat of a major federal sanctuary. Architectural terracotta remains of the decoration of several temples (only one of which—the Belvedere—is sufficiently known in terms of its ground plan and related cults) testify to the existence of a major local coroplastic school, which worked for public bodies desirous of celebrating their ethical-genealogical profile and the town's political destiny through the narration of mythical events. The extremely fragmentary condition of the sculptures makes it difficult to define with any certainty the themes portrayed or composition models adopted, but we can certainly appreciate the formal ability of the *plastai* who produced them. The Classical canon in fashion at Athens in the last thirty years of the fifth century, of which the best evidence in Etruria is a single splendid head—now in the British Museum—that may be of Orvietan provenance, can be described in the Via S. Leonardo heads (late fifth century). They do, however, exhibit some rigidity in rendering facial features—as in the lengthened cut of the eyes and mouth and rendition of the beard. Better preserved is the cycle of the temple of *Tinia Caluśna* at the Belvedere (final decades of the fifth century), in which an assembly of heroes seems to take part in an event of special importance. In this case too, the expressive language appears aligned with the noble models of major Hellenic sculpture—from the eastern pediment of Olympia, to the Parthenon metopes, to draped post-Pheidian statues—albeit with stylistic streaks of “severity.” Such a style must have become widespread among local sculptors and craftsmen, and significant echoes of it are found in later decades, even in works such as the Torre San Severo stone sarcophagus and in small bronze and terracotta Instrumentum-sculptures. The posture of some of the statues of the Belvedere cycle may be understood only as having assimilated the *Kanon* of the great Argive artist Polykleitos, of whom however only a partial echo is found here (as in Etruria, generally speaking), due to a substantial Etruscan extraneousness to the theoretical reflections underlying the Hellenic Polykleitan creation.

At roughly the same time, the same tendencies appear in a major bronze, the so-called *Mars* from Todi, which is probably once again from an Orvietan workshop. It is not known whether this work was a votive statue in the strict sense or a cult image. Any chiastic portrayal appears to be betrayed by the feet, which are both firmly planted on the ground, by the wide arm gesture, and by the cuirass, which diminishes the balance of the composition while stiffening the torso. Its relationship to one of the Belvedere warriors is very strong, and the modeling of the face certainly recalls on the whole the

sculptures from Chiusi, Veii, and Orvieto. In the same geographical area, but to a slightly later period, belongs another basic bronze work. This is the head from Lake Bolsena, which may have been part of a votive (or honorary) statue. The construction of the face and hair, similar to that of later funerary sculpture from Chiusi, is accompanied by a very light outlining of facial planes and beard, giving it softly individual features unlike the rather more mannered and academic Classicism of the *Mars*.

2.2 Late Classical and Hellenistic Sculpture

The traumatic events of the conquest of Veii by Rome in 396 and of Syracusan pressure on the Tyrrhenian coasts (the sack of Pyrgi in 384) triggered a change in the Etruscan world. This was destined to accelerate with the increasing ascent of Rome, with the overall restructuring of territorial management and the strong commitment of the new aristocracies to occupying or reoccupying minor towns, thus starting a process of social maturing and development that embraced and strengthened a wider middle class. Starting from the mid fourth century, new conditions of mobility arose from international changes, from the rise of Macedonia as a dominant power, to the activism of Greek *condottieri* in southern Italy. This led to a gradual overcoming of the cultural barriers created during the fifth century, thanks also to the dynamism of greatly expanding Western Greek centers like Taranto. It also supported the establishment of a new Mediterranean koine, whose pillars were Macedonia itself, the northern Greek potentates, the more developed areas of Magna Graecia and, subsequently, Alexandria. The whole Etrusco-Italic Middle Tyrrhenian area benefitted from the new climate and took part in the splendid cultural flowering that marks the entire Late Classical and Early Hellenistic period.

In the early decades of the fourth century, among the more properly Etruscan centers of the Tiber Valley, a role of absolute prominence must be given to Falerii and the *ager faliscus*, a cultural area that, lying just to the north of Rome, assumed prime importance after the fall of Veii, including as a bastion against Roman expansionism. Numerous temples must have been built or renovated during this period, following a tradition that had already been well consolidated in the previous century. The group of terracottas from Scasato II (ca. 380), belonging to an urban temple that may have been dedicated to Minerva, comprises fragments of a complex composition with divine personages and flying chariots against a backdrop of clouds. Their stylistic characteristics—albeit obscured by a certain atony and heaviness in the faces—reveal the strong inspiration of Attic Classical style of the late fifth century (Fig. 57.6), a style also echoed widely in outlying environments even outside Etruria. Evidence of the high quality achieved by Faliscan coroplastic workshops was also found in the suburban sanctuary of *Juno Curitis* in the

Celle district in the form of an extraordinary statue of a draped female deity, still largely retaining its original polychromy; in the suburban sanctuary of Sassi Caduti, with the fragmentary relief figure of Mercury (etr. Turms), whose slender lower limbs recall the sensitive plasticity of an image by Praxiteles or an early Lysippos; and in other cult places in the area, with two figures of *Nikai* (?) that are very similar to the best architectural sculpture produced by Hellenic centers between the end of the fifth century and the early fourth.

The influence of the schools of *plastai* active in the Tiber Valley towns, first and foremost at Orvieto, must have been considerable, since its traces can be recognized in fragmentary architectural remains even in central coastal Etruria (e.g., Talamone, Vulci) and northern inland areas, from the Val di Chiana (Castiglion Fiorentino, Arezzo) as far as Fiesole.

Again within the context of terracotta sculpture (whether votive or, more often, architectural), among the most significant discoveries belonging to the fourth century (perhaps the first half) is a fine beardless head of Heracles. In a language permeated with "Falisco-caeretan" and Latial stylistic traits, its lengthened face seems to recall images of the Late Classical period, which had been known so far in the Middle Tyrrhenian environment only through a minor series of small bronzes, appliques of precious metals or relief-pottery of purely Greek and Western Greek inspiration. This rare piece contributes to our knowledge of the southern Late Classical schools that not long after were capable of producing works of great refinement, such as the statues of the renovated Temple A at Pyrgi, among which should be mentioned an extraordinary "Praxitelean" Heracles (?).

Fig. 57.6: Terracotta fragmentary bearded head, from the Scasato II temple, Falerii. First half of the fourth century. Rome, Villa Giulia (Photo SAR-Laz)

In any overview of fourth century sculpture, a fundamental role, particularly in southern Etruria, is played by images of the deceased sculpted on the lids of stone sarcophagi that decorate the chamber tombs of members of the middle and upper classes and of the aristocracy. Quite clearly, although wholly private, they appear to be highly representative of the status of the deceased and sometimes even indicate his religious or political role within the community, thus partly compensating for the lack of actual public honorary statues. The origin of the sarcophagus with a figured cover is still uncertain. It must have incorporated the local tradition of the cinerary urn with the deceased semi-recumbent at a banquet or portrayed stretched out on his deathbed, which is well attested between the Archaic and Classical periods

both in southern Etruria and, as noted above, in the Chiusi area. However, chronological coincidences, specific typologies of lids, and the concentration of the most ancient specimens in southern Etruria lead us to believe that even outside models were not wholly foreign to this process.

Mid fourth century stone sarcophagi found in Etruria—such as the Sarcophago del Sacerdote, from the tomb of the aristocratic Partunu family at Tarquinia—portray the deceased supine on the cover in a standing (if seen from above) position. Such valuable marble products were created mainly for Punic customers (in Carthage) by craftsmen of Greek training and origin (Paros?) lending the figures of the deceased features of a purely Late Classical Greek imprint. Creations such as the bearded face attributed to the deceased member of the Partunu family were probably well accepted in Etruria by local craftsmen, as appears to witness the man's face on a double sarcophagus from Vulci that belonged to the Tetnie family and dates to the mid fourth century.

At Caere the oldest sarcophagus in the Tomba dei Sarcofagi (dating to the second quarter or middle decades of the fourth century) reveals in the typology of the deceased on the lid links with the just-mentioned sarcophagi of Greco-Punic manufacture, which reached Etruria in the same period and, perhaps, even with their anthropoid antecedents. This sarcophagus is accompanied in the same Caeretan tomb by other architectural type specimens, with ridged lid and with no figure of the deceased, which in turn imitate sarcophagi from Greek workshops. The face of the Caeretan deceased, who was certainly a person in the public eye (a magistrate?), is characterized by an anonymous and remote dignity, permeated by “Severizing” stylizations, which are comparable to contemporary funerary and votive sculpture and wall-painting.

Later, from the second half of the fourth century to at least the first half of the third, the main schools of southern Etruscan sculptors—first and foremost in the Tarquinian area—gave rise to an abundant production of sarcophagi, as shown by the tombs of the prominent and emerging classes in the towns and their hinterland, whose material was the cheap local stone, *nenfro*. The deceased is portrayed standing in the manner of Greco-Punic specimens, stretched out on his deathbed or banqueting, with an increasingly marked twist and raising of the torso toward the onlooker. The deceased are characterized by faces whose massive structures are often spherical, in an attempt to reproduce to some extent the features of an adult or an old man. These faces bear traces of an intent to portray only a generalized indication of age and social and intellectual status. This was variously interpreted over the decades. At the beginning, faces are of sub-Polykleitan or purely Classical type, with measured plastic treatment of single traits. Later, inspiration was drawn from the best of Late Classical and Early Hellenistic portraits, first and foremost the dynastic images of Alexander and the Diadochoi. An echo of these images reached Etruria through numerous channels of exchange, largely reactivated on the Italian peninsula, and also through the fruitful presence of

major Greek artists in nearby southern Italy (see [chapter 36](#) Haumesser). The final result of this multifaceted process of assimilation and re-composition was consequently not the formulation of truly physiognomic portraits, nor—as has recently been assumed (Papini)—the mechanical adoption of Hellenistic portrait standards. This latter suggestion would consequently involve the greatest caution in proposing a dating of Etruscan sarcophagi on the basis of their (presumed) automatic equivalence with the portraits of eastern Mediterranean sovereigns.

Such sarcophagi, however, constitute important evidence of the developments in Etruscan sculpture at the end of the fourth century and first half of the third, also as regards the wide repertory of reliefs that embellish the various typologies of their boxes. This includes episodes from Hellenic and sometimes even local myth celebrating or evoking the funerary dimension (e.g. Amazonomachies) in an iconographic guise that is largely, but not exclusively, of Western Greek origin. These subjects are increasingly, and with an ever more rough and simplified style, accompanied by images of the separation brought by death, of the journey to and arrival in the Netherworld, in ambiguously-set parades (earthly or chthonian?) that may take on the character of actual magistrates' processions, aimed at emphasizing the social prestige of the deceased in life.

Apart from sarcophagi, the funerary sphere has also provided us with valuable, albeit fragmentary, sculptural evidence belonging to the Late Classical and Early Hellenistic periods. Indeed, many such fragments of stone sculpture belong to the architectonic decoration of tombs or *naiskoi*. These include figured capitals with human faces in vegetal calyxes, heads of Gorgons or of death daemons (Charun) that probably belong to ceilings or architraves, and sculptural groups with figured scenes (Amazonomachies). They also include images in full relief of animals and fantastic creatures that embellished monumental tomb enclosures, discovered in the principal towns of southern Etruria (Caere, Tarquinia, Vulci). Both the style and function of these sculptural embellishments largely derive from the contemporary creations of Magna Graecia (particularly Taranto). There is no lack, however, of interesting sculptural specimens (e.g. Caere, Grotte Sant'Angelo) in which a conservative stylistic approach appears to be deliberate, aimed at defined and recognized ritual messages. Furthermore, fragments of figured funerary stelae have been found at Tarquinia, their typology and style accompanying the sarcophagi with figures stretched out on the lid discovered in the same town, and also hinting at partial inspiration from Greco-Punic models. Lastly, we must mention the draped female figures of stone or marble found at Tarquinia and around Volterra and used as funerary *semata*. Their iconographic-stylistic characteristics reveal late Praxitelean models that were possibly filtered through Western Greek (Tarentine) channels, a route that may be more clearly understood today thanks also to the identification, at Taranto itself, of remains of funerary monuments of certain Greek inspiration. It may

also be possible to link to such a climate some major bronzes discovered in Etruria that are of uncertain function, chronology and attribution. These are wholly isolated, owing to our almost total loss of the great bronze sculpture tradition. They include the Menerva of Arezzo (first half of the third century?) and the so-called Filatrice from the *Fulgur conditum* at the Great Temple of Vulci (an original of the Praxitelean period, a creation of the third–second centuries, or of the Roman age?).

Fig. 57.7: Terracotta fragmentary male statue, from the Scasato I temple, Falerii. Late fourth–beginning of the third century. Rome, Villa Giulia (Photo SAR-Laz)

The splendid architectural terracotta sculptures of the Scasato I cycle at Falerii can satisfactorily be assigned to the dominant Late Classical/Early Hellenistic koine. They must relate to a temple decoration dating to the end of the fourth century–beginning of the third. It is possible to appreciate the great technical and formal refinement of the decorative elements despite the extremely fragmentary nature of the remains—including high reliefs, acroteria, and antefixes—whose overall arrangement escapes us with regard to both its structural function and narrative content. The celebrated bust of the youthful deity—perhaps an oracular Apollo, to whom the temple was

dedicated, inspired by the dynastic portraits that became established at the court of Alexander—is accompanied by statues, whose Praxitelean-Skopadean features (Fig. 57.7) appear to alternate with more Classicistic trends, and by hand-molded antefixes of extraordinary coloristic effect. Today, they provide a valuable reference for the roughly contemporary terracotta decoration of the Temple A recently discovered in the Forum at Cumae. This new archaeological datum is of importance in identifying the main topographical reference points of the international Hellenistic koine to the north of Taranto, between by then Samnitic Campania, Mid-Republican Latium and Etruria.

As the symbolic end to this rapid overview we must place the so-called Capitoline Brutus, dated to around the end of the fourth century—beginning of the third. The vivacious flow of facial features gives this image all the inflections of an honorary portrait. It has an intense spirituality, but no truly individual features; it is a merger of the already consolidated Etruscan capacity of experimenting with non-ideal traits with Late Classical and Early Hellenistic elements of true Greek portraiture, traces of which can be recognized just as much in minor handicrafts as in properly major sculpture (portrait-statue of Demosthenes). Identifying the place where it was produced is rather more difficult, but must be sought—judging from what we have so far examined—in southern Etruria or in the Tiberine district of Latium.

3Painting

The basic problems with defining developments in wall painting—still essentially, if not exclusively, from the Tarquinia area—starting from the mid fifth century draw on the historical motivations indicated for sculpture above. This sector of artistic production also comes to a standstill for monuments related to the second half of the fifth century and resumed in the Late Classical and Early Hellenistic age.

3.1A conservative art

Exacerbating the problems concerning the stylistic and chronological clarity of monuments, especially during the period from the mid fifth century to about the mid fourth, the funerary context—influenced as it was by ritual images and signs—displays a considerable propensity for the persistence of several old figurative themes that celebrate the deceased's social role in life and his destiny in the Netherworld. Thus, tombs of this period, as in the Late Archaic period, continue to emphasize the central importance of scenes of the deceased banqueting, surrounded by dances, music and games in his honor.

Even the style of such scenes appears highly conservative, long preserving a Severe or Proto-Classical, and to a certain extent even ritualistic, imprint—perhaps because it was deemed more suitable to represent a world of traditional values solidly rooted in Etruscan society. Stylistic and thematic updates are clearly not absent, and have only started to be properly assessed in the last few decades, leading to a better, if not conclusive, definition of the chronological sequence of the paintings.

Some tombs at Tarquinia that seem to assimilate innovative hints from the great Greek paintings of Polygnotan lineage can be dated to the second quarter and the central decades of the fifth century. The Tomba del Letto Funebre (Tomb of the Funerary Bed) provides a complex, spatially articulated scene of funerary banquet and games, dominated by a great bed that was perhaps intended to display the deceased or to host rites for a funerary cult of the Dioscuri. The side walls of the Tomba della Nave (Tomb of the Ship), a seascape with a trading vessel of enormously effective realism and perspective, appear to provide an allusion to the deceased's business in life, sublimed in an Elysian banquet that constitutes the focal point of the entire composition and dominates the back wall. Repertorial novelties include individual hunting scenes (e.g. Tomba della Scrofa Nera or Tomb of the Black Sow) that replace the more “choral” compositions of the Archaic period. A few decades later, tombs convey a strong moral exemplum (Tomba del Biclinio or Tomb of the Biclinium) and occasionally portray the ceremonies in honor of the deceased (Tomb Querciola I).

3.2 New Images of the Netherworld

Some of the Tarquinian tombs dating to the second half of the fifth century, such as the Francesca Giustiniani Tomb, the Tomba della Pulcella (Tomb of the Maiden) and the Tomba del Guerriero (Tomb of the Warrior), with their festive processions and the first appearance of winged funerary daemons, constitute a conceptual bridge toward the Tomba dei Demoni Azzurri (Tomb of the Blue Demons), which is now deemed to be the turning point in Tarquinian painting of the Classical period. Indeed, it is in this tomb, which dates to the end of the fifth century—onset of the fourth, that a new system of funerary themes comes to the forefront. This system would be adopted and reproduced with variants in numerous Tarquinian hypogea of the fourth and third centuries. Studies of the various narrative themes of this monument's painting cycle, paralleled by those on contemporary painted funerary vases, have made it possible to identify a Netherworld in Etruscan beliefs of this period. It is a world with well-structured morphological and topographic features, in which the death-daemons have differentiated tasks of supervising and assisting the deceased on their journey to their final destination (**Figure 57.8**). This world does not appear to be oppressed by any pessimistic view, as

maintained on several occasions in the past. The inclusion of daemons, also found in Greek figural art of the same period, seems to be suggested by the overlapping of different elements (popular beliefs, the influences of the theatre) and by the concept of the family hypogeum as the home of several generations of deceased members. That is, the hypogeum was seen as a physical Hades, portrayed with all its legitimate inhabitants and with the creatures that “manage” it—deities and daemons.

In particular, on the left wall of the Tomb of the Blue Demons, the Netherworld is located on the banks of the River Acheron, where the ferryman *Charun* (the Greek demon *Charon*) controls the flow of souls of the deceased, allowing them to join their family members under the vigilant eyes of other custodian and escort daemons. On the opposite wall, a male figure is the protagonist of a triumphal chariot parade, accompanied by musicians and dancers, that seems to be directed toward the Elysian banquet on the back wall, the goal of the deceased at the end of their unequal and varied journeys. The Acheron scene with the ferryman demon appears to be solidly inspired by the iconography depicted on Greek funerary vases of the Classical period. At the same time, it seems to echo the spatial and compositional qualities of lost monumental Hellenic painting, as does the complex hunting scene on the entrance wall (almost totally vanished). The lively plasticity and coloring of the demon figures also gives the impression of a fairly advanced pictorial language. There is no other comparable work from this period, in contrast with the more traditional and still Proto-Classical profiles of figures employed at the banquet and in the triumphal procession. In turn, the latter, though traditional in form, seems innovatory in its commemorative content, and in fact, is the forerunner of depictions of magistrates’ ceremonies frequently found on sarcophagi and, later, in Hellenistic tombs. In short, the whole complex simultaneously provides new themes and episodes of family commemoration that were already rooted in local tradition, such as the banquet on the back wall. It also illustrates rather vividly a profile of aristocratic culture at the time, its figurative codes, and the changes taking place within it.

3.3 In the Beyond, with gods and Greek heroes, accompanied by funerary elogia

The Tomba dell'Orco I (Tomb of the Orcus I) at Tarquinia can be dated to the second quarter, or mid fourth century. With still firmly traditional pictorial language based on outlined design, but in what is now a fully Classical style, its aristocratic owners are portrayed at a funerary banquet in which the Beyond—with its daemons—is indicated in an original fashion by a curtain of black clouds. In the Tomb of the Orcus II, which dates to the third quarter of the fourth century, the Beyond is once again represented as a place wrapped in mists and black clouds, its entrance presided over by the pair of infernal deities, Hades and Persephone. Within its landscape, which is depicted as an infernal marsh, are portrayed heroes and characters of Greek myth—Theseus, *Pirithoos*, *Agamemnon*, *Tiresias* (**Fig. 19.6**)—engaged in sundry narrative contexts. In even greater detail than in the Tomb of the Blue Demons, we are dealing with an ideological plan hinging on Greek literary and figural traditions, in which the commemoration of aristocrats is placed in a catachthonic frame that almost precisely coincides with the tradition of the Odyssean *Nekyia*. The tomb also marks the introduction of innovatory painting techniques, which derive from development in major Greek paintings, with the adoption of a hatched chiaroscuro or with a veil of denser color around the outlines.

Roughly contemporary or slightly earlier is the Tomba degli Scudi (Tomb of the Shields), another great Tarquinian family hypogeum, mentioned in **section 1.6**. Here, the technical procedure is still traditional and does not accomplish much more than to fairly skillfully highlight the outlines and internal details. The painter does show considerable ability in drawing plastic monumental figures and faces with non-ideal features, but they do not reach the level of true portraits. On the compositional side, careful studies of the articulated funerary architecture have made it possible to identify a module-structure centered on the tomb's founder and his father, who is seen engaged in timeless activities in which earthly and infernal dimensions sit side by side and somehow overlap. There is a strong emphasis on the solemnity of banquets and magistrates' processions, and on the inscriptions that give details of the kinship of the protagonists and the *cursus honorum* of the monument's founder.

On a similar stylistic and chronological level are the Orvietan family tombs at Settecamini, which may also have been painted by craftsmen working at Tarquinia. In the Golini Tomb I, the two frescoed zones represent, respectively, the lively preparations for a banquet—with images of a larder

stocked with various meats and a crowd of servants busy in the kitchen—and the Elysian banquet itself, once again taking place in the presence of the gods of the Netherworld. A newly deceased member of the family appears to be making his way to this banquet, portrayed on a chariot and accompanied by a female daemon (*Vanth*). Here too, painted inscriptions contribute to celebrating the memory of the deceased, recording their social rank and the public offices held by members of the *gens* when alive.

Restoration and modern electronic techniques that activate the original colors have made it possible to recover in part the narrative and stylistic legibility of another major Orvietan tomb, the Hescanas Tomb, which can be tentatively dated to the third quarter of the fourth century. Its walls illustrate the journey of the deceased in the Netherworld, from his arrival on a chariot to the triumphal procession, from the meeting with his family members, to his final point of arrival at an altar (?), where a complex initiatory sacrificial scene appears to be taking place.

3.4Funerary and ethical-political commemoration

Of primary importance from a historical as well as pictorial point of view is the François Tomb at Vulci, which dates roughly to the last third of the fourth century, and belonged to the Saties family. Indeed, the frescoes on its central walls (the so-called *atrium* and *tablinum*) narrate episodes of archaic Etruscan history, in which warriors (each of them provided with a painted onomastic-ethnic inscription) of Vulci and from several towns in the Tiber valley hinterland are involved in conflicts that will end in Rome itself. These can probably be identified as the fall of king Tarquinius and the rise of Servius Tullius in the first half of the sixth century. Over two hundred years later in around 330, Vel Saties, the tomb's noble owner, in exhuming these historic events, mirrors them with episodes from Greek myth, which are depicted in the same spaces. The final aim, it seems, is to celebrate the heroic nature of those distant events, and to evoke the certainty that similar splendors will return in the present (different but not less problematic) context. This was a context marked by Rome's strong expansionist drive in the direction of Vulci and central-southern Etruria. On the more properly pictorial side, experiments with chiaroscuro hatching are accompanied by a certain stylistic conservatism in the tomb, which is especially evident in some of the faces (e.g. Nestor, Phoenix). The minor friezes, on the other hand, like the one with a meander in perspective and images of animal fights, reveal familiarity with more recent conquests of Greek and Western Greek painting, achieved by veiling or by points of color and hatching, and indicated by a comparison with Macedonian monuments and Apulian ceramography.

3.5 Other evidence. The new “journey” of Sarteano

The Sarcophagus of the Amazons and the Sarcophagus of the Priest, which were found in aristocratic tombs at Tarquinia, constitute two valuable examples of major funerary painting other than on walls. They date to or shortly after the middle of the fourth century, and are expressions of a composite handicraft tradition, with Greco-Punic, Western Greek and Etruscan features. The two sarcophagi actually have complex paintings on the sides of the box and are thus to some extent, both functionally and ideologically, comparable to a painted tomb. In the Amazonomachy of the former (Fig. 57.9), which is probably based on Western Greek (Tarantine) icono-graphic models, a highly articulated use of color is seen that is aimed at conferring plasticity on the figures. The color is thicker for the orbital cavities and for shaded areas, together with a lightly hatched chiaroscuro and the use of yellow and light blue, with skillfully applied chiaroscuro, which provides a plastic finish to bronze or iron weapons. At the same time, as far as can be deduced from its bad state of preservation, the Amazonomachy of the Sarcophagus of the Priest appears more schematic, with a simplified perspective. The pictorial qualities of the two sarcophagi seem to equate them with tombs such as the François Tomb at Vulci or the Tomb of Orcus II at Tarquinia, whereas the use of mythical battles as Hellenizing images of the rough journey from life to death recalls numerous other contemporary funerary monuments, whether western Greek or Etruscan.

Fig. 57.9: Tarquinia, sarcophagus of the Amazons. Mid-third quarter of the fourth century. Florence, Nat. Archaeol. Mus. (Photo SAT)

Unfortunately, almost totally lost are the wall paintings of public buildings, making it all the more essential to mention the small fragment of a painted terracotta slab from the sanctuary at Celle (Falerii) dedicated to *Juno Curitis*, which shows the profile of a youthful head, the style and graphic conventions of which are wholly similar to Tarquinian and Orvietan tomb frescoes of the mid fourth century.

Besides Tarquinia, Orvieto, and Vulci, painted tombs are also found, for example, at Caere, Blera, Bomarzo, Chiusi, but it is proper to close this chapter on Late Classical painting with the newly found Tomba della Quadriga Infernale (Tomb of the Infernal Quadriga), which was discovered in 2003 at Sarteano, a site of strategic importance for the control of the Val di Chiana and routes to Orvieto and Chiusi. Its paintings, traditional in their layout, and largely lacking chiaroscuro elements, date on a stylistic basis to the last decades of the fourth century and provide evidence of strong links with the tomb painting and still more so with contemporary ceramography of Orvieto. This has led to the hypothesis of the direct involvement of Orvietan craftsmen, who were clearly still active and inventive in this important sector of Etruscan artistic production. The figured scenes, yet again centered on the Netherworld banquet presided over by monstrous creatures (bearded snakes), include a subject otherwise unknown in funerary wall-painting—a red-haired daemon on a wagon drawn by wild and fantastic animals, who, having concluded his journey ferrying souls, starts off once more toward the exit to collect his next load. This novelty may be taken as the metaphorical conclusion of an entire age and an introduction to further developments of what may be termed Hellenistic painting.

Laura Ambrosini

58Handicraft, 450–250 BCE

Abstract: From the mid fifth to the mid third centuries BCE, the middle class aspired to identify itself with the role played by the aristocratic families, which stimulated the production of high quality handicrafts. These included pottery (ancient black-glazed ware with overpainted decoration in “Six’s technique;” red-figure, silvered, yellow slip, polychrome and unglazed relief pottery; black-glazed ware, bronzes (vessels and utensils), jewelry, and glyptic, many of which, intended to be used in life, were buried in tombs.

Keywords: Red-figure pottery, black-glazed pottery, jewelry, glyptic

Introduction

The political and social situation of Etruria from the mid-fifth century to the mid-third century BCE was highly diversified, depending not only on the period, but also on region (see previous chapters)²⁹⁸⁷. During the Late Classical and Hellenistic periods, the re-occupation of the country, which was accompanied by a revival of small and mid-size properties, is evident. The middle class aspired to identify itself with the role played by the old aristocratic families. The middle class became important through production and exchange activities and stimulated the production of high-quality handicrafts,²⁹⁸⁸ including pottery, bronze vessels and utensils, and jewelry, many of which, intended to be used in life, were buried in tombs.

1The Red-figure Pottery

Arnthe Praxias, who was active around 480 BCE, is one of the initiators of the Etruscan overpainting technique, which mimicked red-figure Attic pottery and called “Six’s technique”²⁹⁸⁹. His signature, written in a Chalcidian Greek alphabet, was painted before firing on the rim and handle of an amphora now in Paris. Although it is commonly accepted that he was a metic who used his Greek name as a *gentilicium* to demonstrate his incorporation into civic society and took an Etruscan personal name, he may instead have been the Etruscan son of a Greek immigrant. In the workshop of the Praxias Group, the hands of several painters can be distinguished.²⁹⁹⁰ The style is Sub-Archaic, and in some ways still linked to the Micali Painter. A subsidiary of the

Vulcian workshop of Praxias is the Vagnonville Group²⁹⁹¹ (Fig. 58.1), which was probably active in Chiusi in the third quarter of the fifth century. Apart from some strongly Atticizing large vases made in inland Etruria (Orvieto and Chiusi) even in the fifth century—which are still connected with the black-figure (Orvieto Group) and the Praxias Group—the real red-figure technique seems to have been born at Vulci. The Rodin cup, made in Vulci, seems to date to around 400.²⁹⁹² The external decoration faithfully copies an Attic *kylix* by the Oedipus Painter found at Vulci and an amphora by the Painter of Achilles. Later, there is *Pheziu Paleś* or *Taleś* (now read as *Hezi Utaveś*)²⁹⁹³ on a *kylix* from Grotti (Siena) (Fig. 58.2). The artisan does not have a *gentilicium*, but has only a personal name and a name, maybe, of the father rather than the master. According to Mario Torelli, it is an Attic red-figure *kylix* made in Athens in the workshop of the Penthesilea Painter by an Etruscan slave (440) for the Etruscan market, but according to Mauro Cristofani it is a north Etruscan red-figure *kylix* (similar to the work of the Argonauts Painter) made on Attic model (380–350).²⁹⁹⁴

We must also list the groups gathered around the Stamnos of Bologna 824 and the *kylikes*, which mimic the Attic red-figure *kylikes* with Atticizing style and Lucanian characters. The Painter of Bologna 824 and the Argonauts Painter are connected to the technique of “superposed color” used by the successors of the Vagnonville Group. Around the end of the fifth century the Attic “earlier red-figure” production technique began.²⁹⁹⁵ Recent research has shown that the use of the first productions of Etruscan red-figure pottery in Etruria was intended for middle-upper class people, mostly concentrated in the Tiber valley and in the Val di Chiana, but also in Volterra, in the Apennine area, at Felsina and in the maritime commercial site of Genoa. Recently, Martine Denoyelle²⁹⁹⁶ proposed identifying the Perugia Painter (one of the painters of this early production active at the end of the first decades of the fifth–fourth centuries) with the Lucanian Arnò Painter, who would be transferred to Etruria.²⁹⁹⁷ Fernando Gilotta stressed that these contacts with Lucanian pottery generally involve the Creusa-Dolon Group, the Intermediate Group, and the Primacy Group.²⁹⁹⁸ The vases of the Argonauts Painter are linked with the Protolucanian Amykos Painter (last quarter of the fifth century). The transfer of craftsmen from Magna Graecia to Etruria is probably connected with the foundation of Thurii (444/443). Etruscan and native buyers— and not just urban ones—adhered to especially Attic cultural models, transmitted primarily through Italiot mediation, during the second

half of the fifth century. Faliscan red-figure pottery began to be made in Falerii Veteres around 380–370 with the transfer of Attic artisans to the Ager Faliscus (e.g., the Del Chiaro Painter). This phenomenon has been linked both to the economic crisis that resulted from the Peloponnesian War and to the devastating effects of the plague (430).²⁹⁹⁹ In addition, the arrival of Attic red-figure vases at Falerii Veteres in the first decades of the fourth century³⁰⁰⁰ certainly brought new life to local pottery production. This new life is evident in the iconography, the scenic composition of scenes, the style, and the technique. Around 380 at Falerii Veteres there was a transfer of Greek craftsmen, who began to make red-figure pottery.³⁰⁰¹ The Del Chiaro Painter, founder of workshop A, identified by Benedetta Adembri, was probably a Greek (an Attic painter of the Jena Painter circle), but the next generation of painters was already of local origin. The workshop continued to operate in the following decades with the Nepi Painter and the Diespater Group, who accepted both Attic and Italiot stimuli and adapted them to a very local taste. Two other workshops, B and C, were active and headed by the Painter of Vienna 4008 (370) and the Villa Giulia Painter 8361 (360) respectively. The Painter of London F 484 and the Painter of the Vatican Biga worked in a workshop connected to the Faliscan atelier and to the Lucanian products. Their vases circulated mainly in Vulci. The Campanizing Group³⁰⁰² in the second quarter of the fourth century made vases in southern Etruria and Falerii with a Campanizing/Paestanizing language. The Settecimini Painter worked in inland Etruria (Chiusi or Orvieto), and was inspired by Faliscan painters. The Vanth Painter,³⁰⁰³ who had Faliscan training, produced monumental vases for tombs in his workshop in Orvieto. In the third quarter of the fourth century, the *Clusium* Group³⁰⁰⁴ (Fig. 58.3), created *kylikes*, plastic terra-cotta vases, and small *skyphoi* and disseminated them to Chiusi and the Val di Chiana; while later, around 320 two workshop teachers moved to Volterra and specialized in the production of large column-kraters (*kelebai*) (Fig. 58.4)—which were intended primarily for funerary use—and *stamnoi*. The *tondi* of *kylikes* are decorated with scenes related to Dionysian or erotic themes. This production seems not to have derived—as was previously thought—from a branch of the Faliscan *kylikes* of the mid fourth century, because it was contemporaneous with them. The northern Etruria output had three phases: early (340–330), transitional (330–310), and fully-developed (310–300). The scenes, often with funerary meaning, seem to depict initiation rites and/or the transfer of persons related to the sphere of Dionysus.³⁰⁰⁵ The production of the Alcestis Group and of the Turmuca Group can be located in the Vulci area³⁰⁰⁶. This red-figure pottery is rife with iconographic and symbolic religious meaning, which is also evident in the Funnel Group.³⁰⁰⁷ The Funnel Group (Fig. 58.5), which had been considered Vulcian (possibly with a Tarquinian branch), was recently assigned by Gilotta to craftsmen with Faliscan training. Two famous Fould *stamnoi*,³⁰⁰⁸ one with a Dionysiac scene and the other with stories of Achilles, and a chalice-krater are assigned to the

Hague Painter, the leader of the Frontal Workshop of the Funnel Group, who was active around 300. He was a skilled designer, attentive to spatial effects, chiaroscuro, and anatomy. The Faliscan workshops in the mid-fourth century began making more standardized vases for the middle class, especially *kylikes*, mainly with Dionysian themes—at first, with the relief line (class α , Würzburg 818), and then without (class β , Würzburg 820). The output of the Faliscan workshops in the second half of the fourth century was standardized and of ordinary quality, with figured scenes with erotic or Dionysiac themes (Faliscan Figured Group, 340–280); the Full *Sakkos* Group³⁰⁰⁹, named for the distinctive headgear worn by the women on the vases, and the Barbarano Group, which consists of *oinochoai* decorated with a female head in profile. The Fluid Group is late Faliscan, and takes its name from the appearance of thinned paint on most of the vases.³⁰¹⁰ The style is smooth, rounded, easy, and plenty of water, according to the definition of John Beazley³⁰¹¹. The meander has the “soft” form, with no relief line. The vases are *stamnoi*, amphorae, calyx-kraters, *oinochoai*, *skyphoi*, and so on, and feature the themes of *Nikai*, Dionysos, Maenads, and Satyrs. Caeretan figural production (340–300/280), dependent on the Faliscan, can be identified. In the Caeretan Figured Group, the oldest painter—and one of the most prolific—was the Villa Giulia Caeretan Painter, who was probably still working at Falerii, in the Faliscan-Caeretan style), and later moved to Caere (Caeretan old, middle, and recent styles).³⁰¹² The Torcop Group³⁰¹³ of the second half of the fourth to the early third century is named for the vases in the museums of Toronto and Copenhagen. The vases are *oinochoai* decorated with women’s faces in profile (two on the body and one on the neck). Mario Del Chiaro suggests Caere as the location of production, and dates it to between the second half of the fourth and the early third century. The Torcop Group was much more widely distributed than the Caeretan figured vases, including to coastal Etruria and the Faliscan and Latin areas.³⁰¹⁴ In this period, the *Genucilia* plates were a very widespread pottery class; Del Chiaro’s study is still fundamental.³⁰¹⁵ The eponymous plate in Providence, Rhode Island (USA), which might have been purchased at Falerii Veteres, has the name *Poplia Genucilia* painted below the foot. The first name is typical of the Faliscan area;³⁰¹⁶ the *gentilicium* is attested in the nearby countryside Ager Capenas at Lucus Feroniae. The production began at Falerii Veteres in the third quarter of the fourth century (350–325) and then continued in Caere. The plates are decorated with a female head (in both the Faliscan and the Caeretan versions) or with a star (in the Caeretan). But there were also local products.³⁰¹⁷ Coin-devices and shield’s episemata, according to Torelli, inspired the decoration of the plates. The *Genucilia* plates were popular in tombs, votive deposits, buildings related to worship, and the sanctuaries of Latium and Etruria. According to Torelli the main function of the *Genucilia* plates was ceremonial—to receive symbolic (or not) parts of food during the public (such as the hecatombs to Hercules) or private feasts in homes for the cult of the dead in

the graves or of Lares. The silvered³⁰¹⁸ (Fig. 58.6), yellow slip, polychrome, and unglazed relief pottery was created with the aim of mimicking metal prototypes. Volsinian, Faliscan, and Volterranean products have been identified. Their contacts with Apulia and Macedonia are noteworthy. For example, *oinochoe* shape VI is borrowed from Macedonian specimens (Stauropolis, Derveni, Arzos, and Vergina)³⁰¹⁹. In the repertoire there are many scenes of Amazons, derived from the decoration of the Mausoleum of Halicarnassus and revised and distributed through cartoons in the Etruscan and Italian areas. There are the labors of Herakles—which are also found in Greece and Magna Graecia on mirror cases and helmets.³⁰²⁰ In the second half of the fourth century, black-glazed ware with overpainted decoration, which initially mimicked Attic red-figure ware, spread³⁰²¹. During the fourth century, the presence of Greek metics (probably from Campania) is attested by the signature *Sokra(tes)* on a overpainted vase of the mid fourth century from Falerii Veteres, head of a large production for the middle classes (Sokra Group).³⁰²² The Phantom Group was started by a Faliscan artist who emigrated to Caere (Jolivet) or to Tarquinia (Pianu) at the time of the war of 358–351, in which Tarquinia and Falerii Veteres were allied against Rome.³⁰²³ Stefano Bruni suggests a greater articulation of production in several sites (one probably in Latium).³⁰²⁴ Bruni's hypothesis, pending confirmation, would even make it likely that this group was widely distributed in southern Latium and Rome itself. This group is connected to the Ferrara T 585 Southern Group or the Palmetta Southern Group³⁰²⁵ (late fourth or early third century), which includes *skyphoi* with white triangular palmettes within a metope. The technical characteristics of the Saint Valentin Group³⁰²⁶ vases and of the imitation of Gnathia Style³⁰²⁷ vases seem to refer back to southern Etruria, especially to Tarquinia. Many features demonstrate the transmission of technical know-how that took place through direct contact between craftsmen, perhaps by Apulian artisans who moved from Apulia to Etruria.³⁰²⁸ For that period, the problem has especially been discussed in relation to the creation of the *Pocula deorum*.³⁰²⁹ Dated to between the late fourth and the early decades of the third century, these are a small number of vases with overpainted inscriptions and—almost always—overpainted decorations, which were influenced by Apulian vase painting and connected to the vases produced by the *Atelier des Petites Estampilles*. The figure of Eros predominates, enriched with acclamations in Latin of many deities, which include some of those for whom cults were introduced in Rome between 303 and 291, such as Salus, Bellona, Venus, and Aesculapius. Cristofani thought that the production of *Pocula deorum* was related to the transfer of Vulcian artisans to Rome after the Roman conquest of Vulci in 280. The Hesse Group (300–280) is connected with the *Pocula deorum* in its painting technique of painting. The vases of the Group, which are tentatively attributed to Vulci, have overpainted decoration, but the style is more properly Etruscan. They have close contacts with the Gnathia pottery of Taranto,

although the quality of the Apulian vases is much higher. Etruscan figural pottery was superseded by black-glazed ware,³⁰³⁰ which thereafter was destined to predominate not only in Etruria, but also in the Mediterranean basin.

2Bronze vessels and utensils

*Candelabra*³⁰³¹ continued to be made until the second half of the fourth century, although southern Etruria seems to have been more engaged in the production of *thymiateria* of the tripod type (Vulcian, Faliscan, Volsinian, and Todi versions) and the portable type (the “*Curunas* type” from Tarquinia) (Fig. 58.7).³⁰³² The *candelabra*, made of bronze, was a luxury item for the wealthy classes, while the vast majority of the population used tallow candles, pitch or torches. The large bronze “lamp” with multiple noozles from Cortona,³⁰³³ an object of exceptional size, was evidently intended to be exposed in a sanctuary, as was the more recent find in the sanctuary of Fucoli in Chianciano.³⁰³⁴ More modest lamps have been found in the hypogeum of

the *Volumni*³⁰³⁵. During the Archaic period, Vulci had dominated bronze production in southern Etruria, but Orvieto took part as well. Orvieto is also believed to have manufactured various vases, tools, and mirrors. Relief mirrors were also made at Vulci.³⁰³⁶ Mirrors seem to have been made at Volsinii³⁰³⁷ around the late fifth century,³⁰³⁸ which show scenes that are directly dependent on the Attic red-figure vases of the third and fourth quarter of the fifth century. This continued during the first half of the fourth century with the San Francisco Group. Data relating to the discovery of the mirrors of this group seem to orient the location of the workshop to Orvieto, with circulation in coastal and southern Etruria, through the Tiber Valley, and to northern and inland Etruria.³⁰³⁹ As for mirrors from Perugia, Marisa Bonamici has demonstrated that workers transferred from Latium to revitalize an existing local tradition. These mirrors exhibit iconographic motifs of Paestan or Italiot origin, perhaps by way of Palestrina, because they are similar to those attested in the production of Praenestine cysts and Etruscan red-figure pottery.³⁰⁴⁰ In Etruria, circular mirrors³⁰⁴¹ with tang cast in one piece with the disk, for attaching a handle of a different material (ivory or especially bone), continued to be made until the end of the fourth/beginning of the third century. This type of mirror, with one, two, or three figures was still being made in the second half of the fourth century.³⁰⁴² The disks are normally thinner and the concavity of the reverse becomes slightly more pronounced. At that time began the production of mirrors with the disk cast in one piece with the handle (Fr. “miroir a manche massif”). The handles regularly terminate in an animal head, either a ram or a deer. In the late mirrors, the disks are smaller in diameter but have a strongly curved profile and thickened rim. In the *Lasa* Mirror Group,³⁰⁴³ the name is often conventionally applied to a nude female winged figure, a spirit associated with adornment or anointment. Tang mirrors (type A Wiman) do not appear after the first half of the third century. The chronological limit for the late *Lasa* mirrors of the tang type, indicated by the context of the finds, is the end of the fourth/beginning of the third century. Study of their contexts years ago showed that the tombs in southern Etruria in which *Lasa* mirrors of the cast-handle type (type B: 1–2–3 Wiman) (Fig. 58.8) were found dated to the beginning of the third and the mid second century, those in Picenum (Ager Gallicus) to the second half of the third century and those in northern Etruria to the first half of the second century.³⁰⁴⁴ The subsequent publication by Gabriele Cateni of Volterranean funerary contexts containing a mirror and some datable objects such as coins (given the controversial dating of “the “weight reductions” of the coins), seems to have generally confirmed the chronology proposed for *Lasa* mirrors in northern Etruria.³⁰⁴⁵ The dating of the Dioskouroi Group, with images of the Dioskouroi facing each other, is also controversial. The same is true of the localization of their centers of manufacture, because these mirrors have been found at a wide range of sites in Etruria. Most scholars support the assignment of the *Kranzspiegelgruppe* to

Volsinii (or Chiusi).³⁰⁴⁶ They date from the second half of the fourth century for the best mirrors, to the third century, with some even in the second century (according to some scholars). A recent study stressed that the earliest mirrors of the *Kranzspiegelgruppe*, which have been found in funerary contexts dating from the late fourth and early third centuries, were intended for aristocratic families living in the Volsinian countryside. The problem is certainly more complex for the most recent mirrors of the same type, with schematic scenes. There were more workshops, in both southern and northern Etruria, as the distribution of the mirrors shows.³⁰⁴⁷ In Etruria, as in Magna Graecia and Macedonia, the use of the mirror case (Ger. *Klappspiegel*) spread at this time.³⁰⁴⁸ The mirror case, which was invented at the end of the fifth century in workshops in Athens, Corinth, and Chalcis, was found in Etruria from the end of the fourth century and was widespread in the third in Tarquinia, Vulci, Tuscania, Caere, Elba, and elsewhere. There are also many representations of hinged boxes for mirrors on Volterranean urns. Especially in northern Etruria, from the third to the first century the mirror could be placed in the depression carved inside the wooden clamshell box. Bronze vessels³⁰⁴⁹ from the second half of the fifth to the fourth century were well shaped for the symposium, and intended for the middle class. The decline of the symposium as an institution, however, led to a reduction in the variety of vase shapes (the shapes seem to be more widely linked to eating a meal, than to drinking wine). As shown below, this phenomenon is connected to the imitation of metal vessels with silver or black-painted pottery (especially the Malacena made in Volterra). Among the vases is the bronze flask of the first Cianferoni type, which was made in Chiusi between the second half of the third and the early second century. These artifacts spread not only to Clusium and the surrounding territory, but as far as southern and northern—and including coastal—Etruria, the land of the Umbrians (Spello), and the Gallic sites of Picenum (Montefortino of Arcevia). The decorative elements of this type of flask are common on the precious vessels of the Hellenistic period from Dacia, Boeotia, Bithynia, and Magna Grecia.³⁰⁵⁰ Even in metal vessels, the Amazonomachy is the predominant theme.³⁰⁵¹

3Jewelry

Specific laws in Archaic Greece and Rome gradually limited the use of gold in the private sphere, transferring it to the public sphere and to sanctuary treasures. During the fifth century there was self-regulation as to the exhibition of luxury during the funeral in sites in southern (especially Tyrrhenian) Etruria, perhaps under the influence of Roman laws. Jewels are less numerous; they are more plentiful in the cities of the inland Etruria. Many such precious jewels are also depicted on clay votive statues (such as the very

famous example from Lavinium), tomb paintings, bronze statuettes, mirrors, and so on.³⁰⁵²

Fig. 58.9: Gold leaf crown from Volterra, Portone necropolis. Volterra, Museo Etrusco Guarnacci, inv. no. 4 (Photo SAT)

Diadems

From the late fifth century, diadems decorated with embossed ends (for example, the peacock, a symbol of death and rebirth that was perhaps connected to Dionysus, as well as the Silenus mask) were used. The crowns (Fig. 58.9)—which are particularly evidenced in Volterra, Vulci, and Chiusi—seem to end at the end of the third century.³⁰⁵³ The scope of this ideological ornamentation may be related to the military sphere, and are perhaps connected with triumphal ceremonies and worship (the Orphic religion). Some differences in iconography and techniques allow identification of Etruscan make and distinction from that of Magna Graecia. The crowns from the Greek peripheral world—and in particular the Black Sea colonies and Macedonia—do not seem to be typologically related to the Etruscan ones. It seems that in Etruria funerary use of the metal crown was usually connected to beliefs of the Dionysian type or to other mysteries.³⁰⁵⁴

Earrings

The *a grappolo* earring type circulated in Etruria during the Late Classical and Early Hellenistic periods. A recent study confirms that the *a grappolo* earring type was purely an Etruscan creation with no close Greek predecessor.³⁰⁵⁵ The contexts of the finds show that this type of earring appeared by the second or third quarter of the fifth century, and was used until the end of the fourth/beginning of the third. The tube earring, which seems to stem from older forms such as cornet earrings, seems especially prevalent in northern Etruria. These examples are widespread, being found at Vulci, Pyrgi, Volterra and the surrounding area, Bettona, and Volsinii. The use of earrings with lion

heads (such as from Caere and Volterra) relates to Macedonia and arrived in Etruria in the late fourth century by way of the Taranto area. In Etruria were found not only earrings made in Magna Graecia (mostly in Taranto, such as those from the François Tomb in Vulci),³⁰⁵⁶ but even earrings depicting the heads of African people (in amber instead of garnet)³⁰⁵⁷ (Fig. 58.10), which, while using Taranto models, are likely Etruscan-made. Other earrings of a Magna Graecia type, found in Apulia, were imitated in Etruria, including those with figured pending, little bells, amphoras, or glass paste birds. In Vulci have been found earrings type V b Schojer, with a pendant of a bunch of grapes (or a variant with glazed grapes hanging from the disk), dated at the end of the third or the early second century, and earrings of type II D Schojer with disc and triple glass paste pendant in the shape of a bird. At both Vulci and at Chiusi, earrings of type II D Schojer with disc and triple pendant with a glass paste bird have been found. Ettore Maria De Juliis believes that buttons depicting the head of Medusa—characteristic of a Taranto workshop—found in Tomb 1 of Peschiera in Todi,³⁰⁵⁸ are gold foil studs for clothes or belts. *Pelta* earrings and *disco* earrings with inverted pyramid, which concisely reproduces types that were common in Taranto in the fifth and fourth centuries, are also attested between the third and second centuries.

Fig. 58.10: Gold earrings with head of an African from Riparbella, Volterra. Volterra, Museo Etrusco Guarnacci, inv. no. 91 (Photo SAT)

Rings, necklaces and bullae

As for rings, there is the Fortnum Group, named for a collector³⁰⁵⁹. Devised in the late fifth century but only becoming popular in the fourth, these rings have an almond-shaped bezel, with heroic episodes and love scenes. Between the Classical and Early Hellenistic ages, eye-shaped rings are common: they

have a large oval relief bezel of obvious apotropaic significance, decorated with beads, animal (lions or dolphins, for example) or plant matter images. In both rings and necklaces, the Heraklean knot—which signified luck—is attested from the fourth century. Disk-shaped *bullae*³⁰⁶⁰ in necklaces with pendants, decorated with embossed ornaments, were typically worn by boys, but were also part of women's outfits. *Bullae* with a talismanic value have mythological subjects that are generally connected to the sphere or have apotropaic significance. Mythical characters were taken as a model of ethical reference behavior. The single *bulla* has been interpreted as an attribute of the *puer ingenuus*, to connote a particular *status*, but, according to Alessandra Coen, it is related to some aspects of Dionysian (like the necklaces with multiple *bullae*, which were worn by women). There was certainly a workshop for *bullae* and diadems in Clusium. The jewels found in Picenum, ascribed mainly to Vulci,³⁰⁶¹ show that the path from Vulci through the Tiber area to the towns of Umbria and the Picenum was still active. The Macedonian taste for the *lonchia* necklace (with thick lanceolate pendants) spread beginning in the last decades of the fourth century.

4Glyptic

There is clearly a decline in Etruscan inscriptions on scarabs, which peaked during the period of the Severe style³⁰⁶². Peter Zazoff suggests that the southern Etruscan carving workshops were at Caere or Vulci, while Marina Martelli suggests that they were at Tarquinia. Martelli considers this location most plausible because it is supported not only by the style and distribution of the scarabs, but also by the paleographic characteristics of the inscriptions that accompany the images. From the mid to the late fifth century, the glyptic passed through the “Middle” style, from the “Severe” style to the “Free” style, with softer shapes. The style at the end of the fifth century was close to the Greek model because the figures moved more freely in space. Most of the figures seem selected from and linked to Etruscan religion, with all that is connected to it, including the sacrifices, divination, and otherworldly beliefs. The *a globolo* scarabs constitute a large and distinctive group of Etrusco-Italic intaglios. Their engraved devices (human and animal figures) consist of a limited number of round cavities achieved by using the spherical drill and the disk-shaped drill. The name refers to the technique by which the figures are composed. The contexts of finds indicate a wider social stratification among owners of gems probably used as seal than was previously attested.³⁰⁶³ They come from Etruria, Campania, Apulia, and the islands, and, outside Italy, the wider Mediterranean and Black Sea areas. The datable contexts clearly show that, though they began to be made in the late fifth century, the majority of items were deposited after the mid fourth century and no later than the early

decades of the third. The peak of production was during the years 325–275, or about two generations. Ulf Hansson believes that some motifs that are less commonly attested in Etruscan culture, and which have been incorporated into the repertory of the *globolo* gemseals, are Latin and South Italian influences.³⁰⁶⁴ The end of Etruscan gem production is difficult to pinpoint. The Etruscan workshop may have continued to produce ringstones (gems intended to be set into metal finger-rings). The ringstones vary in shape from circular to oval or more angular, and depict figures from the Greek myth or anonymous male or female figures, few with inscriptions written in Latin letters. Between the third and the second centuries ringstone workshops seem to have been created in central and southern Italy. The influence of Etruscan engravers seems to be active on later Italic and Roman-Republican workshops.

5Conclusions

In the Hellenistic Etruria various production centers were engaged in the creation of artistic objects for the upper middle class. This class, thanks to the economic and social transformation, often participated to the political government of the cities and wants to regain possession of the status symbols of the oligarchic class. The future economical development will see a more standardized production for a greater number of people. Slave activity in the workshops become more intense.

Abstract: The economic crisis of the southern Etruscan coastal metropolises in the second half of the fifth century BCE, whose social consequences are unfortunately little known to us, appears to have been overcome by a systematic reorganization of the territory at the beginning of the fourth century. The previously broader urban upper class developed into an increasingly elitist oligarchy of the nobility, in which a few gentes, strategically scattered across the territory, set the political and social tone. This circumstance was characteristic for all of Etruria and persisted until the merger into the Roman state, which promoted the *status quo* in its own interests. Large-scale landholdings now once again functioned as the economic basis of the nobility; ancestor cults, outward representation, and exhibitions of luxury were integral patterns of behavior of these elites.

Contrasting with them, especially in the larger and smaller urban centers, were large parts of the population who we shall call the free middle classes. The epigraphic and archaeological evidence from the funerary realm reveal their existence. This is true for cities in inner Etruria like Chiusi and Perugia (with their many funerary inscriptions of Etruscan citizens) as well as for coastal Tarquinia. Their rights were not equal to those of the *principes*. Transition to the lower class, the urban proletariat, was probably also fluid in Etruria. It seems that free men in rural northern Etruria could be small landowners, while in the south, beginning in the third century, they were adversely affected by large-scale Roman land confiscations. Although it is continually suggested in both older and newer research, there exists no concrete evidence of “half-free” classes of population. Client-patron relationships created a moderate balance of interests that lay in private rather than state hands. Slaveholding increased sharply in the Late Etruscan period; slaves worked in the fields of the large landowners, in manufacturing, in the metal industries (e.g. Populonia), and in private households. In contrast to Rome, most freedmen did not immediately achieve citizenship; as a rule only their descendants were entitled to it. Social tensions could lead to open revolts (e.g., in Arretium, Volsinii veteres); but the unclear terminology of the ancient authors and the indubitably broad front of discriminated persons strongly hinder a deeper understanding of these events.

The tendencies toward social liberalization typical of the Hellenistic period are also perceptible in Etruria; the weakening of the rigid Archaic family structures brought the female element more freedom (e.g. matrimonial law). The epigraphic documentation of women is now more substantial than in the sixth and fifth centuries—especially in funerary inscriptions, but also in dedicatory ones— but clearly remains less substantial than that of men. In the aristocratic environment, proud female figures made their appearance along the lines of Roman matrons; they played an important role as a means of alliance between the great *gentes*, but always against the background of basic inequality of rights.

Keywords: oligarchy, middle class, freedmen, social revolts, female element

1Crisis in the south and resurgence of the nobility

Archaeology tells us that beginning in the middle of the fifth century BCE,

large parts of southern Etruria (and Rome as well) began to slip into an economic and cultural crisis,³⁰⁶⁵ although this was less true for the interior and the more northerly regions (e.g. Volsinii veteres, Populonia, Pisa).³⁰⁶⁶ The reasons for this decline were probably complex; alongside foreign misadventures against the Greeks, domestic tensions, whose exact nature remains to be clarified by future research, must have been highly significant. The migratory movements of central Italic tribes, which had a considerable impact on the overland trading routes heading south (Aequi, Volsci, Hernici) and ultimately led to the loss of the Campanian colonies (Samnites/Campanians), contributed to the intensification of the situation. The fact is, a reorientation of the market in the direction of the eastern Po plain (with its important ports of Spina and Adria) set in at the middle of the century. It is probable that the economic recession in the southern coastal centers must have especially strongly hit the urban middle classes, whose members earned their living as traders and craftsmen. Unfortunately, we know very little of the social impact of these developments.

Overall, the southern Etruscan city-states were strong enough to overcome this temporary crisis by the beginning of the fourth century. They did so by means of a deliberate reorganization of their territory, as can be shown particularly in the case of Tarquinia, where modern research likes to speak of an “internal colonization” with the activation or reactivation of the smaller centers (such as Tuscania, Castel d’Asso, Norchia, Musarna, and Ferento).³⁰⁶⁷ Major port settlements such as Pyrgi had in fact lost their international character, but in the early fourth century again became tempting targets for looters, as shown by the raid that took place in 384, in which the Syracusans seized rich booty and many prisoners (Diod. Sic. 15.14.3; Strabo 5.226).

The driving force of this reorganization of the territory was the urban upper class of the respective urban centers, or more precisely only some of it, and in fact probably only those families who were landowners or in a position to acquire land. For, beginning in the fourth century, a situation appears throughout Etruria that can be described as an increasingly elitist oligarchy of the nobility. At the same time, a parallel (re)evaluation of the gentile structures took place, so that the end result was a few large *gentes*—strategically spread across the territory and probably with a considerable entourage—setting the political and social tone in the various city-states of Etruria. They include, among others, the Spurinna in Tarquinia, the Satie in Vulci, the Leinie in Volsinii, the Velimna (Volumnii) in Perugia, the Cilnie (Cilnii) in Arretium (one of them was the friend and political companion of Augustus, C. Cilnius Maecenas), and the Caicna (Caecina) in Volterra.³⁰⁶⁸ This situation remained essentially intact until the final incorporation of Etruria into the Roman world in 90 BCE. No longer relevant to Late Etruscan development was Veii, only 17 km distant from Rome, which already in 396 (respectively 388) fell to its old rival (Livy 5.19–22; Diod. Sic. 14.93.2). Rome enslaved a large part of Veii’s population and incorporated the

conquered territory, and through individual land appropriations divided it among its own people, which helped to relieve the social pressure in the emerging settlement on the Tiber.

The major Etruscan *gentes* had branches in the smaller centers of the territory and are recurrently cited in the local magistratal inscriptions (such as the Tarquinian *gens* Alethna in Musarna and the *gens* Curuna in Tuscania).³⁰⁶⁹ The custom of the *cursus honorum* is documented considerably more clearly in southern Etruria than in the northern part of the land. Alliances by marriage within and outside of their own spheres of influence furthered internal solidarity between these *gentes* (social endogamy).³⁰⁷⁰ Especially revealing is the funerary epigram of Larthi Cilnei, which presumably comes from one of the necropolises of Tarquinia and probably belongs to the early third century BCE.³⁰⁷¹ The text confirms marriage contacts between two politically eminent families, the Cilnii of Arretium and the *gens* Spurinna of Tarquinia. These can more easily be categorized because, thanks to the *Elogia Tarquiniensia*, we know of Tarquinia's (not precisely datable) political-military assistance, under the command of a certain Aule Spurinna, of the aristocratic elite of Arretium.³⁰⁷² Naturally there will also have been internal power struggles within the local aristocracies, which—as is sometimes suggested—in the case of Chiusi might have provoked the invasion of Celtic groups.³⁰⁷³

In order to legitimize their own position of power, the leading families now again strongly sought connection to the ancestors and their merits. This tendency found its ideal expression in the fourth century in the painted “banquet of the ancestors”, typical of some Early Hellenistic chamber tombs of the nobility. This unites the deceased of a *gens*—including also the wives—in the hereafter, sometimes in the presence of the ruling couple of the underworld. Prominent examples are the wall paintings in the Tomba dell'Orco (Tomb of the Orcus) and the Tomba degli Scudi (Tomb of the Shields) in Tarquinia, the Golini Tombs I—II and the Hescana Tomb in Orvieto, and the Tomb of the Triclinium in Caere.³⁰⁷⁴ In parallel, beginning in the fourth century, extensive tomb complexes known as gentilic tombs, with one large room or several smaller chambers, were developed for receiving numerous interments from one *gens*. With varying local manifestations, this type is found throughout Etruria. Some of the *gentes* must have been considerably ramified, so that the individual branches of a family group could have held social positions that differed in detail.

Beginning in the late fourth century, the tomb and especially its facade took on increased significance as a place for representation to the outer world. Clear tendencies toward the “heroization” of the tomb's owner can be recognized in the Late Etruscan rock-facade tombs, which are strongly oriented to Greek architectural models (e.g. temple tombs in Norchia and Sovana; *aedicula* [small shrine] tombs in Sovana with emphasis on the tomb's owner banqueting in the hereafter).³⁰⁷⁵ The material wealth of the *principes*, which to a considerable extent relied on the possession of a large amount of

agricultural land, was expressed moreover in a luxurious lifestyle in lordly manors with extensive staffing. Moralizing ancient Greek authors were quite disposed to pin on the Etruscans—and on other barbarian peoples with highly hierarchical structures as well—the label of *tryphé*, which was defined by excessive luxury at the table, exaggerated good living, and decadence. This holds even for the well-informed Posidonius, whose well-known passage on Late Etruscan society also relies on other, Etruscan-friendly sources and emphasizes various cultural achievements of this people (including signs of public authority, the type of the atrium house, and the adoption of writing) (*apud* Diod. Sic. 5.40). For the philosopher, the moral decay of the Late Etruscan upper class brought about by the agricultural surplus served as a silent warning to Rome.³⁰⁷⁶ That the clothing of the house slaves in attendance corresponded to the high status and the striving for representation of their masters should not be overinterpreted.

2The middle and lower classes

Alongside the upper class, the cities housed a broad, heterogeneous middle class with presumably fluid boundaries to the lower segment of the population, which had basically no possessions of its own. The regular city plan of the settlements like Musarna appears to reflect this broad middle class.³⁰⁷⁷ Non-state, privately based client-patron relationships provided a moderate balance of interests; the smaller tombs, such as those grouped around the central chamber tomb of the aristocratic *gens* Anina in Tarquinia (Fondo Scataglini; late fourth-first century), should probably be interpreted in this sense.³⁰⁷⁸

Regarding the access of the middle-class population element to permanent forms of burial, there were regional differences in Etruria. Especially in the inner Etruscan cities of Perugia and Chiusi, beginning in the third century, their deposition in less extravagant and increasingly standardized ash urns is strikingly high.³⁰⁷⁹ The numerous inscriptions show that these persons were citizens. This is undoubtedly a sign of an improvement in the standard of living in broader parts of the population. From the late third century onwards the general trend toward simpler forms of burial containers—in contrast with southern Etruria—did not fail to leave its mark among the Chiusian aristocracy as well. Regulating norms of a civil or religious nature are assumed, but the existence of an aristocracy is not to be doubted.³⁰⁸⁰ Little rural landholdings appear to have been a possibility for earning one's living in the inner and northern parts of the country (Chiusi, Perugia, Cortona, Volterra). Alongside the archaeological evidence, the Tabula Cortonensis, discovered in 1992 near Cortona, which belongs to the late third-early second century, is of interest in this regard.³⁰⁸¹ It seems to be a sort of evidentiary

document for the purchase of estates. A fairly large number of persons with Etruscan citizenship, but of different social status, are enumerated, among them probably—although the interpretations of the document differ in detail—smallholders (and/or free tenants).

Little known are the urban middle classes in the Late Etruscan south. The many simple chamber tombs found at Tarquinia have, in contrast to the *hypogaea* (underground tombs) of the nobility, no figural wall paintings, but in the Hellenistic period sometimes exhibit painted inscriptions.³⁰⁸² Yet altogether, the epigraphic remains of the middle classes in the south are considerably thinner than in the inner parts of northern Etruria. Also to be assigned to this segment are the less prestigious fourth- and third-century tomb complexes in the smaller urban centers in the southern Etruscan rock tomb area (e.g. Castel d'Asso).³⁰⁸³

In the second half of the fourth century, the conflicts with expansion-hungry Rome increased (according to the tradition Caere appears to have been closely linked with Rome, as among other evidence the Tomb of the Clavtie/Claudii suggests³⁰⁸⁴). The final outcome was the permanent subjection of Etruria, at the latest in the second quarter of the third century. Its city-states became Roman allies with the obligation to military service.³⁰⁸⁵ Whereas the more distant north did not fall among the direct territorial interests of Rome and profited economically, in the first half of the third century the Etruscan south had to put up with extensive territorial annexations. It was presumably mainly the local nobility that managed to repossess the available *ager publicus* for agricultural purposes. The long-term losers in these developments were more likely the mid-sized and especially small landowners of southern Etruria. Unfortunately, no basic study of social relationships in the rural and urban area of southern Etruria between the fourth and second centuries has yet been done.

As for craft production, beginning in the third century there is a noticeably stronger trend toward mass production (ceramics, votive statues, mirrors, etc.), and, as a result, a clear increase in larger establishments. In 'industrial' cities such as Arretium, which provided a large amount of weaponry for Scipio's African campaign of 205 (Livy 28.45.16–17), beginning in the third century there must have been a fairly high pool of cheap labor, whether slave or freeborn. Naturally this 'mass' production—which was also exported, but in good measure remained in the land itself—on the other side presupposes a corresponding buyers potential, which in turn points to a broad middle class.

The Roman literary tradition wavers between *plebs* and—more commonly—*servi* to describe the lower classes, generally having in mind the existence of a dependency relationship. The Greek sources, however, only very rarely use the Classical Greek word for slave, *doûlos* (as a rule in Greek consciousness referring to a foreigner); instead they speak of "household servants" (*oikétai*) and "servants" (*therápontes*). The term *penéstai* is used only once, in Dionysius of Halicarnassus (9.5.4), to describe the Etruscan

troops in the war between Veii and Rome in 480 (cf. chapters 53 Amann, 65 Marcone). Although both older and modern literature relies on this passage again and again,³⁰⁸⁶ it is not evidence for the existence of a class of half-free persons in Etruria along the lines of the *penéstai* of Thessaly or the helots of Messenia.³⁰⁸⁷ As Enrico Benelli rightly insists, in this context it was merely a designation for a group of persons dependent on the ruling upper class, without reference to their concrete legal status.³⁰⁸⁸ It is reasonable to recognize client relationships that cannot be more closely described, but must have been normal in the ancient world. The parallel version in Livy is marked by the Roman Conflict of the Orders, whose excesses would have been used as an advantage in the war by the Etruscan *principes* (cf. 2.44.7–12). Livy (9.36.12) knows of emergency troops among the rural population, who were promptly invoked by the noble lords in 310 in order to face the Roman army that had surprisingly invaded the country. This appears to be a sort of rural Etruscan *plebs*. In this context, there has been much discussion about the meaning of the term *etera* (or *lautn eteri*), epigraphically attested several times in the Late Etruscan period, which appears in connection with personal names (usually with *praenomen* and *nomen gentile*).³⁰⁸⁹ It is neither the Etruscan designation for the slave or the “half free” nor, probably, for the client.³⁰⁹⁰ There were (state or religious?) offices like the *zilath eterau* and *zileteraia* (Tarquinia, Musarna, Vulci, Orvieto) and the *camθi eterau* (Tarquinia), whose holders came from the upper class. Since in some cases the holder of the title is quite young, it has been thought that the office of the *zilath eterau* meant some sort of youth organization under a—likewise youthful—*praetor iuventutis*.³⁰⁹¹ But this interpretation too is problematic; hence Benelli’s latest proposal to understand the term not in relation to the person, but to the tomb or the burial, constitutes an interesting alternative.³⁰⁹² What remains certain is that the word can in no way be cited as evidence for the existence of Etruscan “half-free” persons.

In any case, the steadily increasing groups of slaves included foreigners, who (through abduction, war, etc.) were deprived of their human rights or held the status of a slave from birth. This last possibility must have drastically increased in the Hellenistic period. Whether debt slavery was lessened for Etruscans, or—as in Rome—might have been abolished for full citizens, is just as unknown as the Etruscan term for “unfree” (respectively the enslaved person). The name formula consisted of the individual name of the slave, to which the owner’s *nomen gentile* was added in the genitive.³⁰⁹³ Naturally, names of slaves are rarely documented, and moreover the ambivalent formula often leads to hermeneutic uncertainties. Interesting name material in this regard can be found in the few Late Etruscan chamber tombs nearby Orvieto, which accommodate the members of a small oligarchic circle. Of note, for example, is the *petinate hescanas* in the Tomb of the Hescana in Porano (*ET*² Vs 7.38); of special interest, however, is the problematic Golini Tomb I near Settecaminì. This tomb of the Leinie *gens* shows the banqueting nobility (with

long inscriptions) in the presence of the ruling couple of the Underworld and the activities of the servants in the kitchen physically separated from the banquet of the nobles by a partition.³⁰⁹⁴ The short labels on the servant figures are morphologically heterogeneous; alongside appellatives that less resemble personal names than a description of individual duties (e.g. *tesinθ tamiaθuras*, *ET² Vs 7.9*) are found binomial names that are hard to interpret in view of the concrete social status of their bearers—*runxlvis papnas* and *θresu penznas*, for example, could be slaves (who belonged to other families?).³⁰⁹⁵ In theory, the hiring of a “catering staff” with both free and non-free workers for upper-class banquets (as known from the comedies) is also a possibility.

The fate and living conditions of slaves depended, as elsewhere, on their use. Hard physical labor was performed by work-slaves in the fields of large landowners, in the factories, mines, and generally in the area of metalworking (Accesa, Populonia). Among house slaves there were certainly grades. Valuable slaves, their lack of freedom aside, were accustomed to a higher lifestyle than that of the Etruscan proletariat and belonged among the equipment of lordly representation (as shown by the servant figures in the tomb paintings). Unprovable, but quite likely, is the *peculium* of slaves known from Rome.

The existence of some sort of setting free (manumission) is certain, although its procedures and legal extent remain in the dark. The outcome was that the *lautni* (m.)/*lautniθα* (f.) achieved his/her personal freedom but definitely remained closely bound to the patron (hence *lautni* = “the one who belongs to the family”).³⁰⁹⁶ Full equality and political integration into the state—which in the name formula is made clear by a *praenomen* and a *nomen gentile* of their own—was as a rule achieved only by their descendants, whose *nomen gentile* was formed from the individual name of the (freed) father. Yet the quite numerous *lautni* inscriptions—which with a few exceptions (including one from the Late Archaic period) mostly come from Late Etruscan northern and inner Etruria—exhibit a certain degree of fluctuation in the formula.³⁰⁹⁷ Alongside Etruscan names, many foreign individual names are found that indicate the origin of the erstwhile slaves. Greek names are especially common (e.g. Clepatra/ Kleopatra, Apluni/Apollonios, Atunes/ Adonis, Tiphile/Diphilos),³⁰⁹⁸ but Italic and occasionally Celtic names (such as Mucetis/Mogetios) are also found.

As a rule the *lautni* did not have civil rights (and so politically was not directly useful to his former master), but economically he was in a position to fend for himself. A few examples of votive gifts from freed persons are known from inscriptions (e.g. in Vulci).³⁰⁹⁹ His (freeborn) descendants did not bear the *nomen gentile* of the former owner. Freedwomen could marry outside the manumitting *gens*, in fact either freedmen or freeborn.³¹⁰⁰ The Roman system, which generally allowed freed persons (= *liberti*) limited civil rights, differed clearly on some points, although it too knew different kinds of manumission and in theory discriminated against the *libertus*. These

differences could thus have led to misunderstandings among the ancient authors.

3Social unrest

Beginning in the fourth century, severe social unrest in some Etruscan city-states is documented, namely in the inner and northern parts of the country. In general, the oligarchic upper class seems to have been quite unwilling to share political and economic power. The ancient tradition, however, scarcely makes it possible to precisely define the social groups that acted against the ruling nobility: urban *plebs*, freedmen according to Etruscan law, or true slaves. This problem interferes considerably with the analysis of the real causes of the revolts. Were they prefigured as inherent to the system, or were they prompted by especially harsh special circumstances in each individual case?

According to Livy, the unrest in Arretium in 302 was a rebellion of the *plebs* against the omnipotent *gens* Cilnia.³¹⁰¹ As regards the Roman intervention, which led to reconciliation, he had different sources available. Social tensions also appear in the *Elogia Tarquiniensia* of the Spurinna *gens*, engraved in the Claudian period, which speaks of a suppression of a *bellum servile* in Arretium that is not precisely datable.³¹⁰²

Even more unclear and interpreted by modern research in the most varied ways is the bloody revolt of 265–264 in Volsinii veteres, which left a lasting impression, not least because it resulted in the destruction of Orvieto by Rome (aside from the detailed account of Zonar. 8.7, see Val. Max. 9.1, ext. 2; Flor. 1.16; Oros. 4.5.3–5; *De vir. ill.* 36; John of Antioch, *FHG* IV.557 fr. 50.).³¹⁰³ Blended with the motif of *tryphé*, the accounts of the ancient authors seem to repeat the stages of the Roman Conflict of the Orders in a very accelerated way. The question of who the real actors were remains open. The vehemence of the events, however, shows that the oligarchic upper class must have completely lost control of the city at some point. Unfortunately, the prehistory of the events is also unknown to us. (Had the number of *domini* been thinned out in the struggle against Rome? How did the flagging of economic power affect the lower classes?)

The first true and unequivocally recognizable slave revolt took place in Etruria in 197/196 (Livy 33.36.1–31; see chapters 65 Marcone and 68 de Angelis).

4On the presence of foreigners in Etruria

Whereas the coastal cities in the Po delta like Spina and Adria clearly had a Greek component in their population before the invasion of the Celts, the

number of Greeks living in the southern Etruscan urban areas as merchants and craftsmen decreased sharply during the second half of the fifth century. With regard to the presence of foreigners, however, port cities lying farther north remained interesting, such as Populonia, with its flourishing metal industry,³¹⁰⁴ which even in the Late Etruscan period attracted foreign laborers, craftsmen, and merchants. Thus a Neo-Punic vase inscription of the third century has recently been recovered in the dromos of chamber tomb 4 of the Le Grotte necropolis;³¹⁰⁵ if there is, in fact, a direct connection between the occupancy of the tomb and the inscription, the presence of a socially and economically well integrated Phoenician-Punic metec in Populonia could be assured.

Alongside these personally free individuals, of course the slave trade brought to Etruria an increase in foreigners, often originating in the eastern Mediterranean, who on occasion achieved at least partial social integration as freedmen (see above).

Additionally, the onomastic material of Hellenistic Etruria includes a fairly large group of names that are of Italic—often Sabellic—origin or are ethnika on such a basis, particularly in the inner Etrurian areas (Volsinii, Chiusi, Perugia).³¹⁰⁶ The integration of Italics—in legally quite different ways—must be recognized since the earliest period. It appears in the Late Etruscan period, though, to have reached a new dimension, to some extent, especially in Perugia. From the start, that settlement had had the function of a bridgehead toward Umbria, and from the fourth century on it expanded considerably into these areas. Here the usually so-called “Vornamengentilizia” (= gentile names formed on the basis of a *praenomen*) are well documented. According to Enrico Benelli, these names were actually for the most part not formed on (Italic) *praenomina*, but on true (Italic) *gentilicia*.³¹⁰⁷ This could mean that freeborn Italics (in this case Umbrians) were taken in during the course of territorial incorporation into the polity of Perugia, although complete legal equality must not be assumed.

5 Women’s lifestyle and Hellenistic liberalization tendencies

Despite the general background of basic inequality of the sexes and traditional gender roles (cf. chapters 12 Amann and 53 Amann), in the Late Etruscan period, self-aware, proud Etruscan women take the stage. For example, we have Ramtha Visnai from Vulci, whose splendid mid-fourth-century sarcophagus depicts her together with her husband Arnth Tetnie. Larthi Cilnei, from Arretium, died highly honored in her new home, Tarquinia, at the age of 83. Seianti Hanunia Tlesnasa, whose well-preserved skeleton provides information about the living conditions of this matron of the Chiusinian

aristocracy of the late third-early second century.³¹⁰⁸ All three were honored members of the nobility and in this framework had representative duties to carry out. As brides they constituted an important means of alliance between the significant families of the land.

A passage by Theopompus of Chios from the second half of the fourth century (*apud* Athen. 12.517d–518b) is often—wrongly—cited for information about the freedom of Etruscan women. It reveals information about Greek self-definition, but it is not helpful for the evaluation of Etruscan social structures. In no way did the Greek have in mind a precise description of Etruscan customs, of which he had only the vaguest knowledge; rather it was his intention to define the Etruscans as barbarians of the West. To that end he invented a social organization the exact opposite of the Greek way of life, in which monogamic, marriage-like relations between the sexes were unknown, as were the fathers of all children, this being “customs of the land.”³¹⁰⁹ It is significant that Roman or Rome-influenced Greek writers never mention an extraordinary position for Etruscan women.

At the same time, the tendencies toward social liberalization typical of the Hellenistic period brought to Etruria a weakening of the rigid Archaic family structures and probably created greater freedom for women. Thus second-century inscriptions exhibit a clear increase in the custom of interring married women in the burial site of their family of origin, especially in northern Etruria. This probably reflects a change in matrimonial law, which now also knew forms of marriage with less legally-binding entry into the husband’s family (behind which, as in Rome, could lie requirements of inheritance law).³¹¹⁰ The role of the mother was generally respected, with the motif of mother and child a favored theme of Hellenistic tomb sculpture (e.g. the so-called *kourotrophos* Maffei from Volterra).³¹¹¹ Also, Late Etruscan tomb inscriptions sometimes give the number of children who were born or fathered, which usually amounted to fewer than five (thus not particularly high). The small single-chamber tomb of the Spitu, a family of the upper middle class in Tarquinia (*ET*² Ta 1.164–68), is informative in this regard.³¹¹²

Beginning in the fourth century, women are somewhat better attested epigraphically in the votive area as well;³¹¹³ dedications were made in the interest of the family, and perhaps even of the public (the sex of the dedicator of the two well-known bronze statuettes from the Porta Bifora of Cortona, which took on a protective function for the city, is unfortunately controversial).³¹¹⁴ There remains, of course, the problem of their active engagement in (public) cult practices outside the home. Aside from the oft-cited but lexically unclear appellative *hatrencu* in Vulci, we have only a few possible indications of priestesses.³¹¹⁵ The “Tomb of the Mothers and Daughters” in Perugia, whose inscriptions name only women related in a direct line, is an interesting case.³¹¹⁶ Whether it is more than the inevitable reaction to the epigraphically attested custom in Perugia of burying only men of one *gens* in a family tomb must for the time being remain an open question.

Marie-Laurence Haack

60Ritual and cults, 450–250 BCE

Abstract: A novelty of the Classical and Hellenistic periods is that a greater number of anatomical votive offerings were found in sanctuaries than before. This chapter endeavors to understand the meaning of that change by examining their medical, political and religious significance. It also examines the implication of the change in how the Etruscans related to death.

Keywords: Body, votive offerings, sanctuaries, health, fertility

Introduction

In the Classic and Hellenistic periods, there was a change in the forms of worship in comparison with the Archaic period, with new gods that were introduced. Offerings were dedicated to them, often in great number and in the image of human body parts. The richness of these deposits has been systematically studied since the mid 1970s.³¹¹⁷ These studies have allowed searchers to unveil the existence of worshippers who were often invisible in the Archaic period, a period when luxury and precious temple ornaments suggest that the donors of offerings were probably cities, communities, dynasts or tyrants.³¹¹⁸

1Medical significance of offerings

The offerings of Etruria's Classic and Hellenistic sanctuaries offer an overwhelming proportion of anatomical representations featuring limbs. From their presence, the healing character of the sanctuaries where the offerings were set down has long been deduced; in particular, the shape and quantity of these objects have given us information about the diseases from which the ancients suffered. The problem is that healing sanctuaries do not necessarily contain anatomical ex-votos and do not necessarily show that the disease was cured. For example, ex-votos in the shape of ears indicated that in some cases the dedicator sought the “ear”—the benevolent attention—of the deity. In addition, many offerings were terra-cotta votive offerings made from a mold, and therefore intended to meet the demand of the faithful suffering from various illnesses. Besides, the baking of clay could cause distortions in form

of protuberances, the material also wore out with time, the limestone was damaged, the terra-cotta broke, or coatings lost their original color. We should therefore wonder more about what this abundance of fragmented bodies and the massive presence of certain body parts—and not others—reveal.

1.1 Representations of human heads

Heads are the most ancient and numerous anatomical representations set down in the shrines of Etruria. The first heads date from the Late Archaic period and are attested in Falerii and Veii. According to some scholars, the heads are thought to represent the goddess worshipped in the sanctuary and were made on the model of masks and busts for Demeter and Kore in Sicily and Magna Graecia. According to others, to make votive heads, the Veian terra-cotta artists would have used prototypes intended for antefixes. Some votive heads, however, are covered or half-covered by a veil, which is mostly the prerogative of pious men. The appearance of terra-cotta heads in sanctuaries could thus mark a significant break in the history of worship in the sanctuaries of Tyrrhenian Etruria. Worshippers offered the gods a representation of themselves, rather than one of the gods they honored.

1.2 Representations of penises and uteri

After heads, internal and external genitalia were most often represented. The concern for worshippers to give birth to descendants naturally explains the profusion of votive offerings of this type, but some uteri have abnormal characters, such as appendages, small fibroids, or small ribs. It is not certain whether to consider these pathological pieces, because this type of interpretation is based on contemporary gynecological knowledge, and not on the anatomical knowledge of the Etruscans.

The only medical treatises or statements dealing with gynecology that could be used for medical practice in Etruria—the Hippocratic treatises—were written in Greek and therefore could be known only to a very limited elite. The first physician known in Rome, by comparison, is a Peloponnesian called Archagathos who came to Rome in 219 BCE, and the dissection of human bodies was not performed until the third century BCE at the medical school in Alexandria.

In addition, not all anatomical offerings should be explained in terms of the body part they represent, because anatomical offerings were also conceived of as representing the whole body. Aelius Aristides (*Orat.* 48.27.472) writes that to divert death, the god Asclepius advised him to “cut off some part of my body for the sake of the well-being of the whole. But since it was difficult, he

remitted it for me. Instead of this, he ordered me to remove the ring which I wore and to dedicate it to Telesphorus—for this had the same effect, as if I should give up my finger—and to inscribe on the band of the ring, ‘Son of Cronus.’ And if I did this, I would be saved.”³¹¹⁹

2Political significance

An explanation offered for the sudden spread and immediate success of the practice of anatomical ex-votos is that the increasing distribution of terra-cotta offerings would be the result of the simultaneous conquest of central Italy by Rome. The custom of making terra-cotta offerings would have spread from Rome to the subjugated territories, where the new *nobilitas* stemming from the *leges Liciniae Sextiae* would have imitated Greek forms of self-representation and terra-cotta limbs would have recorded the material stages of Roman expansion and the installation of Roman colonists in central Italy, from the conquest of Veii in 396 until the First Punic War.³¹²⁰

One of the consequences of this was that worshippers in the shrines were represented as givers or deeply religious people performing acts of Roman piety in Roman garb.

2.1The veil of piety

The presence of a veil on votive heads would indicate a Roman influence, not to say a “religious Romanization.” Roman rites were distinguished from Greek rites by the fact that the Roman sacrificer officiated with his head covered, while the Greek sacrificer was bareheaded. However, we should hesitate to attribute all the veiled votive heads to one of the consequences of the Roman conquest. The phenomenon of veiled heads made a late appearance in Rome, either in the late fourth or the third century. Moreover, Roman influence cannot explain why the most ancient heads, veiled or not, are overwhelmingly female. Another type of foreign influence should therefore be considered, either Campanian or Magna Graecian.³¹²¹ Indeed, in the Greek world, the veil is associated with marriage, especially for the worshippers of infernal gods, and veiling one’s head is also required in Greek mysteries. It was not until the very last years of the fourth century that Etruria’s votive heads displayed a veil closely associated with Roman piety.

In Rome and Latium this spread occurred at the same time on male heads as well. It was not characteristic of the worship of a specific god.

In the Etruscan area, veiled heads are to be found in large quantities, but in very different proportions in different shrines. From the late fourth and the third century, the geographic areas where votive heads were veiled

encompassed almost exactly those of the *ager Romanus*. In Veii, the first male votive heads—that is, heads which are not likely to be related to a female chthonic cult—are attested once the city was incorporated into the *ager Romanus*, after the defeat of 396. In Lucus Feroniae, where veiled votive heads were found in the third century, there occurred, according to Livy, so disturbing a portent in the year 210, that the pontiffs called for a *supplicatio* in Rome: thus Lucus Feroniae was considered a part of Roman territory. At Tessennano, where the territory has been divided into parcels of twenty *actus* reserved for settlers, over 60% of adult heads were veiled.³¹²²

2.2The citizen's toga

Toga-clad figurines in the votive deposits representing worshippers in Hellenistic Etruscan shrines signal a clear break with the customs of self-representation. Indeed, both male and female Etruscans during the independence period wore either a round mantle revealing a shoulder, called *tebenna* or the Greek mantle, called *himation*. The Romans wore the toga when they wanted to show that they belonged to the Roman city—especially in the Forum in Rome. In the minds of those who wore them, togas showed more a sense of commitment to citizenship and its functions than the actual possession of that right. In Etruria, togas were therefore perhaps not only worn by settlers but also by those Etruscans who were anxious to identify themselves with the Romans—even before being granted Roman citizenship. There are a few examples of togas being worn at Veii, in the sanctuary of Campetti; at Tarquinia, in the sanctuary of the Ara della Regina; at Punta della Vipera, at Bolsena in the sanctuary of Pozzarello, at Fontanile di Legnissina. We can add to these examples the late second century statue of the *Arringatore* in a toga, preserved at Florence, which is believed to have come from one of the Etruscan shrines.³¹²³

2.3The bulla

Another sign of the Roman influence on Etruscan religious practices is the reuse of the *bulla*, a locket containing an amulet, in many representations of children from the fourth century onward.³¹²⁴ In independent Etruria, adults as well as male and female children wore several *bullae* displayed by way of lockets, bracelets or necklaces, sometimes combined with other jewelry. The *bulla* disappeared from the representations of Etruscan adults and children from the late fourth century only to reappear in the second century solely in representations of children, thus repeating a Roman custom. Indeed, the Romans adorned the chests of young boys who were born free with *bullae*.

When such a boy hit puberty, he would take the *bullā* off, along with the *praetexta toga*, and dedicate it to the tutelary deities of the home on the occasion of the *Liberalia*. The Romans themselves said they had borrowed the *bullā* from the Etruscans.

By providing statues and figurines of children with a *bullā*, worshippers in Hellenistic Etruscan sanctuaries resumed an Etruscan custom, apparently without seeing it as a form of reappropriation of an Etruscan cultural heritage.

Bullae are indeed visible on terra-cotta offerings in sanctuaries where prevailing religious customs were, at least partially, those of the Roman conquerors.³¹²⁵

3Religious significance

The appearance of these clothing markers has long been ascribed to the worship of Asclepius.³¹²⁶ The most striking argument is the similarity between Greek offerings to Asclepius and Etruscan anatomical offerings: the limbs show no trace of diseases and are usually made of terra-cotta.

In Corinth, for example, offerings dating from the last quarter of the fifth century to the last quarter of the fourth are sometimes made of terra-cotta and painted red when they represent limbs of male bodies, and white when female.³¹²⁷

The similarities between Greek and Etruscan ex-votos have been explained by an identical worship of Asclepius. There are indeed Etruscan artifacts mentioning or representing Asclepius. A vase dedicated to Asclepius found near Chiusi dates to the time before the spread of anatomical offerings in Etruria, the late sixth or early fifth, or the fourth century³¹²⁸—in any case before the foundation of a temple dedicated to Asclepius in Rome. The theonym *Aisclapi* is indeed close to the forms *Aisklapios* and *Aisklapieus* found on the inscriptions of Epidauros, which at the latest, date to the early fifth century. In Bologna, near the courthouse in a suburban location, a figurine of a worshipper bringing an offering (third quarter of the fifth century) has a dedication to Asclepius in Greek.³¹²⁹ After the foundation of the temple of Asclepius in Rome, the cult of Asclepius is thought to have continued in Etruria until the imperial era. An Etruscan mirror from Bolsena dating from the third or early second century names the god *Esplace* which also has its origin in the Dorian form *Aisklapios*.³¹³⁰ Two tablets from Tessennano depicting viscera have a collapsed trachea ending in the head of a snake, the symbol of Asclepius.³¹³¹

How was the cult of Asclepius introduced? Two ways have been proposed: either through the mediation of Rome, where the god was imported by Q. Ogulnius in 292, or through the mediation of Southern Italy, where the cult of Asclepius might have been first imported. This last hypothesis is attractive

because in Sicily, Agrigento had a small Doric temple dedicated to Asclepius as early as in the late fifth century, and in Southern Italy, Taranto received Asclepius as early as in the middle of the fourth century and housed votive terra-cotta phalluses.

As for the idea of importation by Rome, it is based on the story of a Roman embassy of ten men in Epidaurus bringing to Italy the god Asclepius in the form of a snake. He would have first been worshipped on the Tiber Island before the building of a shrine dedicated to him at Fregelles in the second quarter of the second century.

Requests for healing might have been addressed mostly to Apollo.³¹³² Indeed many Hellenistic Etrurian sanctuaries contain figurines of a type of Apollo musician similar to Apollo Maleatas at Epidaurus: he is sitting or standing, naked or semi-naked, holding a lyre in his left hand and a coat or a plectrum in his right hand. The representation of Apollo with the lyre might have indicated the healthy character of the god: as the bow sent diseases and epidemics, the lyre provided care and healing. Apollo was in compliance with the oracle that he himself had made for Telephus about Achilles: “who wounds, heals.” In the wake of an epidemic, the official introduction of the cult of *Apollo Medicus* in Rome in 433 may have played a role in the evolution of the medical cult of the god Apollo in Etruria. A temple was then consecrated to the god and first dedicated by the consul Gnaeus Iulius in 431, and again after restoration in 353, and then used as starting point for solemn processions, between 207 and 200, towards the temple of *Juno Regina* on the Aventine, before being restored in 179. The worshippers of Apollo Medicus seem to have adopted the custom of offering anatomical terra-cotta votive limbs in the temple of the god. A whole string of anatomical offerings were found near the Ponte Garibaldi and the Ponte Quattro Capi; downstream, others found near the Ponte Cestio, Ponte Rotto and Ponte Palatino may come from the temple of Apollo Medicus which was nearby; and recently, ex-votos have been discovered in the southwest corner of the temple of Bellona, adjacent to that of Apollo Medicus.³¹³³

Yet it is not certain that the success of the musician *medicus* Apollo in Etruria should be explained by the Roman conquest of Etruria and the sending of Roman settlers into the vanquished territories. Indeed the cult of Apollo Medicus in Etruria seems to be at least as old as that of the god Asclepius in Rome.

At Villa Cassarini in Bologna (a single site), a naked statue of Apollo with a lyre, two bronze legs, and a bronze foot, all dated from the fifth century, were found.

Menerva is another popular deity who was charged with the education of young people in the Hellenistic period. On a whole series of mirrors in the fourth century, the goddess is shown with children, Tages, Epiur or Maris. There, Menerva is either a midwife, taking children by the arm, helping them out of vases placed on the ground as if out of the womb, or a maternal and

educative deity, receiving children from the hands of Heracles, who holds them firmly. The function of midwife may be evidenced in the sanctuary of Punta della Vipera where anatomical offerings are indeed numerous. Among the 131 anatomical offerings, thirty-one are reproductions of a phallus, and twenty-one are reproductions of a uterus. Menerva may have played the role of educator and protector of small children in Punta della Vipera too, since a figurine of a woman with a child and three fragments of swaddled infants have been discovered.

The goddess Vei might have specialized in fertility problems, since two terra-cotta uteruses, found in an area of Gravisca where terra-cotta uteruses abound, bear her name. It is even possible that the cult of Demeter ultimately superimposed itself on that of Vei. The sanctuary of Gravisca, for example, combines evidence of the worship of Demeter and of Vei near room G. There were found statues of female couples featuring Demeter and Kore, female masks of the fifth century resembling those found in the sanctuaries of Demeter and the other chthonic deities in Southern Italy and in Sicily, and a round altar of *Thesmophoria* on the west. Outside of room G, i.e. in the X area very close to it, were found terra-cotta uteruses, a dedication in Greek to the goddess dating from the fifth or sixth century, and two dedications to Vei dating from the first half of the fifth century.

In the fourth century, Uni also became a maternal deity, protector of births and young children. In the sanctuary of Gravisca, a bronze bowl with the name of Uni was discovered in room M. It contained 145 uterus-shaped votive offerings, or almost half the uteruses found in the sanctuary. It also contained twenty-two offerings of swaddled infants—more than 91% of the offerings of this type found in the sanctuary—and ten figurines of draped women. In the sanctuary of Fontanile Legnisina near Vulci, in a crevice of the cave adjacent to the altar, a figurine was discovered of a tunic-clad worshipper making an offering, dating from the first of the third century. There is a dedication to Uni on the leg. The worship of Uni was probably related, here too, to the sphere of reproduction, as numerous sexual offerings were found nearby, namely 234 terra-cotta uteruses and a dozen small phallic *cippi*. The cult also had to do with the health of young children, as eleven figurines of swaddled infants and thirteen votive terra-cotta breasts have been found on the site. At Pyrgi, where one of the two temples was dedicated to Uni, who is sometimes presented in Greek sources sometimes as Eileithyia, and sometimes as Leucothea, many votive objects may relate to the sphere of fertility and the cult of Uni. Thus, in the area in front of temple A, around seventy fragments of statues, including three swaddled infants, around 174 fragments of heads, and hundreds of anatomical gifts were unearthed. In the area facing temple B, a fragment of a statue, a head, three figurines and twenty-three fragments of lower limbs were found. Finally, in the area between the two temples, a fragment of a statue of a worshipper making an offering, three fragments of heads, an upper limb, and six lower limbs were

discovered.

The salutary action of some gods has been explained by the healing effect of waters that were placed under the protection of the same gods.³¹³⁴ The problem with this explanation lies in the lack of literary or epigraphic sources and of figurative representations clearly showing scenes of healing brought about by the waters' actions. On the other hand, it is absolutely certain that some waters were worshipped because they were considered the property of the gods. Not all waters possessed this divine value. Sea water was not worshipped in the big coastal sanctuaries like Gravisca and Pyrgi, but drinking water was worshipped³¹³⁵ given the number of votive objects set down into sources of potable water nearby. These include lakes like the Lago degli Idoli on Monte Falterona, where, among more than 600 votive donations that were set down, a statuette of Heracles was found.³¹³⁶ They also include spring waters around which sanctuaries were sometimes erected, like the sanctuary-spring of Marzabotto, where two anatomical ex-votos of the fifth century were discovered;³¹³⁷ and the spring waters near which votive offerings were set down, as in Vicarello, where a collection of objects from the eighth to the fourth centuries was unearthed.³¹³⁸ Sometimes, the water was kept in basins or cisterns as in Falerii Veteres, in the sanctuary of Vignale, which housed about 100 anatomical ex-votos, including a dedication to Apollo of the late fourth or early third century discovered near the cistern. Drinking water seems to have lost its religious character at the end of the Hellenistic period. In Sasso Pisano near Larderello, where the water had hitherto fulfilled religious purposes, an edifice was built in the second half of the second century to use hot and cold springs as a cure.³¹³⁹ In Musarna near Viterbo, in the late second century, a temple was turned into a small spa.³¹⁴⁰

4The Etruscans and death

The fact that the Etruscans were concerned with entrusting the care of a sound body to the gods had as a consequence a new concept of death and of life in the beyond.³¹⁴¹ Thus, in the Hellenistic period, what is beyond the grave seems to gain in importance as never before. The tombs, stelae, and sarcophagi display an increasing number of representations of what lies beyond the grave. Death is seen as a voyage—frequently by land—to the beyond, where the deceased are shown feasting. In Volsinii-Orvieto, on the frescoes of the Golini I Tomb, the deceased, comfortably dressed as if for a long and perilous journey, arrives on a chariot and is welcomed by feasters who were no doubt recognized as members of his clan who predeceased him, since Hades and Persephone are present. The journey to the beyond is also done by sea or by river. In Tarquinia, on the wall of the Tomba dei Demoni Azzuri (Tomb of the Blue Demons) in the Calvario necropolis, dating from

the late fifth century, a benevolent demon guides the deceased woman to the bank of a river that Charun is to help her cross, while on another wall, four couples lying on four *klinai* take part in a banquet. In Tarquinia, in the Tomba dell'Orco I (Tomb of the Orcus I), a demon attends the banquet; and in the Tomba degli Scudi (Tomb of the Shields), couples of the same family (*gens*) feast very close to a demon holding a hammer in each hand. Demons are present in scenes that are not funerary at first sight. In the famous fresco of the fourth century François Tomb in Vulci, which show the massacre of Trojan prisoners, the infernal demons Charun and Vanth appear. The latter, often represented with wings and an inscribed roll, seems to announce the fate awaiting the deceased; more often than not she is not alone but in the company of several female spirits, winged or not, who lead the deceased.

New forms of worship of the dead also appear. In the Vulci, San Giuliano and Chiusi necropolises, small shrines are built whose upper parts are decorated with terra-cotta. This evolution results in a transformation of the tomb shape: in the Caere, Stigliano, Blera, Grotta Porcina and Bomarzo-area necropolises, in the late second and first centuries BCE, tombs in the shape of temples or altars were built; these tombs replaced the cube tombs of the previous period. The large aristocratic monuments of the sixth and fifth centuries began to be reproduced in the shape of cippi or small cube-shaped monuments with false doors. A good example of this sort of stele is provided by the *ara Guglielmi* of Vulci, dating from the third century, where on the front, between two columns, the deceased appears so as to benefit from the sacrificial rites being performed before this funerary altar.³¹⁴²

Sanctuaries seem to be dedicated to the gods, such as la Cannicella in Orvieto, where small temples (*naiskoi*) reserved for the worship of the dead, are found.³¹⁴³

61Economy, 450–250 BCE

Abstract: The period from 450–250 BCE witnesses a number of changes in Etruria's economy, some of changes related to the international and regional relationships that each city had. This period saw the fall of Veii, as well as changes to the north in Po-area Etruria. In many areas, the demographic concentration of the hinterland increases in tandem with a rise in agricultural production.

Etruscan sanctuaries played an economic role in their larger community at all times; the evidence for this activity in this period is considered here. This activity includes the votive objects themselves, some of which, at least, seem to have been purchased at the sacred site. The resources that a temple could amass because of dedicatory offerings could even attract looting, for which there are attestations during this period. Weights found in sacred contexts also allow us to understand more about the economic dimensions of the temple. Finally, the evidence for coinage and state property is briefly reviewed.

Keywords: coinage, economy, votives

Introduction

The onset of the Classical period saw the steady decline of Etruscan trade at the sites of traditional *emporion*, and at the same time, the development of new and expanded economic opportunities at Populonia and in the Po Plain. The new economic realities of this period in Etruria were, at times, connected to Rome and its progressive expansion northwards. In 396 BCE, Rome annexed the territory of Veii and dispatched colonists there.³¹⁴⁴ The wars between Veii and Rome, according to the ancient historians, had occurred intermittently since at least the time of Romulus. While the causes of this deep rivalry are manifold, the economic tensions between these two sites are easy to spot, for they both aimed at controlling the vital Tiber river traffic. Both Rome and Veii were also active in the salt trade, and when Rome first defeated Veii in the eighth century, ancient historians later recorded that Rome took land away from Veii that included the salt beds.³¹⁴⁵

61 Economy, 450–250 BCE

1The Po Plain

Etruscan territory was encroached upon along its northern boundaries as well, when the Gauls took much of the Po Plain in the first half of the fourth

century. The Gauls occupied Marzabotto and became the “chief middlemen” for the long-distance trade passing through that area.³¹⁴⁶ The transportation networks controlled by the Etruscans in this area experienced changes, as did the population. The number of Attic vases reaching Felsina in the fourth century fell drastically from fifth century levels, but Spina itself continued to receive a large number into the end of the fourth century.³¹⁴⁷ Indeed, the port city of Spina continued to thrive from the second half of the fourth to the late third century, with funereal and epigraphic evidence pointing to an increased population, which may be a result of Etruscans moving from elsewhere in the Po Plain during this crisis period. In fact, the dominance of this Etruscan port was so strong that the Athenians became concerned about the safety of their grain due to the Etruscan pirates in this area.³¹⁴⁸ The tombstone of Vel Kaikna (end of the fifth century) testifies to the vitality of Etruscan maritime commerce at this time (Fig. 61.1). It depicts a large Etruscan merchant marine ship at sea.³¹⁴⁹ Interestingly, Vel Kaikna was buried at Felsina (Bologna) but plied his trade in the Adriatic waters based out of Spina, which, as Giuseppe Sassatelli notes, shows the commercial interconnectedness of these two important sites.³¹⁵⁰

2Land use and the changing agricultural economy

Whether by a greedy Gaul or a land-hungry member of the Gracchi family, the territory of the Etruscans was historically targeted by the Romans, Gauls, and others. The fecundity of Etruscan soil was cited as one of the reasons the Gauls entered central Italy in the fourth century:

“The story is handed down that this people, entranced by the delightfulness of the produce of the fields and especially by the new (at that time) pleasure of the wine, crossed the Alps and possessed the fields previously cultivated by Etruscans.”³¹⁵¹

According to the ancient historians, the Clusine merchant Arruns traveled north to trade with the Gauls, bringing with him products of Chiusi: olive oil, figs, and wine.³¹⁵² The story goes on to explain that the Gauls were so impressed by these products—which they considered superior to their own—that they were easily persuaded by Arruns to invade Chiusi. Arruns told the Gauls that the land of Chiusi was large, fruitful, and sparsely inhabited. The story of Arruns, however fictional, does have many points of interest for an economic examination of this area. Such references to the irresistible fecundity of the Etruscan lands provide a strong impression of a robust and varied agricultural production.

During the fourth century, in many territories (e.g. Tarquinia, Chiusi, and Fiesole), the minor settlements that had been prominent in the Archaic period rebounded, and other, new small centers developed. One notable trend during

this period is the emergence of a group of small hilltop settlements that correspond closely to the Latin term *castellum*.³¹⁵³ While many of these sites were occupied in the Archaic period, it is in the fourth and third centuries that they acquire monumental fortifications. *Castella* are found in many areas of Etruria, but notably in liminal areas between the borders of city-states. The increasingly dense occupation of the hinterland by such sites, as well as other small centers and farms, points to a more intense agricultural production that would have served these minor centers as well as the larger ones, and evidently provided sufficient yields for export (see [chapter 67](#) Becker). Rome at this time certainly knew of Etruria's agricultural strength, because Rome asked for grain repeatedly during the fifth century.³¹⁵⁴ While in later Etruscan history, grain could be something demanded from Rome as an indemnity or as an ally's contribution to a war effort,³¹⁵⁵ in this earlier period Etruria was the “go-to” area for acquiring grain (*ad frumentum mercandum*)³¹⁵⁶ to relieve Rome's occasionally blighted supply.

3Economy and the sacred sphere

Votive dedications were made in Etruria as early as Proto-Villanovan times and the dedication of votives continued after the collapse of many of the most popular sanctuaries in late Etruscan/early Imperial times.³¹⁵⁷ The dedication of votive objects was inherently an economic transaction.³¹⁵⁸ Whether a dedicant brought first fruits, coins, a bronze statue, or a molded terracotta shaped like a human body part, these products were intended as a reciprocal exchange with the gods. The Latin formula, *do ut des*, roughly means “I, the dedicant, give something so that you (the god) should give something in return.” Thus offerings given to the gods were usually made to ask the gods for assistance or to give thanks for help already rendered.

During this time mold-made terracotta votives could be manufactured more quickly and at less expense for dedicants. Focusing on one type of these votives in particular, the widespread use of anatomical votives is economically relevant because they are typically not found in different contexts (e.g. homes, tombs, etc.), but occur only in known sacred spots or sites that could have had a sacral import. For this reason it is highly likely that souvenir stands existed at sacred sites, ready to sell worshippers the anatomical votive (or figurine) that best suited their dedicatory need(s). Such souvenir stands—likely made of wood—would leave little or no archaeological trace.

In her study of anatomical votives, Jean Turfa notes that out of the perhaps tens of thousands that were made in terracotta (and occasionally in metal) from the late fourth to the first century, only four extant Etruscan anatomical votives were inscribed.³¹⁵⁹ A prefiring inscription made on a terracotta model

of a knee found at the Ara della Regina at Tarquinia indicates that “Vel Tiples dedicated” it.³¹⁶⁰ The handful of terracotta anatomical votives that were inscribed beforehand indicates that these were specifically commissioned before they were fired. But for the thousands of other such votives, many of them were made in batches in advance in order to be sold at sacred sites to whomever might have had the need to buy such products.

Over time, sanctuaries could amass large amounts of resources such that they served as treasuries of a sort. Some resources with short shelf lives, like agricultural donations, could even have been used by the sanctuary staff. Considering ancient economies in general, Karl Polanyi posits, “the personnel of the temples consumes a large part of the payments made to the temple in kind,” such that we might imagine offerings such as first fruits being consumed by the temple staff and their families.³¹⁶¹ When and where coinage (as well as pre-monetary devices such as *aes signatum*) were used, such offerings could have also been used by the staff of a sanctuary.

And while—according to ancient *mores*—temples were sometimes considered off-limits for military looting, the wealth of stores that temples could contain made them prime targets for rapacious generals. In 384, Dionysius of Syracuse went to war against Etruria ostensibly for the suppression of pirates. He used a wealthy Etruscan sanctuary at Pyrgi, where he collected “no less than a thousand talents,” to help finance his continued expedition.³¹⁶² The fall of Volsinii in 264 was lucrative, perhaps due to its sanctuaries—sanctuaries which may have included the *Fanum Voltumnae*. Pliny the Elder records that the Romans took 2,000 statues (probably votive statues) as their booty. Indeed, Pliny’s report of statues being taken from this site may not be without merit, for the Roman victor Fulvius Flaccus set up a dedicatory monument in front of the twin temples of Fortuna and Mater Matuta at the sanctuary of Sant’Omobono in Rome.³¹⁶³ On the top surfaces of both *donaria* (one of which was inscribed: Fig. 38.10), divots with traces of bronze can clearly be seen (Fig. 61.2). These divots very probably once held a few of these statues and were perhaps part of Flaccus’ personal spoils.³¹⁶⁴

Fig. 61.2: Rome, Area sacra di Sant’Omobono: the circular *donarium* of M. Fulvius Flaccus. Indentations along the top are attachment points for bronze statues. (Photo credit: H. Becker. Used with permission, Sovraintendenza ai Beni Culturali di Roma Capitale) 61 Economy, 450–250 BCE

Offerings made at Monte Falterona between the sixth and third centuries include more than 1,000 pieces of bronze and copper, numerous pieces of *aes rude*, as well as some *aes signatum* and *aes grave*, amongst other offerings.³¹⁶⁵ The excavators observe that the *aes rude* deposited at the site varies in size and this points to an ancient tradition where bronze was a weight standard by which other things were valued. Thus in a consideration of consumer preferences and how goods were used, sacred sites and their dedications should be considered.

4Weights in the sacral sphere

The presence of weights at sanctuaries speaks to careful accounting—certainly a form of economic behavior—that occurred in the sacral sphere. Metal weights were found in a number of different contexts, such as the weight discovered at the late archaic farm, datable from the second half of the sixth to the middle of the fifth century at Pian d’Alma (Vetulonia) (see [chapter 28](#) Maggiani).³¹⁶⁶ Adriano Maggiani writes that of ten extant, inscribed weights, five can be associated with a sacred context on the basis of their findspot or the specific content of their inscription.³¹⁶⁷ The great majority of weights date to the fourth and third centuries, although weights were certainly

in use long before (such as the stone weights from Po-area Etruria discussed in [chapter 55](#) Becker). Two weights associated with a sacred building at località I Fucoli at Chianciano Terme are bronze with a lead core and date to the late fourth to third centuries.³¹⁶⁸ These weights seem to be a pair, as they both take the form of janiform heads; one has the face of a woman on each side, in the other, a maenad and a silenus. The maenad-shaped weight weighs 265 g and the other 576 g. Given that the first weight is heavily worn (and so might have originally been 288 g), it seems that these objects conformed to the same scale, so that one was twice the weight of the other. The aforementioned metal weight from the farm at Pian d'Alma is also 288 g, which is believed to correspond to the Etruscan pound in south-central Etruria.³¹⁶⁹ A weight dating to the third century—now in a private collection—has an inscription dedicated to the god *Catha*.³¹⁷⁰ This weight can be related to the two from Chianciano because it weighs 144 g, half of the aforementioned pound.

A weight dating to the fourth–early third century from the sacred area of Sant'Antonio at Caere reveals even more about the weight standard and how these weights might have been used ([Fig. 28.3](#)). It bears a ten-line inscription that has a number read as “IIC” or “2.5.” If one discounts the weight of the hanging ring that once supported this object, it weighs 716.28 g; 716 g is roughly 2.5 times the Etruscan pound, such that this seems to be another standardized weight.³¹⁷¹ In addition, the inscribed weight is dedicated to *Turms* (with the possible epithet of *Rath*), the Etruscan Mercury. The Greeks believed that Mercury was the inventor of weights and measures, and it seems possible from this weight that *Turms* may have had a similar association for the Etruscans.³¹⁷² The inscription further states that the weight was dedicated by L(ar)c(e) Penthe and Vel Lape in the sacred area of *Hercl* (Hercules) when Larth Nulathe was serving as a *zilath* (*zilc*), a chief magistracy.³¹⁷³ But it is the name of a magistrate on a votive gift of this nature that should draw attention. Were the dedicatees concerned with eponymously dating their gift so that the god would know in what year Larce and Vel had been so generous? That does not seem to be the case based on contemporary Roman practice.

In ancient Rome, first the *aedilis* and later the *praefectus urbi* was charged with enforcing the weight standard, and they would compare any unknown quantities against those public weights that were kept at sites such as the Capitoline temple or the temple of the Dioscuri.³¹⁷⁴ Some of these weights bear inscriptions that state where and under whose authority they were deposited. In the case of the Etruscan example, it may be the *zilath* or other magistrate was charged with ensuring the accuracy of the inscribed weight.³¹⁷⁵ Thus it seems that this weight, and the other weights associated with religious contexts, may have been gifts given that could have been used by the temple staff. To bring back to mind the evidence of wear on the lighter weight from Chianciano, it is possible that this weight was used before it came to the sacred site—that is, that this weight was used in daily life and

then came to be dedicated. With that with possibility not being excluded, the collective evidence of these weights suggests that this wear could have also resulted from use at the sacred site itself. At the very least, the presence of such tools at some sacred sites suggests that weights could have been used to weigh donations of gifts made at a sanctuary.

5Coinage

The first recognizably state-issued coins in Etruria were minted by Populonia in silver and the first datable coin (second half of the fifth century) was found in a secure context at Prestino (Como).³¹⁷⁶ Catalli observes that the use of a standard currency at Populonia may have been encouraged by the “internal market” between this city and Elba, which involved the transportation and processing of Elban ore.³¹⁷⁷ Mauro Cristofani, while acknowledging this possibility, also suggests that the impetus for the introduction of coinage at Populonia could have been the expense incurred by the city for defending itself against incursions by Syracuse in 453 and 384 BCE.³¹⁷⁸

Importantly, not all city-states seem to have minted coinage, and it was never pervasive for basic transactions. Some cities see a limited circulation, and the coins of one city do not seem to be used all over Etruria, but the coins instead tend to follow the major trade patterns enjoyed by the issuing city itself. For example, Populonia’s coins do travel beyond its territorial borders during the fourth and third centuries, and are found in Cecina, Aleria (Corsica), Elba, Roselle, Vetulonia, and even towards the interior (Sovana and the Ombrone Valley).³¹⁷⁹ For more on the monetary issues of other cities, see [chapter 27](#) Catalli in this volume.

6State property

The ability to mint standardized coinage certainly shows the economic strength of a city-state. A few examples from the Hellenistic period demonstrate that the state was buying property and labeling it. The word *spura* refers to the city and is found in different forms (e.g. the adjective *spurana*) or even abbreviated as *sp/spu*.³¹⁸⁰ Much like the Greeks labeled state property as *demosion*,³¹⁸¹ this word seems also to have marked objects owned by a particular city-state. Other objects were labeled as state property in this period include: a helmet,³¹⁸² some roof tiles,³¹⁸³ a bronze vase,³¹⁸⁴ and an irregularly shaped piece of bronze (possibly *aes rude*).³¹⁸⁵ A *dolium* from Chiusi, dated to the third century BCE, reads *mi spurat* or “community property.”³¹⁸⁶ It could be that this vase was used for a city function and/or for redistribution. Or it could be that this vase was a standard liquid or dry

measure, and that like the small piece of bronze (if it has been correctly interpreted), it might provide evidence of the city-state being involved in regularizing trade and commerce. The aforementioned inscribed weight from the sanctuary at Sant'Antonio at Caere certainly would fit within this hypothesis.

Conclusion

While the material presented here represents a concise overview of the economy of this key period, certain important trends have emerged. By highlighting two societal spheres—the state and the sacral sphere—that are not often considered in terms of the Etruscan economy, it has been possible to elucidate key information about the economic dynamics of the Etruscan state and Etruscan ritual centers. On another level, changing regional settlement patterns in certain areas had important consequences in terms of demography, productive capacity, and the ethnicities present. In the next centuries, the economic history of Etruria would at times overlap significantly with that of Rome, especially because intermittent truces, treaties, or even outright warfare certainly affected the interchange between Etruria and Rome. By the third century, Roselle, Tarquinia, Caere, Vulci and Volsinii would fall, and Rome would take on territory along the Etruscan littoral.³¹⁸⁷

62 External Relationships, 450–250 BCE

Abstract: From a political perspective, the external relations of Etruria between the fifth and third centuries BCE were deeply related to the struggle for supremacy in the Tyrrhenian and Adriatic Seas, and the policies of the major powers of the time—Athens and Syracuse. Etruria was important both for the control of grain markets of the Arno and Po Valleys and the acquisition of iron and other metal deposits of Tuscany, but also as a bridgehead for trade with Central Europe. Such intense exchanges did not only involve the political and commercial dimension: data provided by personal names attests to the stable presence of Greek individuals in Etruria at different levels of society. Some episodes mentioned in the literary sources allow us to reconstruct the dynamics of the expansion and contraction of the Athenian and Syracusan spheres of influence in the western Mediterranean, but it is from the archaeological data—and above all from the importations of ceramics—that it is possible to shed light on the issue. The situations shown by the archaeological record vary widely in different parts of Etruria, both because of the different social structures of the Etruscan cities and the different international political balance in the middle and lower Tyrrhenian Sea and in the Adriatic Sea. In the fifth century, the Syracusan hegemony grew in the Tyrrhenian Sea, while Athens resumed its own policy towards the western Mediterranean, vying for control of the routes leading to the grain markets of Spina, Adria, and beyond. The end of the century saw a deep change, with the arrival on the scene of the Campanians, who took Capua in 423 BCE. The allocation of the Samnites in the Nolan and Picentian countryside mark the end of the Etruscans in Campania, while the arrival of the Gauls in the Po Valley and the subsequent crushing of the system closes the era of Etruscan control of that region. The Etruscan world is thus enclosed within the boundaries that will mark Etruria in the administrative division of the Augustan *regiones*. Rome was going to subtract Veii in 396, while Syracuse was going to plunder the sanctuary of Pyrgi in 384. Within the framework outlined by these events, the political structure of the Etruscan world elaborates a profound transformation of social geography and geometry, which has different methods and timing in various districts of the region. After a period of reactivation in the late Classical and early Hellenistic ages, by the first half of the third century, the rise of Rome will mark the beginning of the slow decline of dynamism of Tyrrhenian Etruria.

Keywords: Tyrrhenian Sea, Adriatic Sea, Attic Pottery, Piracy, Syracuse

1 Tyrrhenian Sea

The years around the mid fifth century BCE are without a doubt one of the most critical moments of the entire history of the Etruscan world, marking a period of profound changes in both the Tyrrhenian area and the Adriatic area including the Po Valley. In these years, the Syracusan hegemony grew in the Tyrrhenian Sea. In conjunction with the loosening of the Athenian presence in this area after the failure of the expedition in Egypt in 452, Syracuse launched

an attack against the Etruscans in 453–452, first under the command of Phaillos, and later under Apelles (Diod. Sic. 2.88.4–5). Continuing the politics of Hiero I, who had occupied and fortified Pithecoussai in the Bay of Naples twenty years earlier (in 474, the year of the battle of Cumae), the Syracusans founded Portus Siracusanus in Corsica and simultaneously occupied Elba, where they established, albeit for a short period, the so-called Port of Argo. The literary sources (*Mir. ausc.* 105; Strabo 5.6; Diod. Sic. 4.56.5) project this settlement in the mythic tale of Jason and the Argonauts. The Syracusan domain on the island, which occupies a central place in the Tyrrhenian Sea not only in the plot of the routes, but also for the importance of its mineral deposits, was short lived, and Elba soon passed under the control of Populonia. However, Apelles' efforts probably lead to the crisis of the southern centers of Tyrrhenian Etruria, which had already suffered the repercussions of the events of 474.³¹⁸⁸

For its part, Athens sealed a thirty-year truce with Sparta in 446/445 and resumed its own policy towards the western Mediterranean. It founded Thurii and the *philia* with the Messapian population, Neapolis (*epoikia* of Athens and Chalkis), and the network of alliances with the western Chalkidian cities, which has been renewed in 433/432 in the case of Reggio and Leontini. In term of Athens' granary needs, Neapolis was closely intertwined with Cumae, Dicearchia and the Etruscan cities of Capua and Nola. Etruria was important too, both for the control of the Arno and Po Valley grain markets, and the acquisition of iron and other metal deposits in Tuscany.³¹⁸⁹

Literary sources concerning the policy of Athens in these years do not explicitly reference Etruria. However, the *symmachia* between Athenians and Etruscans during the second great Athenian expedition to Sicily in 415 is mentioned by Thucydides (Thuc. 6. 88. 6), who saw three Etruscan *penteconterai* reaching Demosthenes, Eurymedon and the other Athenians in the siege of Syracuse in the summer of 414/413 (Thuc. 6.103.3–4). It is easy to assume that the *philia* of these years was a continuation and development of premises posed earlier.

The text by Thucydides does not specify which Etruscans participated in the expedition against Syracuse. The reference to a plurality of Etruscan cities suggests that the alliance between Athens and the Etruscans was to be implemented through the channels of the league of *Duodecim Populi Etruriae*. A first century CE Latin inscription commemorating Velthur Spurinna—a noble from Tarquinia who was the first Etruscan to reach Sicily with an army (Fig. 38.13)—gives us, perhaps, the name of the commander of the contingent that participated in the siege of Syracuse in 413, and indirectly confirms the fact that the *symmachia* was between Athens and the Etruscan cities on the Tyrrhenian Sea. It is much more difficult to identify which cities these were. In addition to Tarquinia, some other indication may come from the recovery of Pylia legends connected with the figure of Nestor and the Neleids. These legends characterize Athens' ideological horizon in the years

of the treaty with Segesta, in a moment of special significance for the political relationships of Athens with the West and the Tyrrhenian area. They seem to be the most appropriate ideological mediation in order to develop an adequate historical painting of the political orientation in Tyrrhenian Etruria, both within individual groups of aristocrats—as in the case of Satie family in Vulci, who had Nestor as their mythical ancestor—and in entire communities—as in the case of Pisa, which was founded by Nestor's Pylians according to a tradition recorded by Strabo. The Pylians would have come to the West during the Trojan *Nostoi*, founding the cities of Metaponto, in the Ionian Gulf, and Pisa, in the upper Tyrrhenian Sea. The legend of an Ionian consanguinity was source of law and predestined solidarity with Athens, so it follows that the *symmachia* stipulated in the winter of 415/414 included among its actors both the cities of southern Etruria and those of the northern Tyrrhenian district.³¹⁹⁰

Since the data mentioned by tradition does not offer further evidence, and other clues are very unstable, extreme caution is mandatory in historical reconstruction. However, even if we can legitimately assume that similar relationships and alliances between Athens and the various Etruscan cities proceeded on several occasions—including in the form of individual *philiai* with local rulers, as in the corresponding case of Artas, a Messapian lord (Thuc. 7. 33. 4)—the *symmachia* of 415/414 is adequate for the scenario offered by Etruria in the second half of the fifth century. In the case of Metaponto, another ally of Athens at the time of Demosthenes and the Eurymedon effort, the conflict with Taranto that arose after the founding of Heraclea (the Achean city under pressure both by Taranto and the inland Lucanians) may have offered a means of alliance with Athens, according to the political and diplomatic processes that characterize all the action of Athens during the second half of the fifth century. In the case of Tyrrhenian Etruria, on the other hand, the activation of the alliance with Athens against Syracuse was the result of the shipments of Phailllos and Apelles in the upper Tyrrhenian Sea at the century's halfway point.

The Syracusan affairs seem to have left no traces on the archaeological record, except for the presence of rare coins from the mint of Syracuse in the port of Pisa, at the mouth of the Arno River, at the Basilica of San Piero a Grado.³¹⁹¹ The relations of Athens with the Etruscan world are instead very much in evidence, and go beyond simple—yet statistically significant—economics and commercial life.

2Adriatic sea

Athens paid much attention to the Etruscan district of the northern Adriatic Sea. Athens had been interested in this area since 470/460, as the mythic Attic

tradition with the Sophoclean version of the legend of Antenor (which is set among the Venetians) indirectly attests. Athenian policy and support to the Greek colony of Korkyra in 436/435 should be seen as a function of protection of the routes that led to this area through the Strait of Otranto.³¹⁹²

It is possible to see the presence of Attic *emporoi* and *naukleroi* active in the first half of the fifth century in the network of trade that took place in the markets of Adria and Spina. Here the Po Valley cereal production was sold, along with other food products and goods that were meant to meet Attic and more generally Aegean demands. The dedicatory inscription written in the Attic alphabet on a *kylix* of the first quarter of the century found in Adria is a clue of this presence. Not by chance, the Greek names on the inscriptions from Spina, starting from 475, show a predominant origin from Athens of the Greeks in the city. The Aeginetic component decreased after 457/456, after the victory of Athens over the city of Aegina and the seizure of the island's military fleet. Thus, during the entire second half of the century, the role of Athens became predominant—though not exclusive—in this very complex *emporion* characterized by a wide polyphony of accents. These accents can be seen from the Attic, Aeginetic, Corinthian, Korkyrian and Siceliote trademarks on pottery and from the commercial amphorae diffused in the Po Valley. In addition to Attic, Corinthian and Korkyrian specimens, there are amphorae from Chios, Samos, Mende and the so-called Ionian-Marseille type, now firmly associated with the wine production of the western Chalkidian area, which is to say Siceliote.

Within this framework, in Spina and the other Po Valley centers we find the extraordinary diffusion of Attic painted vases and black-glazed ware. The arrival of the Celts there and the steady expansion of their possessions in the sub-alpine region were changing the political balance to the detriment of the Etruscans. This situation culminated in the second quarter of the fourth century with the appropriation by the Boii of the area between the Po and the Apennines, occupying the territory of Etruscan Felsina.

Unlike the Tyrrhenian area, where after 480 the influx of Attic pottery begins to decline, from the second quarter of the century to the second half of the fourth century, Spina is one of the most important steps in the process of distributing Athenian products in the western Mediterranean. Attic pottery was linked to the needs of an emerging class, and had a specific relief in Spina, providing reference points needed to satisfy the needs of individuals and social groups. The phenomenon appears to be intense compared to the situation in other western areas concerned with the presence of Athens. Both the quantitative aspect of the phenomenon and the widespread distribution in modest contexts give us a glimpse of this situation. Attic ceramics continued to arrive in Spina even after the end of the Peloponnesian War and during the Dionigian phase.

Such intense exchanges hardly involved only the commercial dimension. Data provided by personal names testifies the stable presence of Athenian

individuals in Spina. The woman and other people buried in tombs 147A, 136A, 1049B and 405 were from Athens, as it is possible to see from the presence of white ground *lekythoi*, a particular kind of vase exclusively linked to Athenian funeral practices. Other evidence, such as the presence of small red-figure *choes* in a small number of infantile graves (tombs 35, 104, 564, 1007 from the Valle Trebba area)—connected to the Dionysian festivals of Anthesteria and typically Attic—looks more uncertain, but no less significant.

It is still difficult to see how Athens was a paradigm of reference in the complex and still little-known political and cultural history of Spina. From the data in our possession, however, through the commercial channels, it is possible to recognize a phenomenon of conscious selection of the vascular repertoire, ordination of particular shapes, and reporting to Attic artisans, of Spinetic market preferences.

All the classical Athenian workshops are represented in Spina—not only the pottery painters marked by deeply individualism, but also those artisans of more modest stature who are more distant from the creations of great masters. From the point of view of shapes, it is possible to see how the reception of Attic pottery is guided by specific guidelines both in taste and ideology. Thus the preference for the *krater*, in all its morphological variants, is accompanied by a little attention to the shape of the homologous *stamnos*, a form produced by the workshops of Athens by the end of the sixth century probably for the Etruscan market and for the Etruscan areas of Campania. Among the drinking vessels, there is a clear preference for the *kylikes* B-type, both black-glazed and painted. *Skyphoi* are much rarer than *kylikes*, as documented by high-quality examples and the more modest versions of the Saint-Valentin class. However, the particular preference for *kylikes* is confirmed by the high number of this type of vase in the late fifth century and at the beginning of the fourth century. They were sometimes decorated by the finest Attic pottery painters of the moment, such as the Kodros Painter, the Eretria Painter, the Fauvel Painter, the Calliope Painter, the Meleager Painter, the Jena Painter, the Diomedes Painter, and Aison. Until the third quarter of the fourth century, there is a significant number of red-figure *skyphoi* of the Fat Boy Group and similar productions, even if the phenomenon seems more linked to the characteristic of production in this time—when from the beginning of the century, one of most popular forms is the *skyphos*, which gradually replaces the *kylix*—than to shifts in taste.

Starting at the end of the fifth century and in the first three quarters of the fourth century, the presence of Attic pottery in Spina is clearly different from the rest of Etruria. For the presence of high-quality cases, this is both morphologically true—such as the large volute krater found in the tomb 136 painted by the Painter of Athens 12255 and hump A of Valle Pega, and ideologically true, such as the *lebes gamikos* of the Meidias Painter entourage in the tomb 1166, Valle Trebba. This is very close to Attic ideological heritage and may not be separated from involvement with the cults of Eleusis. Attic

pottery in Spina is also clearly different from the rest of Etruria based on the extraordinary occurrence of particular forms decorated in red-figure technique. In addition to fish dishes—a substantially non-Attic shape of which twenty-one specimens were found in Spina and one specimen was found on Monte Bibele, in the Idice Valley on the Bolognese Apennines (where it came through Spina and perhaps Felsina)—the stemmed dishes have particular significance. They are shaped in a very peculiar way, which was related to the specific needs of the symposium and convivial ritual of the communities of the Etruscan Po Valley and upper Adriatic Sea. In fact, despite sporadic appearances in Rutigliano and Ruvo in the Peucetic area in Apulia, this kind of vessel is documented only in Numana and Spina, and significantly in Felsina and the surrounding area (Marzabotto and Sasso Marconi). The occurrence of local versions carried out on Attic models in the oldest manufacturing of the Picenian area in the middle and high Adriatic Sea indicates how the type substantially constitutes an Adriatic phenomenon. The concentration of Attic specimens in Spina is also significant. This shape had to be of particular value, since a prestigious large *kylix* from tomb 733 in Valle Trebba, and two small cups—one by the Aberdeen Painter and the other by the Painter of London E777—in tomb 991 in the same area, were cut out as stemmed dishes.

In addition to Attic pottery, Corinthian pottery also reaches Spina—not only commercial amphorae, but a whole (albeit small) series of achromatic or black-painted vases with geometric and phytomorphic patterns, offering a fairly broad morphological spectrum including trefoil *oinochoai*, jugs, *lebetes*, *kotyliskoi*, *lekanides*, *pyxides*, single-handled bowls and *aryballoi*. These vessels, which are not documented in any other Po Valley or, more generally, Etrurian center, are evidence of a circuit of exchange due to Corinthian navigation in the Adriatic Sea. This is probably by way of the Epidamni, vital even after the mid-fifth century, whose final outcome will be the attempt of a re-founding of Epidamnos after the crisis of 435. They also witness deeper relationships between Spina and Corinth, which are to be seen in the use of vessels for ointments and miniature *kotylai* in child burials, a practice widely attested in the Peloponnesian city. At the end of the fifth century, other exceptional components are added, like the Boeotians and the Metapontinians. Boeotian vessels, such as a *skyphos* by the Argos Painter from tomb 743 in Valle Trebba and a calyx krater from the same necropolis, appear completely isolated. On the other hand, the bell krater by the Mesagne Painter in tomb 464 in Valle Trebba or the *skyphos* from tomb 564 in the same necropolis, both from Metaponto, are the final outcome of the commercial circuit that in the same years carries figured pottery from the Lucanian factories in Numana and other centers of the Picenian area.³¹⁹³

The limited documentation from fourth-century Adria does not allow us to define a precise framework of this city. However, limited available data seem to indicate a situation substantially similar, with a constant flow of Attic

products to Adria until the third quarter of the fourth century,³¹⁹⁴ coinciding with significant circulation of Athenian coins in the Adriatic, which are documented in Aquileia and Split in the late fourth century.³¹⁹⁵

The control of the routes leading to the grain markets of Spina, Adria, the Adriatic coast and beyond was a major concern for Athens throughout the fifth and fourth centuries. In the changed situation of the whole Adriatic sector one has to note the action of the two Syracusan Dionysius to control the *paralia* by Syracuse and the engagement of Athens in suppressing piracy.³¹⁹⁶ Piracy was popular. In 392, the people of Lipari kidnapped one tenth of the spoils of Veii from the Roman ambassadors who were going to Delphi (Liv. 5.28; Val. Max. 1. 4; Diod. Sic. 14. 93); in 347, Aeginetians made raids against the Athenian ships on behalf of Sparta; in 345, Greeks—and may be Syracusans—were the pirates who infested the sea from Antium to the Tiber (Liv. 7.25.26). The phenomenon was attributed to Etruscans in late classical Athenian literature and propaganda. The speeches by Hyperides in the *ekklesia* of Athens (*Peri phulakés Tyrrhenon*) and Dinarco (*Tyrrenikòs lógos*) are little more than titles to us. It seems no coincidence, however, that the monument of Lysikrates (erected in 334 at the theater of Dionysos in Athens) projects in the myth of Dionysos and the Tyrrhenian pirates the episode of the navarch Diotimo, which in 335 performed with great success an expedition against the *leista* (IG II 2, 1263). The Etruscan piracy had considerable size during the second half of the century, and was not limited to the Adriatic district: Postumius, who ran the sea with twelve ships and appeared in the harbor of Syracuse to offer his services to Timoleon in 339 (Diod. Sic. 16. 82) was probably Tyrrhenian. However, Athens was primarily concerned by the Adriatic sector, so much so that in 325, it established—by decree—the foundation of a colony, then unrealized, *eis Adriav* to ensure *phulake Tyrrhenon*.

3Greeks in Etruria

The Tyrrhenian area appears very different, both because of the social structure of the Etruscan cities and the international political balance in the middle and lower Tyrrhenian Sea.³¹⁹⁷

Stably integrated Greeks are also known in the Tyrrhenian Etrurian cities. They were mostly metics. One was the potter Metron, which changed his name to Metru in Populonia, painted vases in the style of classical Athens and most likely was buried in the city near the Gulf of Baratti (*ET* Po. 6.1 and *ET* Po. 0.2). Another was Deiakos, documented by the graffito on an Marseille amphora at the end of the fifth or early in the fourth century, that became Teace in Etruria (*REE* 2001, no. 22). There were also women, like Thanchvil at Vulci, who wrote her name at the bottom of an attic red-figure *oinochoe*

dating to the third quarter of the fifth century (*ET* Vc 2.33–2.34; *CIE* 11178). This phenomenon also affects other levels of society. In fact, the woman buried in Populonia with the rich set including the two extraordinary *hydriai*—one with the myth of Adonis and the other with that of Phaone³¹⁹⁸—is likely Greek, or better Athenian. Someone who was certainly a Greek was Polles, who moved to Cerveteri around 400, changed his name to Pule, assumed the first name Laris, and was the ancestor of the *gens* of the Laris Pulena (*CIE* 5430), one of the most important families of Tarquinia in the Hellenistic age.³¹⁹⁹ As in the cases of Spina mentioned above, the graves with three attic white ground *lekythoi* known from the necropolis of Monterozzi can be connected to Greeks moved to Tarquinia.³²⁰⁰

4Attic Pottery in Etruria

The fracture of equilibria caused by the Syracusan attack on Elba and Corsica is reflected in the Athenian presence in the northern Tyrrhenian, documented by the influx of Attic pottery in this area. The general decline in the number of imports also has its origins in the changed domestic situation in Athens after the Persian War and the transformations that marked both its productive activities, society and ruling classes in Athens after 480/479. It does not seem a coincidence that the entire Tyrrhenian Etruria, from Caere to Pisa, from Aléria to Chiusi and Orvieto, during the second half of the fifth century, is totally excluded from the circulation of Athenian coins. The only exception is the small hoard of *tetradracmai* of 450/440 found in the sanctuary of Pyrgi and the isolated *tetradracmai* of Telamon and Chiusi. However it is true that after 450, the decline in the importation of Attic pottery affects not only the centers of the southern coastal sector, but also those of the Tiber district. Compared to these areas, there is less recession in the northern area, in the mining district marked by two poles of Aléria and Populonia and in the grain market of Pisa and in Arno Valley.³²⁰¹

A detailed census of Attic pottery in single cities is still lacking. Reconstructions proposed to date are mainly based on John D. Beazley's lists, which are partial and in need of updates due to the discoveries and recoveries of the last fifty years, and the appropriate integration with data on the number of black glazed pottery. Upon an initial examination, it seems that the black glazed vases did not have particular success, limited to a rather small number of specimens. The red-figure vases were still quite widespread. The examination of various workshops shows that the vessels of the atelier of the Eretria Painter were diffused in Veii, Caere, the Tolfa district, Tarquinia, Vulci, Aléria, the area around Volterra (Ortaglia near Peccioli), Pisa, and in the inner district of Orvieto and Chiusi, in addition to Falerii and Todi (Fig.62.1). *Kylikes* of the Kodros Painter arrive in Tarquinia, Vulci, Orvieto

and its territory, Populonia, the district of Fiesole in the Arno Valley, the area around Lucca inland from Pisa, Falerii and Todi. Vases by the Painter of Berlin 2536 also reached the territory of Arezzo, as documented by the fragmentary specimen from Castiglione Fiorentino. Vessels by the Marlay Painter are known in Tarquinia, Gravisca, Vulci, Orvieto, Chiusi and its territory, Roselle, Populonia, the territory of Volterra (Ortaglia near Peccioli in Val d'Era, San Martino ai Colli in Val d'Elsa), and in Fiesole. *Skyphoi* from the *ergasterion*, in which the Penelope Painter was active, are known in Tarquinia, Gravisca, especially in Orvieto and Chiusi, where this shape appears to have had a remarkable luck. An examination of the vessels referred to the Schuwalow Painter provides a similar framework: they are represented in Caere, Tarquinia, the area around Viterbo, Vulci, Populonia and in the ager Faliscus in Narce and Falerii. Beyond the quantitative data, the distribution of the vessels of the mature classicism style marked by a high quality is important. This includes the circle of Meidias and, more generally, the pottery painters influenced by the decoration of the Parthenon. There are only a few vases by the Meidias Painter present in Vulci, Orvieto and Populonia—all marked by great individuality both in shape and in the painted images—while works by his entourage are also known in Veii, Caere, Roselle and Pisa; *kylikes* forged by Erginos and decorated by Aristophanes are attested in Tarquinia, Gravisca and Vulci.

The circuits of this *emporion* show Attic characteristics, even if in all likelihood there was a simultaneous presence of *emporoi* and *holkades* from Sicily, as we can see from the circulation of Sicilian coins in southern Etruria in the last decades of the fifth century. Two such coins are small *emilitrai* found in Tarquinia, one minted by Himera in 413 and the other issued by Agrigento in the years immediately preceding the conquest by Carthage in 406.³²⁰² Another component, for the end of the fifth and the first decades of the fourth century, was the Campanian region, as we can see from some significant materials, such as, for example, the silver fibula of Samnite type from the Satie tomb of Vulci.³²⁰³

The situation changes dramatically from the late fifth century, when on the entire southern coastline, the importation of Attic pottery seems to stop, as confirmed by the case of Tarquinia and Gravisca sanctuary. There the presence of Attic vases runs out in the years around 400, since during the fourth century there are merely isolated black glazed pieces from the city and the sanctuary at the *epineion*. Only a rare few pieces are known from Vulci in the fourth century, such as the *kylix* by the Jena Painter, or a *skyphos* by the Fat Boy Group.

Fig. 62.1: Distribution of the Attic red-figured pottery in Etruria, late 5th cent. BCE 62
External Relationships, 450–250 BCE

Fig. 62.2: Distribution of Attic red-figured pottery in Etruria, 4th cent. BCE

The situation in the northern district is truly different, in the coastal sector of the mining center of Populonia, in the area of Pisa, in inland areas from

Volterra to the middle valley of the Arno River, to the Chiusi area. In northern Etruria, red-figure Attic pottery is documented until the third quarter of the century, sometimes by pieces of outstanding quality in Roselle, Vetulonia, Populonia, Elba, Aléria, Pisa and its territory (Bientina), Volterra and its territory (Ortaglia near Peccioli, Palaja in Val d'Era), Fiesole and Chiusi.³²⁰⁴ (Fig. 62.2) The highest concentration is in the mining district and around the center at the mouth of the Arno River, but the wealth of findings of Ortaglia near Peccioli in Val d'Era suggest that the relative shortage of specimens should be attributed more to a randomness of findings than to a real historical contingency.³²⁰⁵ The fact that the area of Populonia has a high number of findings parallels the development of the economic structures of the city. The strength of the city is indicated by the movement of its coins, which reach Elba and Aléria, Vetulonia, Roselle and Tarquinia on the coast to the south, Chiusi and the interior region of Umbria (Valle Fuino of Cascia), the area of Fiesole (Prato) and Pistoia (San Marcello) to the north, and finally Prestino in the Lepontic territory near modern day Como and the far west of the area around Tarragona, north of the mouth of the Ebro River in the Iberian peninsula.

5Epilogue

The capture of Capua by Campanians in 423 and the allocation of the Samnites in the Nolan and Picentinian countrysides mark the end of the Etruscans in Campania. The disruptive effects of the arrival of the Gauls in the Po Valley and the subsequent crushing of the system closes the era of the Etruscan control of that region. From that time, the Etruscans were relegated to the districts of Mantua and Spina. The Etruscan world is thus enclosed within the boundaries that will mark Etruria in the administrative division of the Augustan *regiones*. Rome was going to destroy Veii in 396, and Syracuse was a threatening presence in the early decades of the fourth century—both in the Tyrrhenian Sea (where Dionysius the Elder would plunder the sanctuary of Pyrgi in 384) and in the Adriatic Sea (where he founded a series of coastal colonies and *phrouria* from Adria to Ancona). Within the framework outlined by these events, the political structure of the Etruscan world elaborates a profound transformation of social geography and geometry, which has different methods and timing in various districts of the region. In Caere, there was a revival of tyrannical forms, as confirmed by the figure of Orgonius. He was ousted by an expedition led by Aulus Spurius from Tarquinia, which is attested by a Latin inscription found near the Ara della Regina at Tarquinia,³²⁰⁶ while in other cities the oligarchic group maintained its position, even if reshaping the political forms in a new and different relationship between city and territory.

During the fourth century, other circuits appear between Tyrrhenian Etruria and Magna Graecia, as documented by some rare Apulian red-figure and overpainted pottery found in Pisa, Volterra, Populonia, Aléria, Chiusi, the district of Perugia (Mandoletto), Sovana, and perhaps Vulci, Tarquinia, Tuscania, Caere and Falerii (Fig.62.3).³²⁰⁷ There are also attestations of Apulian pottery from Spina, but they have to be seen in connection with the problems of Syracusan expansionism in the Adriatic Sea and the political attitude towards Taranto by the two Dionysii.³²⁰⁸ The traffic of pottery, however, is only one aspect of the trade, which also involves other categories of objects, such as jewelry and gold for the various members of the oligarchy, and the movement of metics and artisans, such as *Apol(---)*³²⁰⁹ who, like *Sokra(tes)* in Falerii, writes his name on the bottom of a small red-figure *oinochoe* from Caere of the late fourth century.³²¹⁰ There was likely a Tarantinian influx in the figurative culture of Early Hellenistic Etruria,³²¹¹ which regards both the pictorial art, in megalography (see the Tomb of the Garlands of Tarquinia³²¹²) and vase painting (see the vessels of the Hesse Group³²¹³), architecture and sculpture, and jewelry production. The circulation of coins from Magna Graecia has some exceptional specimens,

like a bronze coin from Metaponto in Tarquinia, or two *didracmai* from Taranto in Montefiascone, with a special relationship with Neapolis and Campania in general.³²¹⁴

However, the late classical and early Hellenistic ages saw the reactivation of Etruscan *emporia*, with the spread of products from the workshops of Caere, Tarquinia, Vulci and Populonia in the northwestern Mediterranean Sea. The Faliscan products were sold in the same area, due to the alliance between Falerii and Tarquinia during the years of the war between Tarquinia and Rome in 358–351.³²¹⁵

Fig. 62.3: Distribution of red-figured pottery from southern Italic fabrics in central and northern Italy 62 External Relationships, 450–250 BCE

In 299, the inhabitants of Delos were still forced to borrow five thousand drachmas of the temple treasury in order to protect themselves from

Tyrrhenian pirates (*IG* XI, 148, 73–74), whose actual provenance is uncertain. In the following years, the progressive appear of Rome in Etruria will mark the beginning of the slow decline of Tyrrhenian Etruria's dynamism. Etruria, taking advantage of the consolidation of the political axis between Rome and Marseille and its economic results for trade in the second half of the century, will prosper during the early Hellenistic period, with wide relationships and commercial circuits, in which there were components from Etruria itself, the Faliscan area, Latium and Campania. In the Adriatic side, with the renewed interest shown by Agathocles of Syracuse, after the African expeditions of 310–307, there is a significant presence of some vessels from the Syracusan factories, mostly affecting the network of local traffic. In the late fourth and early third centuries, it is more difficult to understand the reason for the presence of some Messapic *trozzelle* in Spina and Populonia.³²¹⁶ The intimate relationship of this shape with the Messapic funeral ideology and with the female world are mute clues of relationships between some Etruscan communities and the dynamic society of Messapia in the last three decades of the fourth century and the first decades of the third, probably through marriages. As the contours of the problem escape a more precise definition, it is not a chance that the phenomenon can be seen in Spina and Populonia, the two main poles of attraction for the international trafficking of two Etruscan seas, the Adriatic and Tyrrhenian.

IV. Civilization

Etruria and Rome

Fernando Gilotta

63Art, 250–89 BCE

Abstract: This chapter deals with developments in Etruscan culture from the Middle Hellenistic period to the final conquest of Etruria by the Romans. The long phase of artistic prosperity that lasted until the first half of the third century appears fatally destined to break up with the progress of Roman expansion, which gradually leads on the one hand to the total absorption of the major Etruscan towns, and on the other to the conquest of Western Greek towns of the size of Taranto, essential partners of the Etruscans in the artistic as well as in the religious and philosophical fields. On the specifically architectural side, traditional plans of Tuscanic or *oikos* type alternate in major temple buildings with more advanced types, clearly inspired (second century) by scenographic models of Hellenistic origin well known in Latium and central-Italic area. Sculptural monuments seem to proceed from a classicizing language still inspired by Early Hellenistic features of Western Greek imprint (second half of the third century) to an “Asianic” (mainly Pergamene) style, full of pathos, plasticity and intense dynamism, spread throughout central Italy—with Rome as intermediary—in the first half of the second century as a result of Roman expansion in Greece and the Eastern Mediterranean. In funerary (once more, mainly Tarquinian) wall painting, the most frequent subjects are the journey in the Netherworld and magistrates’ processions, where a great space is given to civic-social features, such as commemorative inscriptions, or the visibility of the insignia of power: these magistrates’ processions provide us with a “physical” picture of the last Etruscan urban aristocracy prior to Romanization. After the middle of the third century, the secular tradition of funerary painting dies out in Etruria, paralleled by gradual social and cultural destructuring of the country.

Keywords: Architecture, painting, sculpture, Hellenism, elites

1Architecture

The long phase of prosperity that lasted until the first half of the third century appears fatally destined to break up with the progress of Roman expansion, which gradually leads on the one hand to the total absorption of the major Etruscan towns, and on the other to the conquest of Western Greek towns of the size of Taranto, which were essential partners of the Etruscans in the artistic as well as in the religious and philosophical fields. A direct consequence of these major events is the drastic reduction of building and artistic activity.

To the Middle Hellenistic period belong the two temples on the acropolis of Volterra, housing cults similar to those of Dis Pater and Demetra. The rectangular Tuscanic ground plan of the older one (B), dating to the third century, is divided into *pars antica* and *pars postica*, with a triple row of four columns in front, and curiously echoes Late Archaic models of the Caeretan

area, suggested perhaps by the close ideological-religious copying of the previous building (also Tuscanic) which rose close by, or from a desire to follow “national” architectural tradition at a time when the Roman threat was increasingly imminent. The more recent temple (A) on the other hand, with its fairly elongated ground plan, two columns in front, compared to the temple of the Magna Mater on the Palatine in Rome, was built around the mid second century, on the eve of total integration within the Roman sphere, and appears to belong to a remodeling of the sanctuary inspired by Middle Hellenistic scenographic *Vorbilder*, well-known in Latium.

The old *oikos* type is the model for the Hellenistic edifice (third century) of the sanctuary at Poggio Casetta, outside the town of Bolsena. It has a simple rectangular ground plan, with two pillars that appear to divide the back wall, and is arranged inside a *temenos* in a manner that also has archaic forerunners in Etruria. Very recent is the discovery, again at the Bolsena Lake, but on the southern shore, at Piana del Lago, of a rustic sanctuary, with *temenos* provided with porticos, inside which were probably two small sacred edifices with different orientations. One of these may possibly have had a *cella* with two *alae*, utilized at least from the fifth century to the Hellenistic period. Still uncertain are the layout of the complex and the identity of the cult or cults, but the typological-structural similarities with Poggio Casetta are certain, as is the strategic value of the site, at the confluence of several communication routes between the territories of Orvieto, Vulci and Tarquinia.

In concluding this brief review, we must mention a structure that is exceptional in Etruria for its typology and monumental status: the major extra-urban sanctuary at Castelsecco (Fig. 63.1), located on a hill that dominates the town of Arezzo from the southeast. Dating to the Middle Hellenistic period and probably abandoned at the time of Silla, it possesses a large terrace supported on the south side by a mighty and scenographic retaining wall provided with buttresses. On the terrace stand a small theatre building and the temple itself. In some ways they recall, even with the overall autonomy of the layout, the major sanctuaries in Latium and central-Italic area; clay ex-votos and an inscription discovered in the area seem to point to cults (of a popular nature) of a deity of fecundity and childbirth and of Tin/Juppiter. The dimensions and architectural details are well-suited to the flourishing economy of a town like Arezzo, whose production and trading role experienced no decline with Roman expansion and with the opening of new routes to northern Italy (Bologna) and toward Rome itself.

Fig. 63.1: Castelsecco (Arezzo), sanctuary, aerial view. Hellenistic period (after Maetzke 1982–84, fig. 1)

As far as dwellings are concerned, we find most noteworthy *domus* with *atria* (but perhaps without *tablina*) at Vetulonia, some of which feature rich architectural terracottas (e.g. the so-called Casa di Medea). They were built during a period of imminent Romanization in the Hellenistic area of Poggiarello Renzetti (late third–second century), as well as at Costa Murata, and their ground plan, albeit conceived to adapt to the impervious nature of the site, is not without comparison in the Roman-Pompeian milieu.

2Sculpture

From the beginning to the middle of the third century, we can date a series of major sculptural monuments – both votive and architectural – from the Etrusco-Latinal area. Compared to what we observed in the Scasato I cycle, these monuments appear to mix experiments of Early Hellenism with classicizing traits to an increasing extent. The main references of this artistic language can be once more found in contemporary Greek sculpture. Among the better-known examples are the *sima* (?) with Dionysiac reliefs from Caere, some of the terracotta statues of female deities from Ariccia (Latium, Alban Hills), and minor objects like relief-vases or appliqués for cinerary urns. These are linked to Dionysiac and Demetriad cults of unequivocal Greek and Western Greek origin, which appear to have been responsible for introducing

this type of stylistic language into the Middle Tyrrhenian world.

Further north, between the first half of the third and the start of the second century, a return to the practice of inhumation supports the spread of stone sarcophagi at Chiusi. Both the position of the deceased on the lid, and the subjects and compositional arrangements of the figured reliefs decorating the box reveal inspiration from southern models, especially from Tarquinia. It is probable that this can be attributed to craftsmen from Tarquinia, who settled in northern Etruria in the early decades of the third century, following the outright conquest of southern Etruria by Rome. The quality of the faces of the deceased – which incorporate nuances of the best Early Hellenistic sculpture and portraiture – is fairly high in the specimens datable up to the mid third century. Specimens from the following decades appear to incorporate elements of a more sober and measured plasticity, to a certain extent similar to what happened in southern Etruscan and Latial contexts. The Clusine sarcophagus of Thania Sentinati Cumerunia at the Louvre, which dates to the second half of the third century, is undoubtedly of an exceptional quality. The dreaming melancholy in the face of the deceased and the vibrant surfaces, that in some ways can be compared to the terracotta statue of the so-called Ariadne of Falerii, confirm the syntony between southern and northern areas (particularly in the Tiber Valley axis) of the Etrusco-Italic region and the still considerable creativity in the decades leading to or immediately after the start of the Roman conquest.

These monuments end the age of Late Classical and Hellenistic *koiné*. Not until the onset of the second century, after the end of the war with Hannibal, would a new cultural crossroad arrive. This was triggered by the spread of works of art and craftsmen throughout central Italy as a result of Roman expansion in Greece and Eastern Mediterranean. Thanks to Rome's presence in the lands it had conquered (in the south), or in some way under its control (in the north), the Hellenistic language that blossomed in the courts of Asia Minor – first and foremost at Pergamon – pervaded Etruscan full-relief and relief sculptures, destined for temples, private buildings, tombs, and cinerary urns. Full of pathos, and made with remarkable plasticity, these sculptures feature intense dynamism and facial features that suggest violent or sorrowful events (whether mythical or not), in narrative contexts of both public and private kinds. Excellent examples are found in the now thoroughly studied cinerary urns from Volterra, Chiusi, Perugia (see [chapter 64](#) de Angelis), and in reliefs belonging to temple pediments and friezes, as well as to houses, at Vulci, Sovana, Chianciano, Vetulonia, Populonia, and again Volterra, to name only the main cities. These finds often feature Dionysiac and other mythical themes, sometimes celebrating the origins of the town itself, and are mostly datable to between the end of the third and the first two thirds of the second century. Worthy of a special mention are the architectural terracottas from the Catona cycle at Arezzo and those belonging to the pediment of the renewed temple at Talamone, both dating to no later than the first half of the second

century. The former (Figs. 63.2.–63.3) – their subject uncertain (maybe including a Judgment of Paris?), but of exceptional quality – appear to contain traces of the best coroplastic traditions of the third century, together with new hints from Middle Hellenism of Asianic origin. The latter, with their pictorial and theatrical (Seven Against Thebes) features now fully in line with contemporary Middle Hellenistic canons, celebrate a “righteous destiny” and condemn *hybris*, perhaps in the new atmosphere of coastal Vulci territory under Roman control.

Fig. 63.3a–b: Terracottas from the Catona Sanctuary (Arezzo). Hellenistic period. Arezzo, Museo Archeologico Nazionale. (Photo SAT)

Metaphorically closing this section, we must mention the Arringatore, a prestigious votive and honorary bronze statue discovered in the area of Cortona, portraying the nobleman Aule Meteli – with a dedicatory inscription on the toga to the god Tece Sanś – whose problematic portrait appears to be in syntony with Etruscan and Late Republican Roman sculptural developments that cannot be dated earlier than the second half of the second century.

After this time, a largely Romanized Etruscan society no longer provided outstanding clients and was no longer capable of producing major monuments in the wake of its own varying regional plastic traditions.

3Painting

In view of the controversies about absolute chronology relating to tombs of the end of the fourth-third centuries, we shall here take all Hellenistic monuments together, thus avoiding the “rule” of chronological divisions which could appear over-precise. Debate on this subject has been quite heated over the past few decades, but has now led to a more solid definition of the evidence for the period, thanks to a wider range of cultural references, both inside (sarcophagi and their epigraphic apparatus, contemporary painted pottery) and outside (Macedonian painting) the Etruscan world.

Let us, however, take a closer look, starting from the “containers” of the

paintings. During this period, chamber tombs tend to lose the double pitched roof so characteristic of previous phases, in favor of a flat roof. The funerary chambers are bordered with benches and sarcophagi for depositing the deceased. Paintings decorate not only the walls, but also the benches, sarcophagi, ceilings and pillars. Frequent too are friezes – both long and short – with small-dimension figures or ornamentation, while the differentiation of the location and size of the paintings often points to a differentiation in compositional vocabulary and drawing tools. The most frequent subjects are some of the themes widely established during the fourth century: first and foremost the journey to the Netherworld and the magistrates' processions, although the scenes now evidence numerous novel elements and greater space is given to "civic-social" features, such as commemorative inscriptions, or the visibility of the insignia of power.

At the top of the series of Hellenistic tombs we may consider the Giglioli Tomb at Tarquinia, dated to about 300, its walls dominated by a great frieze of weapons. Its solid perspective is achieved by the skilful use of thickening or overlapping and the graded veiling of color, which provides plasticity, brilliance, light and shade to the objects: highly effective, in particular, is the rendering of the bronze cuirass and 63 Art, 250–89 BCE Thracian helmets. The weapons, as well as the emblems of power, depicted in this extraordinary display, in some way constitute an ideological manifesto of the family owning the tomb and of the whole late-Etruscan aristocracy. Judging from the *episemata* of the shields depicted, which match those on contemporary coins of Tarquinia, we might be led to infer that the owners of the tomb were indeed directly involved in "public" initiatives of this major Etruscan town, perhaps even in the frequent clashes of the period with Roman military might. Hints of a similar use of weapon friezes in funerary contexts with strong aristocratic connotations are already in the Tomba dei Rilievi (Tomb of the Reliefs: [Fig. 63.4](#)) at Caere (second half of the fourth century: see [chapter 57](#) Gilotta), the other major southern Etruscan town, in which the weapons accompany the portrayal of furnishings, objects of ceremonial and daily use suited to the eminent members of a wealthy gens. Significant possibilities of comparison for the subject in different contexts – albeit of the same level of acculturation and social organization, such as southern Italy, Macedonia and northern Greece – lead us to suspect that also in this specific field of funerary ideology Etruscan clients largely participated in the formal and ideological *koiné* penetrating the Hellenized aristocracies of the central and eastern Mediterranean.

Between the end of the fourth and the mid third centuries, in the period immediately preceding and accompanying the Roman conquest of southern Etruria, many painted Tarquinian tombs stand out for representing – sometimes in an absolutely dominating position within the funerary chamber – friezes with magistrates' processions aimed at celebrating the rank and high public office of the deceased. Often portrayed in tunic and toga, and

accompanied by bearers of *insignia* and musicians, the magistrates are seen in the context of a still independent civic life. The processions, frequently accompanied by inscriptions bearing names and/or explanations, while evidently based on the customs of everyday life, never manage to become historical in any real sense (i.e. with references to specific events in the life of the deceased). Instead, the scenes maintain what we may describe as a figurative *apotheosis* – of a magisterial, familial and funerary nature all at once – as also shown by the occasional insertion of funerary daemons among the participants (e.g., Bruschi Tomb, Tomb of the Typhon). The most ancient of these tombs – the Bruschi Tomb and the Tomba del Convegno (probably beginning of the third century) – follow the line of experiments already substantially found in wall- and vase-painting of the last decades of the fourth century, owing both to the presence of single antiquarian details and to the use of color, as well as for the sound pictorial technique used for the features of the various characters. The Tomba del Convegno (Fig. 63.5; Colour plates 42–47) is especially rich in detail in its procession scenes, which are displayed on the left and back walls. These appear to exalt the magisterial role of the personage commemorated – who achieved the important office, perhaps exceeding the circle of a single town, of *zilaχ cexaneri* (see chapter 9 Tagliamonte) – by representing *apparitores* bearing *insignia* of power such as *fascēs*, double-axes, spears, perhaps even suggesting that the protagonist took an important part in the military enterprises that would lead to the Etruscan town's falling under Roman control. The Tomb of the Typhon (Colour plate 48) is decorated with similar subjects, and may be only slightly more recent, as shown by a cross-comparison with specimens of Greek Early Hellenistic art and a comparison with other painted Tarquinian tombs (e.g. the Tomb of Festoons), which have already (and with greater certainty) been dated to the beginning of the third century (cf., e.g., the Typhon on the pillar with the Charun beside the entrance in the Tomb of the Festoons, both Etruscan interpretations of a still substantially Early Hellenistic pictorial technique). The pictorial texture of the figures employed in these thronged processions, thin and wholly wrapped in wide garments with sparse and linear folds, does not seem to derive from any Roman historical-triumphal pictorial language, as has been suggested, but appears, yet again, to follow the developments of painting and vase-painting in Greece, Magna Graecia and Etruria itself. At the same time, it satisfies the formal and rhythmic requirements of a celebratory repertory, involving all the Hellenized elites of the Mediterranean, and focusing on the ritual cadences of crowded processions, triumphs, and apotheoses, for either family or funerary purposes.

Fig. 63.5: Tarquinia, Tomba del Convegno: procession of togati. First half of the third century (photo † G. Bellucci) 63 Art, 250–89 BCE

Beside the magistrates' processions – which provide us with a “physical” picture of the last Etruscan urban aristocracy prior to Romanization, the painted tombs display widespread familiarity with developments in Hellenistic painting. Miniature decorations, like those of the lacunars on the ceiling of the Tomb of the Festoons, with marine creatures and putti on a dark background, are sophisticated expressions of genre painting and of a *pittura a macchia*, whose best antecedents are found in Macedonian and Tarantine specimens, and seem comparable to the frieze with battle scenes on the capital of the pillar in the Tomb of the Cardinal. No less valuable are the contemporary, but technically different, pictorial documents in several tombs with funerary chambers on two levels. To the sides of the entrance door of the Anina Tomb and the Tomb of Charuns, for example, we find male and female daemons (Charun or Vanth) who accompany the deceased and act as authoritative custodians of the passageways in the journey to the Netherworld. They are characterized by great dynamism, thanks to a skillful and rapid use of brush-strokes in rendering hair and disarrayed garments and the addition of white to indicate areas more exposed to light. Here too, sound terms of comparison are found in the wall paintings, cyst-tombs, and painted *klinai* of the Macedonian area, confirming the high degree of technical innovation achieved by Etruscan craftsmen.

Among the later tomb paintings – perhaps the very last prior to definitive cultural assimilation by the Roman world – we should point out those of the Tomb Querciola II and Tomb 5636, both of which were found at Tarquinia and date to the mid/third quarter of the third century. In an extremely simplified style, we find scenes of farewell and meeting before the gates of Hades, portrayed almost like city gates –closed, with a fully-rounded arch and details of both wings – presided over yet again by an infernal daemon (Charun). After this, the secular tradition of funerary painting dies out in Etruria, paralleled by gradual social and cultural destructuring of the country.

64Handicraft, 250–89 BCE

Abstract: Etruscan handicraft in the middle and late Hellenistic age is commonly—if mostly implicitly—perceived in terms of decline. Indeed, several classes of artifacts typical of the production of the late Classical and the early Hellenistic periods either ceased to be made or experienced dramatic decreases in quality during this age. Whether one considers wall paintings in tombs, the stone sarcophagi of southern Etruria, engraved bronze mirrors, bronze candelabra and incense-burners, red-figure vases, the “silvered” vases from Volsinii or the black-gloss Malacena ware from Volterra, the discrepancy—and sometimes the radical contrast—between the vitality and variety of the fourth and early third century and the monotony from the mid third century on is blatant. While the data on which such a picture is based are largely correct, the picture itself is incomplete and therefore potentially misleading in more than one respect. The most obvious dimension to consider alongside interruption and break is that of continuity and duration. All productions were not discontinued and qualitative decline was not a universal phenomenon: witness bronze sculpture or architectural coroplastics. Nor should one downplay the role of innovation. New classes of objects as well as new shapes and themes came up precisely during the middle to late Hellenistic age. The development of late Etruscan handicraft is not a unilateral phenomenon. It comprises different factors that vary according to local conditions. An adequate picture needs to take this multiplicity into account.

Keywords: Votive objects; coroplastics; statuettes; cinerary urns; sarcophagi

Introduction

Etruscan handicraft in the middle and late Hellenistic age is commonly—if mostly implicitly—perceived in terms of decline. Indeed, several classes of artifacts typical of the production of the late Classical and the early Hellenistic periods either ceased to be made or experienced dramatic decreases in quality during this age. Whether one considers wall paintings in tombs, the stone sarcophagi of southern Etruria, engraved bronze mirrors, bronze candelabra and incense-burners, red-figure vases, the “silvered” vases from Volsinii or the black-gloss Malacena ware from Volterra, the discrepancy—and sometimes the radical contrast—between the vitality and variety of the fourth and early third century BCE and the monotony from the mid third century on is blatant. While the data on which such a picture is based are largely correct, the picture itself is incomplete and therefore potentially misleading in more than one respect. The most obvious dimension to consider alongside interruption and break is that of continuity and duration. All productions were not discontinued and qualitative decline was not a universal phenomenon:

witness bronze sculpture or architectural coroplastics. Nor should one downplay the role of innovation. New classes of objects as well as new shapes and themes came up precisely during the middle to late Hellenistic age. The development of late Etruscan handicraft is not a unilateral phenomenon. It comprises different factors that vary according to local conditions. An adequate picture needs to take this multiplicity into account.³²¹⁷

As with all other spheres of Etruscan society and culture of this time, the features of craftsman production can only be properly understood and assessed by giving due weight to Etruria's relationship with Rome.³²¹⁸ The role of Rome manifested itself in a variety of ways. Some were spectacularly disruptive, and others were less so, but were more pervasive and durable. For example, an event like the capture and destruction of Volsinii in 264 BCE certainly affected handicraft in more than one way. On a very basic level, it entailed a massive relocation of artifacts, as suggested by Pliny the Elder's reference to the 2,000 bronze statues that were brought to Rome as part of the booty (Plin. *HN* 34.34). Moreover, it caused a diaspora of artisans and a reconfiguration of their workshops. Quite significantly, C. Lapius—a second-century artisan probably of Volsinian descent and the maker of mold-made relief vases belonging to the category of the so-called Italo-Megarian ware (which was produced and sold in Etruria and elsewhere in central Italy)—signed several of his products in Latin and only occasionally added the Etruscan version of his name, Lapie.³²¹⁹ Finally, and correspondingly, the catastrophe that befell the city altered the social fabric that underlay patronage and customership patterns. It is not coincidental that production of objects such as mirrors, which had traditionally played an important role in shaping social relationships in Volsinii, experienced a radical rupture with the resettlement to the new center of Volsinii Novi.³²²⁰

As dramatic as events like the destruction of entire cities might have been, however, one should not overestimate their relevance. Even in the case just mentioned it is possible to find clear instances of continuity. For example, the Bacchic terracotta throne as well as the vessels and tiles bearing the stamp of Avle (?) Fuflluns found at Volsinii Novi suggest that the relocation of coroplastic and ceramic workshops did not affect production in only a negative way.³²²¹ Consequently, the general conditions created by Rome's expansion—not only in Etruria itself but also, more generally, in Italy and the Mediterranean basin, particularly after the Hannibalic wars in the late third century—are just as important as these ultimately episodic events in order to understand the development of handicraft in late Etruscan history.³²²² Rome's conquests led to the establishment of new and broader commercial and cultural networks, with wide-ranging implications for handicraft. The absence of developments carries as much weight as their actual occurrence. For example, the fact that on the whole, the Etruscan ceramic industry—as opposed to the Neapolitan producers of the widely exported Campanian A ware, or the ceramic workshops of Cales—did not take advantage of this new

situation and modify the organization of workshop production to expand its outreach is no less meaningful than its reception of formal and typological innovations at the turn of the third century.³²²³ On the other hand, the varying nature and intensity of Rome's role in Etruria—through the destruction of cities, the foundation of colonies, and the occupation of the *ager* and establishment of alliances—created different local conditions that were roughly dependent on the degree of proximity to the *Urbs*. In particular, distinctions between southern and northern Etruria were further emphasized and acquired a new character thanks to the new political situation and the different typologies of power relationship it entailed.

1 Southern Etruria

The developments in the south, where Rome's presence was particularly palpable, did not always entail the disappearance of workshops or a lower output of artifacts. On the contrary, in many cases the volume of production increased or stayed the same. Occasionally, the Roman presence might have even boosted local handicraft, as suggested by the case of the temple of Talamone, whose remarkable architectural decoration was due to the same workshops operating in the nearby Latin colony of Cosa.³²²⁴ Even in those instances where discontinuity is indeed attested, production did not always come to an immediate halt. Thus, bronze incense-burners continued to be made in Tarquinia, albeit in simplified form (the so-called “Curunas type”), at least until the beginning of the second century.³²²⁵ Finally, one should not underestimate the role of euergetism. Even under modified circumstances, public construction continued to be an important catalyst for specialized workshops, such as the one that produced the mosaic floor bearing the names of the patrons Avle Alethnas and Luvce Hulchnies in the late second-century baths of Musarna—significantly, a recent architectural typology that was becoming increasingly popular in Rome-dominated Italy.³²²⁶

In many cases, the main change concerns the increasing divide between the higher and lower ends of the qualitative spectrum. High-quality products seem to occur more sporadically than in the past. They thus do not create a critical mass or represent any more a term of reference for the broader output. As a consequence, not only is the overall rate of innovation and change quite low, but local production can yield to imports from outside. For instance, black-gloss ware is often imported from northern Etruria and Campania in the second century, and many of the Italo-Megarian vessels found in Etruria can be attributed to workshops based elsewhere, such as those of C. Popilius in Umbria.³²²⁷ Moreover, wherever specifically Etruscan production is attested, it is strongly localized. Workshops cater almost exclusively to local needs and markets. Circulation of locally produced objects, forms and shapes is attested

among minor centers, as well as between them and the main center, but it rarely trespasses the territory of the main center itself.

A good example of this situation is provided by the production of votive objects. Not all of them are standardized or of low quality. Several of the terracotta objects from the votive deposit of the Northern Gate in Vulci, bronze statuettes like the Fufluns/Dionysos from Vulci, now in the Vatican, and a bronze club, probably from Caere, dedicated to Hercle/Herakles by Tite Utaves (significantly, a freedman, perhaps of northern Etruscan descent), are all instances testifying to the contrary.³²²⁸ But these cases are not widespread and have little echo in more popular local productions, which instead follow their own dynamics and display characteristically southern Etruscan features. Typical offerings for the gods in southern sanctuaries consist of mold-made terracotta artifacts, whose typologies are often connected with the sphere of healing and reproduction. Human statuettes and heads, babies in swaddling clothes, animal figurines, and especially polyvisceral and anatomical votives representing parts of the human body (hands, feet, legs, breasts, male genitals, uteri, eyes, ears, fingers, hearts). None of these features is an innovation of the late Hellenistic period. In fact, they belong to a tradition that ultimately dates back to the late Archaic age and acquires its permanent features in the fourth century, so that it is well entrenched by the time the Etruscan cities lose their independence. Nor are these votives exclusively Etruscan. From early on they partake of a wider cultic *koine*—and a craftsman tradition—that comprises Latium and Campania as well. In other words, these votives do not simply testify to the resilience that is typical of the religious sphere, but also remind us that the geographical location of cities like Caere, Tarquinii, and Vulci (not to mention Veii) had been a relevant factor for handicraft already before the Roman conquest.³²²⁹

This observation is less obvious than it may at first sound. What these phenomena of continuity suggest is that traditional basic patterns persist well into the late Hellenistic period despite the new circumstances, to the extent that some of the main political changes would pass almost unnoticed based on the evidence of votive handicraft alone. The intensification of the Roman presence through colonization and appropriation of portions of the *ager* in southern Etruscan cities did not translate into a drastic modification of local votive practices on the popular level, in contrast with what happened in other regions of Italy, where the diffusion of serially made terracotta dedications, and of the corresponding workshops, is by itself a marker of Romanization for modern scholars.³²³⁰ The adjustments that the new situation required from the artisans were minimal. Among the few examples there is the representation of male figures with veiled head, *Romano ritu*, rather than bareheaded. As crucial as this detail is in regard to ritual, it only requires a technically and visually slight change. In many instances, the veil is not really represented but only alluded to in a rather abstract way through an extended rim around the head. Moreover, veiled and unveiled heads coexist in the same sanctuaries,

albeit with varying ratios, and are made in the same workshops.³²³¹ In this domain at least, the Roman conquest apparently did not affect the production or the organization of craftsman labor in any significant way.

At the same time, this continuity is also characterized by a lack of innovation and repetitiveness. This has less to do with the serial character of late Etruscan handicraft *per se*, since the use of molds had been a typical feature of the production of votive objects in southern Etruria already in the Classical period. The point is rather that after the early third century very few new archetypes were created, and most objects were the outcome of second- and third-generation molds, i.e. molds that were produced using the previous mold-made artifacts as prototypes. This procedure inevitably led to a degradation of the formal traits of the objects, as well as to a steady reduction of their size, as can be seen in a paradigmatic way with the votive heads from the rural sanctuary of Tessennano, near Tuscania.³²³²

Comparable trends can be observed in other realms as well, such as the funerary sphere. The sepulchral markers of a city like Caere in the period under consideration are quite inconspicuous, as they mostly consist of plain columnar or roughly house-shaped *cippi*.³²³³ Similarly, the production of decorated stone sarcophagi and of painted tombs that had characterized the burials of the members of the elite in Tarquinia dies out soon after the second half of the third century. Interestingly, it is the workshops of terracotta sarcophagi in a center of the Tarquinian territory such as Tuscania that continue to thrive into the second century (Fig. 64.1), attesting to the increased visibility of the countryside and the role of the upper members of local societies as supporters of handicraft.³²³⁴ Tellingly, however, these monuments are serially made—in fact, there are clear links with the production of votive artifacts—and conform to few standard types. Except for some early examples of individually rendered portraits, there is no significant interest in variation or innovation. The production processes and techniques of the workshops evidently echo the patrons' wish to demonstrate status through adherence to shared ideals rather than competitive distinction. A monument like the one featuring Adonis reclining on his death-bed found in a tomb of Tuscania and now in the Vatican is exceptional, both in its technique (modeled *alla stecca* rather than mold-made) and its typology, for which there are no parallels in the area—or elsewhere, for that matter.³²³⁵

Fig. 64.1: Terracotta sarcophagus from Tuscania, detail. Tarquinia, Museo Archeologico 64 Handicraft, 250–89 BCE

2Northern Etruria

In the northern centers, which maintain a higher degree of internal autonomy and more lively social dynamics, the situation looks quite different. Traditional strengths continue to be cultivated at the same time as new typologies arise. The production of bronze votives, for example, testifies to the ongoing importance of metalworking, for which centers like Arretium had been famous long before the mid-Hellenistic period. Besides several smaller figurines, sanctuaries witness the dedication of medium-sized pieces, such as the child statue from Montecchio, near Cortona, now in Leiden (the “Putto Corazzi”), or the one from a sanctuary on the northern shore of the Lake Trasimene, and now in the Vatican (the “Putto Graziani”: [Fig. 18.9](#)).³²³⁶ Moreover, the life-size statue of Avle Meteli, the “Arringatore” ([Fig. 64.2](#)),

suggests that the workshop traditions that had produced the Chimaera and the Minerva of Arezzo in the late Classical and early Hellenistic periods did not experience major breaks during the following century. The mention of the local community as dedicator in its inscription underscores the role of civic patronage for the flourishing of these traditions.³²³⁷ (Nor should one overlook categories of metal objects belonging to different contexts, such as the bronze-sheet flasks that are typical of Clusium).³²³⁸ The contrast with southern Etruria is all the more apparent, as it cannot be simply explained in terms of technical specificities. The production of bronze artifacts notoriously shares several basic steps with the terracotta one. Furthermore, terracotta votives such as heads were produced in northern Etruria as well; as the examples of the votive deposit from the Via della Società Operaia in Arretium show, they do not copy old prototypes but are in line with contemporary stylistic trends—the same ones that can be detected in local architectural coroplastics.³²³⁹

The funerary sphere in northern Etruria, which contrasts most strikingly with the situation in the south, provides the best instance of the rise of new typologies of artifacts. It is particularly the cinerary urns of Clusium, Volaterrae, and Perugia that attest to the vitality of Etruscan handicraft in the third and second centuries in the eyes of modern scholars (Fig. 64.3).³²⁴⁰ The monuments produced in each of these centers are characterized by their own peculiar features as regards material, typology and style, as well as iconography and thematic choices. These features make them immediately identifiable and attributable to one of the three centers, even when the archaeological provenance is unknown. Alongside these specifically local traits, however, there also are overarching features connecting the monuments from all three cities, both with each other and with centers elsewhere in Italy and the Mediterranean. The affinities among urns are such that not only is it evident that artisans were well aware of what their colleagues in the neighboring cities were doing, but in some cases it is possible to argue for the existence of traveling sculptors and even surmise the establishment of local workshops in the wake of their travels. These relationships between workshops operating in the main centers differ from the ones attested in the south, where, as said above, the connections seldom go beyond the boundaries of one city's territory.³²⁴¹ Stylistically, the urns conform to the generally attested trends of Hellenistic art. Scholars have especially pointed to the pathos and dynamism that is usually associated with Pergamon and have even postulated a role for artists coming from the Greek East in the renovation of the formal language of the Volterranean urns in the first decades of the second century. Further relationships can be traced between Tarentine limestone sculpture and the urns of the second half of the third century from Clusium.³²⁴²

Fig. 64.2: Bronze statue of Avle Meteli ("Arringatore"), detail. Florence, National Archaeological Museum 64 Handicraft, 250–89 BCE

Quite significantly, the production of the urns implies a constant and active dialogue with other craftsman traditions, especially with coroplastics. The best example is provided by the relationship between the scenes of the Seven against Thebes as represented on the pediment of the temple of Talamone (Fig. 64.4) and on a series of urns from Volaterrae, Perugia, and Clusium (Fig. 64.5). Without copying each other directly, they clearly belong to the same iconographic tradition and come up with original adaptations of the same basic scene using similar principles.³²⁴³ Further examples of parallels between the imagery of the urns and architectural decoration lead us even farther south, for example to Campania. The goddess accompanied by a dog on a

terracotta frieze from Pompeii is remarkably similar to figures attested on the urns.³²⁴⁴ In other words, even though tightly connected to the northern Etruscan centers where they are located, the workshops producing urns are not at all isolated but participate in the life of broader artistic milieus.

Fig. 64.3: Alabaster cinerary urn from Volterra. Volterra, Museo Guarnacci

Figs. 64.4a–b: Pediment of the temple of Talamone, picture and diagram. Orbetello, Museo Civico 64 Handicraft, 250–89 BCE

A further characteristic of the urn production is its relatively high artistic and cultural level. In several instances, the stylistic features are so distinctive that they have led scholars to identify workshops and even individual masters.³²⁴⁵ Not coincidentally, some of the urns include self-representations of the artisans.³²⁴⁶ Usually, however, the chests of the urns are decorated with figural scenes that are either mythological or have strong eschatological undertones; decorative and symbolic motifs are also widespread. The choice of mythological themes, which is related to the need to express societal values and emotions that are relevant in the funerary context, is remarkably rich. Even though the iconography of each mythological episode is relatively constant, no single version of a given scene is perfectly identical to any other one. The artisans evidently did not feel bound to copying a template exactly,

but experimented and innovated with a certain degree of freedom. In some cases, an innovation might become permanent and give rise to a new branch of the tradition. The variants thus created are primarily visual, but they can have narrative implications—which suggests a high degree of familiarity with Greek mythology by the artisans.³²⁴⁷ As in previous centuries in Etruria, this familiarity does not come with reverential respect towards allegedly canonical versions of the myth and can produce peculiar results.

Fig. 64.5: Alabaster cinerary urn from Chiusi with scene of the Seven against Thebes. Chiusi, National Archaeological Museum

This does not mean that the urns should be understood only in terms of innovation and variety. The degree of standardization and uniformity can be quite high, especially when it comes to images that are devoid of mythological content, such as the travel or farewell scenes on Volterranean urns, which repeat the same imagery with very little variation and are not by chance more often attested on the less expensive tufa exemplars.³²⁴⁸ The most striking case in this respect is that of Clusium. After the third-century boom of the—mostly mythological—alabaster urns, the bulk of the production in the second century is represented by quite plain travertine urns, decorated with a restricted number of simple motifs, and by mold-made painted terracotta urns (Fig. 64.6). Unsurprisingly, the latter are typically used by members of the

lower strata of society, including freed slaves, whereas the travertine urns are made for—among others—the descendants of the great families of the previous century, for whom the funerary sphere has likely ceased to be a locus of self-representation and display of status.³²⁴⁹

Fig. 64.6: Terracotta cinerary urn from Chiusi. Cortona, Museo dell'Accademia Etrusca 64 Handicraft, 250–89 BCE

Notwithstanding developments like this last one, the urns clearly testify to the social vitality of northern Etruscan centers and to the consequences this situation had for handicraft—not only directly but also indirectly through the representations of the deceased on the lids. The figures are shown reclining at a banquet, usually holding richly decorated vessels such as *paterae* and drinking-horns, as well as mirror cases or fans in the case of women (Fig. 64.7). Moreover, the female recumbents in particular are themselves lavishly adorned with jewelry, including earrings, necklaces, armbands, rings, and crossing chains. Even though these mostly standardized images should not necessarily be taken at face value, they betray a desire for the ostentatious display of wealth in the private sphere that was undoubtedly real and that must have acted as a powerful driving factor for the patronage of luxury arts. Given that not much jewelry and precious metalware dating to this period has

survived, we can use the urn lids as indicators—if not of the actual appearance of the objects—of the degree of investment and attention devoted to the private sphere, the same kind of investment and attention that is attested in coeval Vetulonia by the terracotta friezes of mythological content used to decorate domestic spaces.³²⁵⁰

Arnaldo Marcone

65Society, 250–89 BCE

Abstract: It may be safely assumed that within the various Etruscan cities there was strife between the well-to-do aristocratic classes and the lower classes who constituted the majority of the population. The so-called “Prophecy of Vegoia” documents, for the beginning of the first century BCE, a conflict between owners and servants, a category probably encompassing all those who found themselves in a subordinate position.

In general, the agrarian structures of Etruria, especially in the north, were noticeably stable over an extended period of time, a stability that Rome was anxious to preserve, up to the outbreak of the Social War (91–89 BCE). If great properties belonging to the nobility were the fundamental component of the agrarian economy, the legal conditions of the laborers who worked them remain uncertain. The presence of slaves—or at any rate indentured workers—is certain; less clear is the situation of the classes of small dependent workers that are beginning to be identified through archaeological investigation.

And while it appears excessive to speak of Etruscan society of the beginning of the first century BCE as an “open society,” there does seem to have been a trend towards the mitigation of social conflict through a process of economic development and in consequence a reasonably acceptable political equilibrium within the community of citizens.

Keywords: Society, Romanization, Great properties, Social conflict

Introduction

It is widely assumed that Etruscan society enjoyed an internal social stability that was maintained, at least in part, with the support of Rome, even in the first century BCE—quite aside from the development of Romanization (see [chapter 37](#) Marcone).

There is no doubt, however, that the difficult conditions imposed by Rome on the cities of southern Etruria at the beginning of the third century—Caere, Tarquinia, Vulci, and subsequently Volsinii—must have had a considerable impact on the entire area. Rome’s territorial confiscations in these areas must have had a considerable effect on the economic development of the region, and therefore on social relationships, while the process took longer in northern Etruria.

1Aristocratic versus lower classes

The assumption remains valid, at least as a starting-point, that the internal life

of the various cities was characterized by stark contrasts between the prosperous aristocratic classes and the lower classes that constituted the majority of the population. Both Livy and Dionysius of Halicarnassus refer explicitly to limited groups of people (*principes*) who held power. The identification has found favor in the literature, among the Etruscan lower classes, of a specific intermediate class between freedom and legally sanctioned servitude, with access to forms of property, the *penestai*. Thanks to Helmut Rix's fundamental discoveries in the field of onomastics, nearly all the assumed vocabulary of servitude has been completely revised.³²⁵¹ In particular it has been shown that there is no proof of the existence of the *penestai* in Etruria. According to one view—much favored in the aftermath of the Second World War—that involved a thoroughly negative assessment of the effects of the Roman conquest on Etruscan society, and that is no longer accepted, these *penestai* formed the overwhelming majority of Etruscan society, a sort of equivalent of the Roman plebeians before the struggle for political emancipation.³²⁵² It has also been shown that the word, which actually appears just once in Dionysius in relation to Etruria, does not in fact refer to a specific legal condition.³²⁵³ It designates a type of bond between lower and ruling classes that characterizes various societies and is not typical of Etruscan society alone. In the specific case, Dionysius might simply have been making a comparison between the armies put in the field by Etruscan nobles with the Roman regiments formed by free citizens.³²⁵⁴

The fact remains that strong social tensions capable of shaking the very foundations of cities' social life are recurrent phenomena in Etruscan history. At the end of the fourth century, in 302, uprisings in Arretium (Arezzo) proved to be the underlying cause provoking a sort of general rebellion involving all of Etruria. From what can be deduced from Livy's succinct version, it seems that at the origin of the insurrection lay a conflict between the powerful local family, the Cilnii, which gravitated towards Rome and the plebs.³²⁵⁵

The revolt that involved Volsinii in 265–264 is known to us from several historiographic versions. To them should be added what is transmitted to us in a pseudo-Aristotelian work, *De mirabilibus auscultationibus*. In this text, which reflects the taste for ethnography and for utopia that was widespread at the Ptolemaic court in Egypt,³²⁵⁶ reference is made to a city in Etruria called Oinarea ("city of wine"), which was isolated on a hilltop surrounded by forests. Here, within a primarily oligarchic government, in order to prevent one of theirs from lording it over all, the masters entrust the government of the city to their own freed slaves who received, like Roman magistrates, one-year appointments. Rome put an end to this by intervening in support of the oligarchs, harshly suppressing the revolt that was destroying the city, and deporting the survivors.

It seems possible that this version, obviously the product of literary embellishment, was based on information acquired at the court of Alexandria

on the occasion of a Roman embassy that took place in 273, in which one Ogulnius participated, who was of Clusian-Volsinian origin. The historiographic tradition fundamentally agrees. The most complete version is transmitted by the Byzantine historian Zonara. According to him, Volsinii originally enjoyed a stable political system. What induced its inhabitants to dissoluteness would have been the Roman conquest.

2Social development

It remains in doubt whether—or how far—such social strife can also be interpreted as struggles between *gentes* of greater and lesser power within the gentile system, similar in some ways to the struggle between patricians and plebeians in republican Rome, or whether the struggles should be understood as the activity of a revolutionary type of servile elements unrelated to the *gentes*.

A passage in Diodorus Siculus (5.40.3) that derives from Posidonius seems to refer to the peculiarity of the social situation of the Etruscan cities.³²⁵⁷ Diodorus also takes up the matter of the exceptionally luxurious lifestyle of the Etruscans. One of the more evident manifestations of such *tryphé* was the banquets organized with the assistance of many slaves—some of them dressed in a fashion not appropriate to their status. The banquet would thus become a reflection of disturbed social relations apparently due to a level of wealth so elevated as to afford servants a standard of living close to that of their employers.

This multiplicity of references to the peculiarity of Etruscan social development requires consideration. It is out of the question that these servants resided outside the law and thus easily assimilated to slaves. On the contrary, it is safe to assume a phenomenon of moral degeneration that, to adopt the perspective of the ancient sources, could be attributed to excessive “luxure”—in other words, forms of rapid, undisciplined acquisitiveness that underlay unforeseeable social destabilization. It is plausible that a strongly hierarchical society, which grew more and more rigid within, could have experienced a sort of proxy, a virtual transfer of the management of power from the heads of the few most powerful families to their own slaves. And it is also entirely comprehensible that such an outcome of social development would have provoked a sensation. This explains the reflections of contemporaries on the case with such peculiar developments within the utopian and ethnographic literature as well.

The ultimate outcome of such a process of social and political confusion, which probably began painlessly, would either have been the effective undermining of internal order, or that the slaves—profiting from their position—would definitively overthrow their masters from positions of power. Given

the situation, Roman intervention to reestablish order was inevitable. The exemplary nature of the punishments inflicted by Rome may be seen as a response to the specific risks, in terms of interstate relations, from a situation of internal instability that could have the effect of dragging in other Etruscan cities as well.

The so-called “prophecy” of Vegoia also seems to refer to a somewhat similar situation. The prophecy is a sort of “cry of pain” from the slaves, who on their own initiative removed the *termini* and, to make matters worse, did so with the connivance of degenerate owners.³²⁵⁸ In short, it follows that the farms were accessible not only to the lawful landowners but also their slaves, who would have profited from the situation by moving property boundaries, and thus provoked a situation that seriously disturbed the social fabric.

The question remains open of the actual existence in Etruscan society of the *lautni*, a possible equivalent to the Roman freedman. In reality such caution is indispensable, because while it is true that the *lautni* appear in some 200 epigraphic texts in a subordinate position, and two bilingual inscriptions render *lautni* with *libertus* (freedman),³²⁵⁹ these are no clear proofs that such a position derives from a procedure, a legal action (emancipation), like that known for Rome.³²⁶⁰ As for onomastic formulas, a variety of which were used in Rome, they do not in themselves clarify the relationship between the *lautni* and their masters. Even less clear is the position of the *lautni* with respect to the right of citizenship.³²⁶¹ It is true that the internal dynamics of Etruscan society, in particular those coupled with the progress of Romanization, make it possible to assume the existence of a figure similar—albeit not entirely identical—to the Roman freedman, whatever he may have been called. Also, the distribution of the inscriptions that mention *lautni*, which are relatively numerous in the territories of Clusium (Chiusi), Perugia (Perugia) and northern Etruria, but absent in Tarquinia, Vulci, Volsinii, and other places, remains to be explained.

In any case the epigraphic monuments present us with numerous families—for the later period we know almost their complete genealogies—in every one of the Etruscan cities in apparent social equality. But it is also possible to catch a glimpse of the formation of broader familial associations, distinct from an individual *gens*, of which numerous branches can be traced outside the sphere of the city of origin. In the strict, Roman, sense of the word *gens*, it has frequently been shown that *cognomina* are added to the gentile names in order to distinguish the various branches of the family. The small, strictly family tombs of the Archaic period are replaced by grandiose gentile hypogea with many burials. Marriage seems to occur more frequently between members of certain *gentes*, who then prove to be the same ones who most frequently take up political and priestly positions. This can be explained quite reasonably with reference to the gentile social system and *implies* a later date and a greater importance of some *gentes*. With respect to this situation, the cities of northern Etruria, which were less involved in Roman territorial

reorganization, seem characterized by a more evident stability and a more gradual development.

3The consequences of the Second Punic War

In the course of the Second Punic War (218–202 BCE), the support of the Etruscan cities in Rome's confrontations was loyal and considerable. Despite this, the war left the Etruscan cities in great internal difficulty. The risks of general upheaval were high. In 196, the praetor Acilius Glabrio suppressed a slave revolt that had seriously threatened Etruria. Rome's assistance was indispensable in preserving the ruling position of the oligarchic governments that ran the Etruscan cities. A good example is the suppression of the cult of the Bacchanales that diffused rapidly from Etruria—where it was born—throughout Italy, beginning in 186. The claim that this conspiracy had the character of a social rebellion is very doubtful; it involved nocturnal rituals to which were attributed forms of sexual depravity and even ritual murder. The success it enjoyed, with very broad popular participation beyond the control of civil authority, implies nonetheless some form of social frustration.

In the decades following the Second Punic War, the agrarian question does not seem to have constituted a central political topic in Italy. The serious decline in population that was brought about by Hannibal's war must have favored the expansion of the property held by the richest classes without bringing about, at least immediately, deterioration of the condition of the farm population. Furthermore, the increased availability of public land gave every citizen in a powerful position unprecedented access to ample portions of land. But above all, social tension would have to be averted by the great influx of wealth flowing in from overseas conquests.

It is thus plausible to suppose that the Etruscan area too could have benefitted, in whole or in part, from this favorable situation that preserved it for several decades from the increasing harshness of Roman demands. The oligarchies of the cities of northern Etruria probably agreed to some form of integration of the lower classes, with the purpose of satisfying their demands and thus preventing the exacerbation of social tensions. It is true that slavery as such did not disappear, although it was, above all, a phenomenon characteristic of southern Tyrrhenian Etruria.

The agrarian structures of Etruria, especially in the north, long maintained features of substantial stability that Rome was anxious to preserve even at the outbreak of the Social War (91–89 BCE). While the fundamental component of the agrarian economy consisted of the great properties belonging to nobles, the legal condition of the workers who cultivated them remains uncertain. The presence of slaves or in any case bondsmen is certain. Less clear is the situation of the classes of small dependent workers that have come to be

identified through archaeological investigation. The population of central-northern Etruria was highly differentiated, as can be verified in the territories of Volterra, Clusium, and Perugia. In the period after the Second Punic War, the territory of Clusium is distinguished by the presence of small rock-cut chamber and corridor tombs with burial niches in the walls. Furthermore, it turns out to be densely populated with secondary settlements with big farms. We may suggest that here we find a production unit of family or servile management that can be attributed to sparse settlement. With respect to a relatively limited group of aristocrats, the existence of classes of small or medium-sized owners thus appears admissible.

4The society of Clusium

From the point of view of research into the social composition of the population, the Etruscan case is distinguished by the possibility of reconstructing it on the basis of the organization of funerary space. It turns out that the number of people who could have a burial was particularly high especially for the later period (third–first centuries BCE). About 2,700 epitaphs have come down to us that mention at least 600 different gentilicia, which allows us some degree of knowledge of a large and distinct percentage of the population.³²⁶² Even though we cannot assume full comprehension, we can at any rate believe that we have archaeological documentation relating to about 40percent of the entire civic body, which is quite significant.³²⁶³ We may add that, alongside standardized humble burials, lavish funerary monuments have also been preserved, so adequate representation of different social classes is available.

Especially between the mid-third and mid- second centuries, a noteworthy presence of metal objects is recognizable in the funerary equipment, an indication of overall wealth. The prevailing ritual of cremation must also be seen in relation with an elite of considerable economic means.

The variety of the tombs declines with the passage of time; the funerary monuments tend toward homogeneity. This tendency leads to various conclusions. It is possible that Clusium felt the effect of diffusion of Roman values or perhaps of sumptuary legislation that imposed more sober customs.

It may be going too far to hypothesize, on this basis, political transformations involving the abandonment of preceding oligarchic regimes. Nonetheless, one can hardly avoid recognizing the reality of economic decline which brought in its train inequality of some, if not of major, significance.

The aforementioned Prophecy of Vegoia documents, for the beginning of the first century BCE, the contrast between owners and servants, among whom are probably to be counted all who were in a subordinate position. In view of some inner northern Etrurian cities' typical practice of delimiting

private gentile property with boundary markers just as for public property, in this period, a sort of agrarian regime can be assumed that economically equalizes the largely literate rural population. This resulted from the strong social tensions that were likely present at the beginning of the second century.³²⁶⁴

On the other hand, smallholdings remained important in Italian agriculture, even if they lost some ground following the Second Punic War and the prolongation of military service in the overseas campaigns that depleted the manpower available for work in the fields. Traditional agrarian management remained preponderant in vast areas of central Italy and the Po Valley, and did not completely disappear even in the districts where the land concentration was greater, as in southern Etruria.

As for urban craft production, it seems that the workshops were divided between the freeborn and slaves. In this sector too, small productive enterprises directly controlled, or under slave management, are shown to have been fundamentally stable. Some high-quality products of the first half of the fourth century gradually gave way to forms of standardized and simplified production. The new features of such manufacture probably imply a different organization of work. The new relationship between craftsman and customer, the standardization of products, and the increasing technical and formal decline were the harbinger of more general economic, social, and political transformations of Etruria, more evident in the southern region of older artistic traditions.

5Political integration

The German linguist Helmut Rix assumes, on the basis of epigraphic evidence, that between 280 and 140, “social revolutions” in northern Etruria led to the political integration of the dependent classes.³²⁶⁵ Rather, the change in the onomastic formula that took place may have been the effect of pressure from Rome in relation to the census and military service.³²⁶⁶ Regarding military service, its important role in the development of society in the various Etruscan cities can be recognized. It has been estimated³²⁶⁷ that if 15 percent of the Etruscans were employed as soldiers in the Roman army, which would have involved about 10,500 men.

The reasons for Etruscan opposition to M. Livius Drusus the Younger’s proposal to grant full Roman citizenship to the Italici have been explained in various ways. It has been attributed both to the conservative orientation of the Etruscan nobility with respect to changing relations within the cities that had already distorted the overall balance, and to the fact that Etruscans and Umbrians would have been less interested than other allied communities in exchanging land for citizenship. Exactly this sort of exchange has to be

considered the herald of unacceptable changes in social relations. In any case it is reasonable to suppose that Etruscan society would have maintained some fundamental elements of continuity. Nor, on the other hand, is it out of the question to speak of a general philo-Marianism for Etruria. For Clusium, there is no obvious proof of its prominent involvement in the struggle between Marius and Sulla.

What is certain is that in 91 BCE, Etruscans and Umbrians came to Rome to protest the provisions of Livius Drusus. It is believed that the agrarian reforms of Drusus damaged the system of small and medium landholdings. It is also supposed³²⁶⁸ that the opposition of Etruscans and Umbrians concerned the grant of Roman citizenship rather than the agrarian laws, because the grant of citizenship would have the effect of aiding the lower classes, which were traditionally excluded from political power. The explanation of this hostility of the Etruscan ruling classes to the granting of citizenship, however, does not require invoking a supposed “feudal” structure for Etruria at the beginning of the first century BCE that was dominated by latifundia worked by a peasantry enslaved as serfs. Instead, we must recognize the signs of a changing society that had responded, albeit on their own time and with their own methods, to the contact with and influence of Rome, and to the development of economic relations. Nevertheless, to speak of early first century Etruscan society as an “open society” in which the nobility made “a show of enlightened openness toward the lower classes” is to go too far.³²⁶⁹ This represents a tendency toward mitigating social conflict by way of an economic development that privileged a political equilibrium that was more acceptable within the community of citizens.

Local peculiarities are obviously important, particularly in northern Etruria. The villas here are scattered and are found only along the coast. At Volterra, the Cecina family negotiated their own allegiance to the Roman state both to protect their interests and to guarantee continuity of agrarian management, social order, and the prevailing ideological system. In contrast to Volterra, at Luni Romanization does not seem to have produced significant consequences. As for Pisa, the growing significance of the port favored social change as the result of the involvement of new families in manufacture and commerce. At the same time new groups such as the freedmen emerged that were less bound to social norms.³²⁷⁰

6Caught between Marius and Sulla

The philo-Marian choice of many Etruscan cities might have various explanations, and it seems plausible that precisely the internal dynamic of at least part of the Etruscan world could have played an important role. The case of Clusium is particularly significant because of the profusion of epigraphic

evidence and the abundance of funerary finds. The social groups known to us reveal a close relation between the groups themselves and the aristocratic citizen classes, rather than an opening up of the aristocracy. We may imagine a general improvement of the middle and lower classes with an associated erosion of the preeminent position of the aristocracy.

We know from Plutarch that in 87, Marius, who was coming from Africa with limited forces, landed at Talamone and succeeded in recruiting sizable forces from among the Etruscans. It is likely that Talamone had been deliberately chosen as a place to land, especially in light of the fact that he succeeded in winning over to his cause 5,000 or 6,000 “Etruscans.” If we are to see in these “Etruscans” representatives of the traditionally enslaved classes (slaves and similar categories), who had been attracted by the opportunity for gain afforded by military service, a very different picture of Etruscan society emerges. In it, still-traditional elements of the “ancien régime,” at least in the regions of the most intensive agricultural exploitation, coexist with more developed forms of social relations. As for the thousands of men who accompanied Marius from Africa, we can imagine that, alongside Moorish knights, some were Etruscans. Plutarch (*Mar.* 41.2) speaks generically of persons “who came from Italy.” An African colony of Etruscans has been revealed at Wadi Milian in the hinterland of Tunis by some inscriptions with definitions of the boundaries laid down by one M. Unata (a name that suggests a Clusian origin). The Etruscans in question called themselves *dardani* (Fig. 38.6). If they really belonged to the group of colonists who settled in Africa in 103–100,³²⁷¹ Marius’s decision to land at Talamone presupposes complex relations from the point of view of social history as well. Yet this may have been merely antiquarian nostalgia on the part of a group of veterans settled around Thuburbo Maius, an area of Augustan allocations, who proudly called themselves *dardani*.³²⁷²

In 82, northern Etruria finally became involved in the military operations of Cn. Papirius Carbo, in the Cisalpine region. In this case the Etruscan cities that definitely lined up against Sulla were Arretium (Arezzo), Fiesole, and Volterra, which endured a severe siege that lasted three years, a stiff penalty for its opposition to the dictator. Again in the following years, it was Fiesole that was at the heart of unresolved episodes of conflict. In 78 the Fiesolans were distinguished by the support they provided to the attempted revolution of Lepidus, who barricaded himself into the northern part of the region. Fiesole, on the other hand, was the only city in Etruria in which Sulla’s allocations had been brought to completion with all the consequences that that sort of procedure entails.

The decisive turn in Etruscan society would take place toward the end of the century under the agency of Augustus, who promoted a grandiose program of urban development, in particular in the southern part of the region, which attracted a large number of immigrants and nouveaux riches, a development that remained visible until the end of the Empire.³²⁷³ There are several

senators for whom an Etruscan origin can be ascertained.³²⁷⁴ It was the moment of permanent integration.

66Ritual and Cults, 250–89 BCE

Abstract: The period from 250 to 89 BCE was marked by the completion of the Roman conquest of Etruria. The Etruscan territory was eroded by the establishment of colonies on Etruscan territory and by the construction of consular roads. Faced with these changes, the aristocracy sought refuge in the search for salvation in doctrines and mysteries of Greek origin, indeed in an apocalyptic prophetism, but rituals and cults changed essentially by being widely and progressively assimilated to those of the Roman conquerors. These religious doctrines had long been successful in Etruria. For example, a whole tradition made Etruria one of the centers of Dionysianism. For Clement of Alexandria, the *cista mystica* containing the phallus of Dionysus, who had been killed by the Titans, was believed to have been brought to Etruria. The cult of Dionysus-Bacchus, with its occult and initiation aspects, is thought to have been introduced to Etruria by a “Greek of obscure origin” (*Graecus ignobilis*). Fourth-century funerary iconography (in particular, the Tomb of the Orcus II in the necropolis of Monterozzi) already showed signs of influence by Greek, Italic, and especially Siceliot doctrines, of an Orphic-Pythagorean type, but the number of occurrences significantly increased in the third century. Until 186, there was a vogue for Dionysian associations. Several sarcophagi show that the deceased were members of groups worshipping *Pacha*, Bacchus in Etruscan. In Chiusi, some deceased are represented on urns or sarcophagus lids with a *kantharos*, an *oinochoe*, or a *patera* in their hand and sometimes with a garland around their neck.

Keywords: Romanization, Dionysianism, Orphism, oracles

Introduction

The period from 250 to 89 BCE was marked by the completion of the Roman conquest of Etruria. The Etruscan territory was eroded by the establishment of colonies on Etruscan territory and by the construction of consular roads. Faced with these changes, the aristocracy sought refuge in the search for salvation in doctrines and mysteries of Greek origin, indeed in an apocalyptic prophetism, but rituals and cults changed in a big way, by being widely and progressively assimilated to those of the Roman conquerors.

1Success of salvation doctrines

The period saw the multiplication of religious associations linked with Greek cults related to salvation doctrines. These religious doctrines had long been successful in Etruria. For example, a whole tradition made Etruria one of the

centers of Dionysianism. For Clement of Alexandria (*Protr.* 2.19.1), the *cista mystica* containing the phallus of Dionysus, who had been killed by the Titans, is believed to have been brought to Etruria. The cult of Dionysus-Bacchus with, its occult and initiation aspects, is thought to have been introduced to Etruria by a “Greek of obscure origin” (*Graecus ignobilis*: Livy 39.8.3–4; Clem. Al. *Protr.* 2.23–21). Fourth-century funerary iconography (in particular, the Tomb of the Orcus II in the necropolis of Monterozzi) already showed signs of influence by Greek, Italic, and especially Siceliot doctrines, of an Orphic-Pythagorean type, but the number of occurrences significantly increased in the third century. Until 186, we observe a vogue for Dionysian associations.³²⁷⁵ Several sarcophagi show that the deceased were members of groups worshipping *Pacha*, Bacchus in Etruscan.³²⁷⁶ In Chiusi, some deceased are represented on urns or on sarcophagus lids with a *kantharos*, an *oinochoe* or a *patera* in the hand, and sometimes with a garland round their neck.³²⁷⁷

The Dionysian cult supposedly spread from Etruria to Rome and, because it was said to have degenerated into nighttime orgies and criminal acts, was apparently banned by a decree issued by the Roman Senate in 186, which launched a violent crackdown all across Italy, as shown by a copy of the *senatusconsultum* sent to *Ager Teuranus*.³²⁷⁸ It is thought that is the reason that in Bolsena, an underground chamber dating to 200 BCE, which could have housed a small sanctuary of Dionysius/Pacha, was destroyed.³²⁷⁹ In the destruction pits of this building, terra-cotta fragments of a Dionysian throne were unearthed. This piece of furniture is richly adorned and surrounded with *putti* riding panthers and playing with garlands. Dating from around 250, an Etruscan inscription was found at Tarquinia (*ET Ta* 1.17). It is engraved on a relief that shows a stone *volumen* held by a deceased author of Haruspicine books reclining on a sarcophagus. His name is Laris Pulenas, priest of Bacchus and Catha; his eponymous ancestor was called Pule—that is, Polles, the name of a Greek seer.³²⁸⁰ In Etruria, as throughout the Italian peninsula, the name Dionysus is associated with a long string of social revolts, and it takes on a mystical dimension and a “national” connotation.

The Orphic-Pythagorean conceptions of Greece and Southern Italy were also adopted by many Etruscan aristocrats. The head of Orpheus prophesying appears on third-century mirrors and gems, and local adaptations of the Orpheus myth are frequent in iconography. It appears either as an anonymous head prophesying, or as a character named Umaele represented in an Apollonian context, or a character transcribing the words of a prophet.³²⁸¹ The Orphic tradition seems to explain the spread of the *caput Oli Volcentani* legend that was linked with the foundation of the Capitoline cult.³²⁸² Male and female demons are shown accompanying the deceased in representations of voyages to the underworld or in eschatological scenes. In the “Four-Charon” Tomb in the necropolis of Monterozzi, each of the demons is distinguished by an epithet and by attributes (skin color, garment, facial

appearance, etc.). They correspond to a classification of the gates for safely entering the underworld. The Tomba del Cardinale (Tomb of the Cardinal) in the necropolis of Monterozzi places scenes of voyages to the beyond side by side on the tomb walls like the pages of a book. The motif of the deceased's journey in a carriage drawn by demons showed that the soul of the deceased was capable of making its way on the sacred way (*hiera odos*) of Orpheus initiates. On the sarcophagus case of Laris Puleas, the cult of Orpheus is recognizable from the fact that a magistrate (perhaps the deceased), avoiding punishment, goes through a gate leading to the Just and the heroes.³²⁸³ The link between Pythagoreanism and Etruria is so strong that literary accounts mention the presence of Etruscan disciples by the side of Pythagoras,³²⁸⁴ and several authors describe the philosopher as "Tyrrhenian."³²⁸⁵

The Phoenician and Syrian god Adonis, worshipped in Greece, was also worshipped in Etruria. A second-century Tuscania urn, adorned all around with holes perhaps intended for flowers, depicts a dying Adonis.³²⁸⁶ Edifice δ of the sanctuary of Gravisca has a Latin inscription of the Augustan period with the name of the young Adonis.³²⁸⁷ It was deduced from this, despite the apophthegm *ouden hieron* (Phot. *Lexicon* o 615; *Suda* o 798 Adler), that a sanctuary devoted to Adonis existed, with facilities meant for the festivals of the Adonia. Mario Torelli recognized in the edifice courtyard accommodations for the different stages of the festival. In the North portico, there was a ritual of climbing onto the roof to wait for the god's to arrive; the chamber beside the northeast corner of the portico was the location of the wedding between Adonis and the protagonist of the festival playing the role of Aphrodite; the stone plate facing east-west was the tomb of Adonis; and in the unpaved part of the square was a garden where the god's short-lived lettuce was planted.³²⁸⁸

The Eleusinian doctrine was also successful in Etruria: the sanctuary of Campetti in Veii presents analogies with a *thesmophorion*. As in Bitalemi near Gela in Sicily, buried *hydriai* were found as well as a bronze statuette carrying a piglet. In Fontanile di Legnisina on the outskirts of Vulci, two of the 234 terra-cotta uterus discovered are dedicated to *Vei*,³²⁸⁹ an Etruscan goddess who might have fulfilled the same educative and agrarian functions as Demeter.³²⁹⁰

The influence of foreign doctrines can be observed on the bronze liver model from Piacenza, dating to the late second or early first century BCE. Some deities whose names appear in the regions of the liver (Thusc, Mae, Tnvth, Letham) are not attested elsewhere; they are esoteric elements probably known to a social or religious elite and did not necessarily find an echo in the population.³²⁹¹ In the first century BCE, representatives of old Etruscan families like Nigidius Figulus or Fonteius Capito spread elements of these Orphic-Pythagorean doctrines among the Roman elite.

2Prophecies and oracles

The success of ideas and ritual practices of the Greek world may explain the revival of oracular cults during this period. Scenes of oracle consultation and oracles' replies are represented on monuments of the late Hellenistic period.³²⁹² Late third-century mirrors and urns show a character named Cacū prophesying to the sound of a lyre with his words being transcribed on a diptych by a really young man called Artile.³²⁹³ The scene refers to events supposed to have occurred at the time of Servius Tullius, since Cacū is flanked by two warriors whose names are given by a slightly older mirror, Caile and Avle Vipinas. A link is established between this surname of Vipinas and that of Servius Tullius in the fragments of a speech by emperor Claudius in the senate in 48CE transcribed on the Lyon tablet.³²⁹⁴ All these objects may allude to the oracular character of the major Etruscan sanctuaries, where strange phenomena like the presence of blood in the river water of Caere (*Caeritis amnis*) and in the spring of Hercules in 217 (Livy 22.1.10) were discussed.

Scraps of this type of prophecy that spread throughout Etruria are known through the treaty of *agrimensores* in which the nymph Vegoia informed Arruns Velthumnus³²⁹⁵ of great upheavals in Etruscan society and described apocalyptically the misfortunes that were to befall Etruria, the land and inhabitants because it gave way to greed and an unquenchable thirst for land. "Then also the earth will be moved by storms and whirlwinds with frequent destruction, crops often will be injured and will be knocked down by rain and hail, they will perish in the summer heat, they will be felled by mildew. There will be much dissension among people."³²⁹⁶

This prophecy insists on the permanent character of boundaries and considers changing these boundaries an act of sacrilege. Meticulous analyses of the text make it possible to recognize more ancient cosmogonies and instructions that had undoubtedly been known for a long time, but the text was written in the first century BCE, as is known because it refers to the eighth *saeculum*, or era, of Etruscan history. It may even have been written at the time of the Social War. The bill of M. Livius Drusus of 91 BCE, which proposed to extend the right of Roman citizenship and to link its granting with agrarian reform, met with strong opposition from *principes*. The issue was indeed worrisome for the Etruscan elite. Volterra urns depict a scene of the murder of two magistrates performing their duties, perhaps Tiberius and Caius Gracchus, who died at precisely the time when they were trying to pass agrarian laws. Already in the first half of the third century, slaves of Volsinii are said to have seized power and landlords' possessions.³²⁹⁷ The sensation caused by the prophecy can be explained by the preservation of an ancient cult of boundaries. Deities like *Selvans* kept watch on the borders. *Selvans Tularia* (CIE 10870) is believed to have protected all the borders, and *Selvans Sanchuneta* (ET Vs 4.8) the boundaries of the sanctuary of Pozzarello near

Bolsena.

The feeling of a precise length of time granted the Etruscans that can be read in the prophecy of Vegoia is supported by the practice of a series of rituals meant to record the passage of time. The Romans used *clavus annalis*, a term that they claimed dated back to a very ancient period, for the custom of driving a nail into the side wall of the temple of Capitoline Jupiter on the Ides of September every year (Livy 8.3), in order to count time before the widespread use of writing (Festus, *Gloss. Lat.* s.v.); it was kept later for the sake of religious respect for old customs. The preservation of these practices is attested by magical nails of the third and second centuries, discovered in the Pozzarello sanctuary near Bolsena³²⁹⁸ and in the sanctuary of Sant'Antonio in Caere³²⁹⁹ that Giovanni Colonna associates with the cult of Rath/Apollo.³³⁰⁰ The antique dealer Cincius, who may have had Etruscan family ties, was an eyewitness in the late first century BCE to an essential ritual of this cult. According to him, as reported by Livy (7.3), "At Volsinii, too, nails may be seen in the temple of Nortia, an Etruscan goddess, driven in to indicate the number of years."³³⁰¹ The cult of a goddess called Nortia in the Roman Volsinii is confirmed in a late period (Juv. 10.74; *CIL* VI 537.4, *CIL* XI 7287). These ancient cults persisted and were influenced by foreign doctrines. We know from late sources that, conceivably as early as in the late Hellenistic period, an alliance between cosmological and millenarian theories, Etruscan conceptions of divine unknowability, and aspects of Hebraism and Mazdaism took place. Fragments of these combinations are visible in the Tyrrhenia entry of the *Suda* and in Lactantius Placidus (*Schol. ad Stat. Theb.* 5.515).

The success of contemporary philosophical currents, in particular stoicism, also explains the revival of cleromancy in the third and second centuries.³³⁰² Numerous lots bearing the names of deities in the genitive have been found in contexts of that time. Some are pebbles with embossed inscriptions, or lead discs with a hole; or small, long and rectangular bars that may be ex-votos rather than actual lots—that is, imitations of actual lots. A second-century stone from Arretium with a dedication to *Aplu Puteś* on one side and perhaps a ritual prescription on another side, as well as lots engraved with Latin texts—a late third-century lot from Veii (*Minerva dei(ve)*), and perhaps another from Chiusi (*lanis tune*)—obviously belong to the same category. Livy (21.65.5) writes that at Caere, the tablets for divination had been reduced in size, an event that Colonna places in the sanctuary of Sant'Antonio dedicated to Rath (=Apollo).³³⁰³ The second category, lead discs, is represented by a disc from Arretium with the name of the deity *śuri* in the genitive. The category of small rectangular bars includes two items: a lot from Viterbo from a sanctuary at La Cipollara engraved with the inscription *śuris savcnes*, dating from the third or second century; and a long lot, engraved with the name Artumes, discovered in the vicinity of the temple of Ara della Regina near Tarquinia, dating to the same time. Finally, the sort which the haruspex C. Fulvius Salvis offers a god on a relief discovered in Ostia may be considered a

depiction of lots.³³⁰⁴ A child would draw a lot from those collected in an urn, a box, or a vase, and hand it to a *sortilegus* priest, who was in charge of reading and interpreting it. Two late second-century urns show an urn, a krater or an amphora placed in a *naiskos* temple, beside which a middle-aged man in the vestments of a priest or a *haruspex* can be seen.³³⁰⁵

3Traditional cults and Romanization

Traditional cults suffered from the destruction of big Etruscan sanctuaries during wars of conquest by the Romans.

In the mid third century, after the capture of the town of Veii in 396, the famous statue of Apollo and other acroterial and votive statues from the sanctuary of Portonaccio in Veii, were buried behind the retaining wall of the embankment above the sanctuary terrace; and many ex-votos, dating from the fifth to the third centuries, were buried in a cistern facing the temple of Portonaccio. A triumph of Q. Marcius Philippus *de Etrusceis*, in fact probably over the Tarquinians, was celebrated in 281. Most edifices of the sanctuary of Gravisca were destroyed during that period. In 280, a triumph of Ti. Coruncanius *cos. de Vulsiensibus et Vulcentibus* was celebrated. In 264, the town of Volsinii was destroyed, its inhabitants were displaced to a new city, Volsinii Novi, and the sanctuary of Voltumna was plundered by the Romans (Plin. *HN* 34.34). The consul M. Fulvius Flaccus is said to have evoked (*evocare*, “called forth to Rome”) the great god of Volsinii Voltumna-Vortumnus, by building a temple for him in Rome. It is even known that M. Fulvius Flaccus who was awarded a triumph *de Vulsiensibus* in 264, was represented in triumphal clothes in the temple of Vortumna on the Aventine (Festus, *Gloss. Lat.* p. 288 s.v. *picta*). He is believed to have dedicated part of his plunder on a round base in the center of the sanctuary of Sant’Omobono at the foot of Capitoline Hill.³³⁰⁶ In 241, the city of Falerii was also destroyed and its inhabitants were displaced to a new city founded for this purpose, Falerii Novi. Minerva, the main goddess of Falerii, is said to have been “imprisoned” in the temple of *Minerva capta* on the Celio. In 273 (Cass. Dio fr. 33), half of the territory of Caere was seized and then colonies, such as Castrum Novum and Pyrgi, were formed all along the Tyrrhenian coast.

These destructions and confiscations brought about a decline in the number of people attending the great sanctuaries of the Archaic period. If the presence of black-glazed ceramic vases and of ex-voto is anything to go by, the sanctuary of Gravisca was reoccupied in the mid third century. Offerings were deposited near the altars and the (statue?) bases as well as in room M, and worshippers went to the Adonion until the Augustan period. Caeretan sanctuaries remained active until the third century, but the last Etruscan ex-votos of the temple of Manganello date from the late second century; the

Veian sanctuaries of Campetti and Macchiagrande experienced a certain loss of interest from the second century onward; and from the mid third century to the first century BCE, mostly black-glazed ceramics and Italic sigillated potteries were deposited in the sanctuary.³³⁰⁷ Etruscan worshippers in some places seem to have resisted the forms of religious Romanization represented by the wearing of veils and *bullae*. In Tarquinia, a city the Romans had difficulties conquering, only ten heads out of 223 were veiled.³³⁰⁸ In Caere, in Manganello,³³⁰⁹ and among the heads of the Museo Gregoriano Etrusco,³³¹⁰ the majority of covered heads are not veiled. In Gravisca, the votive head of woman is without veil³³¹¹ and the statuettes of babies in swaddling clothes do not have *bullae*.³³¹² In Fontanile di Legnissina, only one baby of five is adorned with a *bullae*.³³¹³ In Faliscan territory, veiled heads were few and far between, and babies in swaddling clothes had no *bullae*. Narce only delivered one veiled head out of three votive heads,³³¹⁴ and Falerii yielded two veiled heads out of seventeen between the end of the fourth century and the first century BCE—one in Celle, the other in Vignale, and no baby wore a *bullae*.³³¹⁵

In most cases, sanctuaries were simply rearranged or redecorated. In northern Etruria, on the Volterra Acropolis, two temples from the end of the third to the end of the first century BCE were built where there had been a *sacellum* of the early fifth century;³³¹⁶ in Vallebuona, on the Piazza della Pescheria, a temple of the end of the Archaic period was restored in the third and again in the second century;³³¹⁷ in Talamone, where the pediment of temple built on the top of the hill in 225, was redecorated in the first half of the second century with a scene representing the Seven against Thebes.³³¹⁸

It is safe to say that at the end of the second and the beginning of the first centuries BCE, the cults of great deities of the Etruscan pantheon lived on, especially outside of Etruria proper. Blocks with inscriptions of Feltre in Rhaetia (*ET Pa* 4.1) show that there was a cult of Tinia in a sacred edifice. In Tunisia, in Smindja, in an Etruscan-Latin settlement of a colonial type, some *cippi* (*ET Af* 8.1–8) delimit a territory under the protection of Tina and dedicated to the Dardanians (Fig. 38.6).

The continuing activity of sanctuaries is to be related to the influx of exchanges and populations thanks to the building of consular roads and the installation of settlers. Perhaps the continuing activity of Veian sanctuaries after the destruction of the city of Veii in 396 is to be explained by the proximity of the Rome-Nepi-Sutri road and by the building of the Via Cassia. In Macchiagrande, to the northeast of Veii, five third or second century altars have dedications in Latin to Roman gods (*Minerva, Victoria, Jupiter Libertas, Apollo, Dii* and *Deae*).³³¹⁹ In the sanctuary of Portonaccio, again from the third century, Latin colonists visited the altar of Minerva and its annexes, as evidenced by the famous dedication of L. Tolonius to Minerva,³³²⁰ at least until the early second century, when the porticos were destroyed, the cistern blocked, and the altar dismantled. Roman colonization caused a reorientation

of religious practices. The sanctuary of La Catona in Arretium, situated near one of the city's main streets, was newly decorated during the first half of the second century; the new decor took on themes praising Rome (friezes of Celtomachy and Trojan scenes) and celebrating the alliance between Rome and Arretium.

In the late Hellenistic period, official Etruscan cults were replaced by corresponding Roman cults, even in the cities of northern Etruria, but Etruscan particularities survived, like the oracular tradition that was preserved thanks to the aura that still surrounded the Etruscan language. In the countryside, where Romanization may have been slower, traditional cults apparently continued, particularly in gentile groups. A bronze statue, discovered near Perugia in 1566, commonly called *Arringatore* ("the haranguer") because the man represented is standing, his right arm outstretched, his hand raised and open as if making a speech, was perhaps wrongly interpreted too restrictively as the only evidence of a will to display Roman *gravitas* ostentatiously. The presence of a long Etruscan votive dedication engraved on the edge of the toga, dating from the late second century at the earliest,³³²¹ shows that the statue is also an offering of Aule Meteli, son of *Vel* and of *Vesi*, to the god *Tece*, probably dedicated in a sanctuary on the shore of Lake Trasimeno.

67Economy, 250–89 BCE

Abstract: This chapter explores the economic realities of Etruria from the third through the early first century BCE. These realities include increased contact with Rome as well as changes in demography and social structure. This period also furnishes the strongest evidence for the nature of land ownership, which is provided by boundary markers as well as two important inscriptions (the *Tabula Cortonensis* and the *cippus* of Perugia) that served to adjudicate land.

Keywords: economy, property, Romanization, *latifundia*

Introduction

The experience of Romanization in Etruria was not a monolithic process, and both archaeological and literary evidence document the changes that were occurring in different areas at different times. Significant social transformations were occurring in this general period, beginning with the rebellions at Arezzo in 302 BCE, and at Volsinii in 265–264, both of which targeted the ruling elite. This social discord involving the lower classes—well explored in [chapter 65](#) Marcone—has important economic implications as to labor and ownership during this period.

One aspect of the economic relationship between Rome and the various Etruscan cities can be inferred from the “allies’ shopping list” of goods requisitioned by the Roman state for its expedition to Africa during the Second Punic War in 205 (Livy 28.45.13–18). According to Livy, Populonia offered iron, Caere sent grain, Volterra sent grain and interior fittings for ships, and Arezzo contributed armor, weapons and grain. Perugia, Chiusi, and Roselle sent grain and fir for shipbuilding, and Tarquinia sent linen for sails (see [chapter 68](#) de Angelis). A few observations can be made on the significance of this inventory. First, a large quantity of products was available in Etruria and these goods could be transported across long distances. Second, each city-state and its territory contributed specific products—presumably those that were characteristic of each region or in particular abundance there. The timber of Etruria certainly was abundant, whether it was called on for furniture, ships, containers, pitch, or charcoal for industry (such as the metal industry; e.g. Strabo 5.2.5). We are told that six different city-states contributed grain, a fact that is of great interest given that the combination of intense wartime need within Etruria together with the amount exported for use

by the Romans most probably indicates the existence of a substantial surplus; however, we cannot be certain just what the needs of Scipio Africanus might have been for this fleet.³³²²

1Populonia's continued strength

The metal ores that made Populonia so prosperous and successful in previous periods continued to be mined in the Hellenistic period, producing a large amount of leftover slag (see [chapter 26](#) Corretti). Indeed, it was probably during the Hellenistic period when that vast amount of industrial refuse was dumped over the necropolis of San Cerbone, which lies adjacent to the Gulf of Baratti.³³²³ This action represents an interesting search for space since the San Cerbone necropolis contained tombs ranging in date from the Orientalizing to the Classical periods.

Populonia continued to be a vital port well into the Roman period and remained important as a source of Elban ore. A shipwreck found at Pozzino in the Gulf of Baratti testifies to the international orbit that Populonia continued to enjoy. The cargo of this wreck included a small amount of boxwood for spices or essence (presumably from the east), a Pergamene West Slope Ware cup, and other vessels from the eastern portions of the Mediterranean.³³²⁴ It also contained more than thirty Rhodian amphorae from around 150 BCE, which had once held wine and came to be refilled with dates. The ship also carried iron ingots, which means that the ship was presumably wrecked soon after loading its cargo at Populonia. Not only did Populonia's resources attract the interest of foreign merchants, they also promoted international trade – including exchange with southern Italy – as demonstrated by the ceramics found on site.

From the third to the first centuries, a significant quantity of the wine imported to Populonia came from Campania, as shown both by amphora shapes and epigraphic evidence.³³²⁵ In spite of a booming industry in neighboring Volterra, one third of the black gloss pottery thus far found at Populonia (dating from the second and first centuries) originated in Campania. A passage from Diodorus Siculus may shed light on the ancient relationship between Campania and Populonia (see [chapter 55](#) Becker). Diodorus explains that merchants exported the smelted Elban ore to Dicaearchia or other *emporía* to be worked.³³²⁶ Dicaearchia was founded around 530 BCE and might have been a destination in the Late Archaic period. But by the Roman period, this site was called Puteoli and was the most important Roman port on the Tyrrhenian coast. Puteoli may have been a very important “Mediterranean middle man” in the export of Elban ore at this time, so that its local products, as well as foreign goods collected from other ports, would have been even more likely to be brought from this Roman port to

2Property and property divisions

Beginning in the eighth century, almost as soon as the Etruscans adopted an alphabet, they found it useful to label portable property with their names.³³²⁷ It was only much later in Etruscan history that Etruscans used inscriptions to mark their land. Two boundary stones found near Perugia (Bettona) denote the property boundary (*tular*) of the Larna family: *tular larns* and *tular larna*.³³²⁸ These stones, dating to the fourth and third centuries, are part of a larger group of boundary stones found in northern Etruria and beyond, which served the purpose of separating one area from another. Stones marked the *tular spural* of Fiesole, the boundaries of the city, and the *tular rasnal* of Cortona, the boundaries of the city's early *ager*.³³²⁹ These latter stones do not mark property ownership *per se*, but rather religious and juridical boundaries. These property divisions were so popular that an even more generic boundary marker was found in Spina, stating *mi tular*, "I am a boundary."³³³⁰ Presumably when it was first set in context, it was well known whether the boundary being delineated was public or private.

The religious background for such boundaries is firmly rooted in Etruscan doctrinal practice. Rituals existed, such as the use of a plow to found and demarcate a city's boundaries, which the Romans termed the *sulcus primigenius*. There is also the example of the prophecy of the nymph Vegoia—which specifically advised against moving the boundary stones set by Iuppiter; this prophecy also demonstrates that demarcation had ritual import.³³³¹ Private boundaries were important to the Etruscans, too, which is clear from the *Etrusca disciplina*, the collected body of religious knowledge, which once included a *liber iuris terrae Etruriae* ("book of the law of the land of Etruria").³³³² And while nothing is known about this book regarding its date or specific content, two Etruscan contracts dealing with land possession do exist.

These two contracts, both of the Hellenistic period, reveal a good deal about property ownership. The first contract is the *cippus* of Perugia (third to second cent. BCE), which deals with a boundary dispute recorded on a boundary marker that delineated the adjudicated property.³³³³ This inscription addresses the adjudication of the rights of the families of Larth Afuna and Aule Velthina. Among other things, the inscription details the sharing (or use) of Aule Velthina's property with (or by) Larth Afuna. The *Tabula Cortonensis* (late third to early second cent. BCE), inscribed on a bronze tablet discovered in 1992, also preserves a contract between private people (Fig. 38.2). The Cusu family and Petru Scevas worked out an arrangement concerning the purchase or sale of property.³³³⁴ These contracts allow a privileged look into

real estate owned by individuals and families. Both contracts have an official character, even bearing the names of witnesses. Both contracts deal with precise measurements (adding to their legal character), and the cippus even mentions the term *tularu*, “boundary.” The *Tabula*, on the other hand, has an eponymous date and even has instructions for storing copies of the inscription in private homes for safe-keeping.³³³⁵ A third inscription of potential economic import comes from Tarquinia. This inscription, preserved on a bronze tablet, is only partially legible but does have an eponymous date and seems to be a legal document dealing with a member of the Clevsina family.³³³⁶

These documents, preserved on permanent materials, may reflect many others (such as the copies of the *Tabula Cortonensis* stored in private homes) that may have been recorded on less durable materials. These documents raise many questions about property ownership in the Hellenistic period, and indeed also for earlier periods, from which such contracts have not survived. In legal terms, these inscribed texts also offer important insight into the overlap between public and private law, a topic that is of course better attested in the Roman world, but one that clearly was important in Etruria. This intersection is key in terms of demonstrating the state’s interest in the legalities of land ownership, transfer, and demarcation.

3Population and the changing rural economy

In certain areas of Italy, lands recently annexed by Rome remained the center of ongoing debate—especially with respect to the issue of the allocation of lands classified as *ager publicus*. Rome’s interest in settling both the urban poor and discharged military veterans on these lands resulted in conflict and demographic change. This debate transpired at the same time as other important population-related developments. The Italian population boom—both within the city of Rome and in central Italy—demanded an increase in food production to provide sustenance to the burgeoning populace and avoid famine. In the Roman system, large slave-run estates referred to as *latifundia* began to appear. Aristocrats, often of the senatorial order, owned these large-scale estates that required large numbers of slaves to work the fields; it is no coincidence that increasingly large numbers of slaves were arriving in Italy as a result of Rome’s eastern conquests. The study of this Hellenistic productive model has fueled a vast twentieth-century scholarship focused on the so-called “Slave Mode of Production,” a Marxist-inspired agenda with an interest, above all, in the enslaved and working classes.³³³⁷ This land-use trend did not, however, impact all areas of Etruria in the same way, which has important implications in considering the economy, labor force, and population of Etruria during this time. The areas most affected by Roman colonization were

the coastal areas, as well as regions close to the frontiers of Roman territory.

In 274 or 273, the Romans claimed one half of Caere's territory.³³³⁸ Three maritime colonies were founded shortly afterward by Rome: Castrum Novum (264), Pyrgi (ca.264), and Alsium (247).³³³⁹ Field survey data suggest that population levels in the territories of Caere and Tarquinia increased dramatically during the third and second centuries as rural areas became more densely occupied.³³⁴⁰ Some of these increases might be attributable to Gracchan land settlements (see below), such as a *Colonia Tarquinia* attested in the *Libri coloniarum*, which is suspected to be in Tarquinia's hinterland (and not a re-foundation of the city itself).³³⁴¹ These sites would have helped the economy of Rome's expanding hinterland in two ways, both because they were situated along the coast (allowing increased access to maritime traffic) and because they flanked the *Via Aurelia*, Rome's important northern coastal trunk road. Annalisa Marzano notes that local amphora production can be documented near Gravisca and Pyrgi, which would have accommodated the surplus production of local wine, whether it was produced by Roman or Etruscan farmers.³³⁴²

In 137, Tiberius Gracchus famously traveled through Etruria on his way to Spain, finding the land depopulated and farmed by barbarian slaves (Plut. *Ti. Gracch.* 8.7). This state of affairs encouraged Gracchus to circulate the news in order to support his plans to find land for Rome's urban poor. The increased Roman presence, combined with the testimony supplied by Plutarch, does not necessarily mean that Etruria was full of *latifundia*, the large slave-run villas popular in Late Republican times.

In traveling to Spain, Tiberius Gracchus would have proceeded along the *Via Aurelia*, which passed through Roman territory and many Roman colonies. In the *Ager Cosanus*, for example, through which Gracchus would have had to travel, he would have seen not only large estates, but also small and medium-sized farms.³³⁴³ And while settlement patterns and the process of Romanization vary widely both across Etruria and over time, a similar scenario is found in some other parts of Etruria (see [chapter 65](#) Marcone). For example, the number of small and medium-sized farms continued nearly unabated in areas such as the Mignone Valley, the Tiber Valley, and the Cecina Valley, even after those areas fell under Roman rule.³³⁴⁴ In areas where small and medium-sized farms were located next to large estates (and, of course, large estates were not omnipresent in the increasingly Romanized Etruria), it is possible that these sites could have shared resources.

Two small rural sites in the Cecina Valley do not reflect any disruption in settlement patterns brought on by the Roman conquest, a disruption that some earlier scholars have presumed existed in this period. Instead these sites speak to the survival of traditional small and medium-sized farms even after Romanization. The Cecina Valley farm sites of San Mario (fourth century BCE–fourth century CE) and Podere Cosciano (third century BCE–fifth century CE) both continued to be occupied until late antiquity, with a

reasonably consistent material culture throughout.³³⁴⁵ While these farm sites were not significantly altered, it remains impossible to say whether the owners (or even the ethnicity of the owners) changed over time. In terms of lifeways, the patterns appear to be quite consistent. In addition, it is difficult to document the ethnic ownership of properties such as these farms without epigraphic evidence. An example is the Roman villa at Ossaia (Cortona) that was owned by an elite Etruscan family (*Vibii Pansae*) that had significant connections to Rome, and then came to be owned by Gaius and Lucius Caesar.³³⁴⁶ Another is the farm near Tarquinia owned by the wife of the elite Volterranean Aulus Caecina, the ownership of which was contested by the Roman Sextus Aebutius (Cic. *Caecin.*). Certainly all four of these sites represent the layered Roman and Etruscan occupation of Etruria that occurred increasingly from this period into the Roman era.

68External Relationships, 250–89 BCE

Abstract: From 250 to 90 BCE, the external relationships of Etruria underwent both a process of radical simplification and a major change in nature. Before the military defeat at the hands of Rome and their incorporation into the latter's system of unequal alliances, Etruscan cities had conducted external affairs independently from one another, often with diverging perspectives and aims. The establishment of Rome's hegemony over Etruria in the first half of the third century BCE caused Rome to become the main—if not the only—term of reference for all Etruscan cities in matters both military and political. Etruria's subordination to Rome, however, did not imply a passive acceptance of the latter's political and military perspective. The analysis of representations of enemies (Celts, Carthaginians) in Etruscan art suggests that the relationship was one of convergence rather than of coincidence. In the second century, there is no evidence for any specifically Etruscan peculiarity in the handling of external affairs, and the main evidence about the relationships with non-Etruscans comes from the cultural sphere.

Keywords: Celts; Carthaginians; Hannibalic wars; Romanization

Introduction

From 250 to 90 BCE, the external relationships of Etruria underwent both a process of radical simplification and a major change in nature.³³⁴⁷ Before the military defeat at the hands of Rome and their incorporation into the latter's system of unequal alliances, Etruscan cities had conducted external affairs independently from one another, often with diverging perspectives and aims. From the point of view of the individual communities, external relationships in the strictest sense concerned not only ethnically different groups, such as Romans or Gauls, but also other Etruscan cities. Unfortunately, the Romanocentric perspective of Livy's account of fourth- and early third-century history does not provide direct evidence for relationships between the Etruscan cities, and only allows us to make inferences based on his information about the diverse and shifting attitudes of each of them towards Rome. However, the well-known scene from the François Tomb, which features a group of armed companions led by the Vulcentan hero Avle Vipinas as they conduct a surprise attack on a coalition of enemies from other cities—both Etruscan and non-Etruscan—likely echoes the fourth-century political constellations in mythological guise.³³⁴⁸

The establishment of Rome's hegemony over Etruria in the first quarter of the third century, followed by its consolidation after the destruction of Volsinii

in 264, as well as its re-foundation as Volsinii Novi, caused Rome to become the main—if not the only—term of reference for all Etruscan cities in matters both military and political. Divisions and differences between Etruscan cities did not disappear, but they became largely irrelevant. The best piece of evidence for this is the information about the support given by the communities of central Italy to Scipio Africanus’ campaign against Carthage in 205:

“First the Etruscan communities promised that they would aid the consul, each according to its own resources. The men of Caere promised grain for the crews and supplies of every kind, the men of Populonium iron, Tarquinii linen for sails, Volaterrae the interior fittings of ships, also grain. Arretium promised three thousand shields, an equal number of helmets; and that they would furnish a total of fifty thousand javelins, short spears and lances, with an equal proportion of each type; also axes, shovels, sickles, baskets and hand-mills, as many as were needed for forty war-ships; a hundred and twenty thousand pecks of wheat also; and that they would contribute allowances 3 for petty officers and oarsmen. Perusia, Clusium and Rusellae promised fir for shipbuilding and a great quantity of grain.”³³⁴⁹ (see [chapter 67](#) Becker)

As Livy’s text makes clear, each city contributed according to its own craft specialization and economic capacity. This differentiation, however, which was now put into the service of Rome’s projects, no longer carried strong implications on the political level. Almost paradoxically, from the mid third century onward, treating Etruria as a unitary historical actor from Rome’s point of view, no longer presents a problematic distortion as it had previously. It is perhaps not coincidental that precisely in this period several new representations of Etruscan myths and legends occur in the archaeological evidence, testifying to a new sense of communal identity. What is striking is not the occurrence of these myths per se, but the fact that they are not bound to one particular center. For example, the Vibenna brothers, who appear to be connected with Vulci in the first place, are also attested in Volsinii, Clusium, Volaterrae; and so is the seer Cacui, who plays a role in the Vibenna legend and for whom there is evidence from Perusia, in addition to the cities just mentioned. Similarly, the anonymous Etruscan “plough hero” is known from both Clusium and Volaterrae. The diffusion of these myths suggests that it is not their local dimension that matters, but rather their potential to appeal to a wider Etruscan (if not pan-Etruscan) public.³³⁵⁰

1Reactions to invaders: the Celts and the Carthaginians

The Etruscan subordination to Rome, however, did not imply the former’s passive acceptance of the latter’s political and military perspective. We should

understand the relationship to be one of convergence rather than of coincidence. This situation is especially apparent in the initial phase of the period under consideration, when the system of relationships was still comparatively new. The most indicative of such phenomena are the Etruscan reactions to the Celts and the Carthaginians, as they are attested in both visual and literary sources.

The last third of the third century saw an unprecedented proliferation of images with Celts, especially in funerary art. Scenes of battles against the Celts, images showing them plundering a sanctuary and being repelled by divinities, and allegories where Celts or Celtic elements are attributed a symbolic value—such representations are often attested on the cinerary urns and sarcophagi of northern Etruria, and especially in Clusium (Figs. 68.1., 68.2).³³⁵¹ Iconographic parallels, especially those of the Celts as pillagers, are often attested on artifacts from other centers in Italy—most notably, the ceramic relief vessels from the Latin colony of Cales in Campania and the frieze of Civitalba in the Marche.³³⁵² This coincidence apparently indicates the adhesion to a Roman point of view by the Etruscans in their definition of the “Other” as threatening, dangerous, and sacrilegious. Particularly so, since the other examples come from areas that have strong links with Rome. The most eloquent confirmation of such a hypothesis is to be found in Polybius, where he describes the reactions to the Gallic invasion in Italy that eventually led to the battle of Talamone in 225:

“There was universal terror in Rome, for the danger threatening them was believed to be great and formidable. And naturally so: for the old fear of the Gauls had never been eradicated from their minds. No one thought of anything else: they were incessantly occupied in mustering the legions, or enrolling new ones, and in ordering up such of the allies as were ready for service. [...] From every side assistance was eagerly rendered; for the inhabitants of Italy, in their terror at the Gallic invasion, no longer thought of the matter as a question of alliance with Rome, or of the war as undertaken to support Roman supremacy, but each people regarded it as a danger menacing themselves and their own city and territory. The response to the Roman appeal therefore was prompt.”³³⁵³

Fig. 68.1.: Sarcophagus with Celtomachy, from Chiusi, last quarter of the third century. Florence, National Archaeological Museum (Photo SAT 28075)

This passage famously introduces the list of Italian allies of the Romans, including a calculation of the amount of troops contributed by each of them—a piece of information that ultimately goes back to the *formula togatorum*, the Roman mustering list, which might have been set up for the first time precisely on this occasion.³³⁵⁴ The Etruscans are mentioned alongside other Italic peoples by Polybius, and appear to be fully integrated within Rome's perspective. Particularly significant is the historian's reference to the *metus Gallicus*, the archetypal Roman fear of the Gauls as the dangerous enemy *par excellence*; here it is said to be shared by the Italian allies as well.³³⁵⁵ Indeed, the scenes featuring Celts on the Etruscan funerary monuments have a comparable emotional charge. They are frightful representations of turmoil and chaotic events that threaten to disrupt the normal order. The adoption of such an image of the Celts is all the more significant since Etruscans and Celts had just recently fought on the same side against the Romans, even though unsuccessfully, at the battles of Sentinum (295) and lake Vadimo (283).

Fig. 68.2: Cinerary urn with horseman and Celts, last quarter of the third century. Chiusi, Tomba della Pellegrina (Photo SAT 63632–2.)

As suggested both by Polybius and the monuments, however, the alignment of the Etruscans with Rome's perspective was not the only factor at play in their perception of the enemy. Polybius explicitly states that the Italian *socii* of the Romans were first and foremost anxious about their own cities and territories. The acceptance of Rome's hegemony was the almost unintended consequence—rather than the cause of—the emotions triggered by the Celts. Similarly, despite all affinities, many of the Etruscan funerary monuments display scenes that could hardly be reconciled with what we know about Roman triumphal imagery. In many cases the represented battles do not have a clear winner (Fig. 68.1); the uncertainties of fighting rather than the celebration of victory are their main theme. Moreover, even those scenes that show warriors prevailing over the Celts do not show a univocal laudatory

character. The best example is provided by a series of urns from Chiusi that feature a horseman who is about to pierce with his spear a kneeling or fallen Celt in front of him. Despite his state of inferiority, the latter is consistently shown thrusting his sword into the chest of the horse (Fig. 68.2). The victory of the horseman, therefore, is far from unconditional. Given that these images were used for female burials just as often as for male ones, they are unlikely simply to have commemorated the heroic deeds of the deceased. Rather, they probably served to connote the fears concerning the potential diminishment of one's status caused by death, in analogy with the loss of the horse, as well as to implicitly evoke the dangers associated with traveling to the underworld.³³⁵⁶ Such usage of the memory of military events in the sepulchral context in late third-century Etruria stands in contrast with what we know from coeval Rome. Monuments such as the frescoed tomb of Fabius (or Fannius) from the Esquiline show much more explicit affinities with the imagery of the public sphere.³³⁵⁷

The differences between Etruria and Rome in visualizing military interactions with foreigners are at least partially due to the different ways in which autonomy in external affairs, or the lack thereof, affected the internal political and social situation. In Rome, success in war entailed immediate and very visible benefits for the city and the community, and thus represented a major prerequisite for a successful political career and the legitimation of status. The same could not have been the case in allied Etruria, where the victorious outcome of a military endeavor did not contribute directly to the aggrandizement of one's own city. This does not mean we can rule out the possibility that the Etruscan elites used the military sphere to reinforce their social superiority. Nevertheless, the aforementioned peculiarities in the funerary imagery of battles clearly suggests that the new order in Etruria made the historical experience of war available for purposes other than political celebration.

Such a distinction between Roman and Etruscan perspectives with regard to external relationships can be confirmed by considering the other major military enterprise on Italian ground in the late third century—that is, the Hannibalic wars.³³⁵⁸ In this case, the evidence is literary rather than visual. Direct impact of Hannibal's army in Etruria was limited to the very initial phase of the war. The territory of Cortona was subject to plundering by the Carthaginians and their allies on the occasion of the battle on the lake Trasimene in 217. Soon thereafter, Hannibal left Etruria and the region did not witness any further attacks by him. The reasons for his absence from Etruria are debated. It could either be due to the awareness of Etruria's basic loyalty to Rome, or an attempt to ingratiate himself with the Etruscans by keeping the theater of war away from the region. In any case, Livy reports several episodes in the following years that suggest Etruscan dissatisfaction with Roman rule.³³⁵⁹ Such dissatisfaction need not have been a widespread one. These episodes should be seen in the context of the wider challenges that the

Carthaginian presence raised against Rome's hegemony in Italy, and cannot be generalized. Nevertheless, they indicate that Etruscan and Roman perspectives with respect to Hannibal did not coincide. It is quite significant that no battle scenes involving Carthaginians occur in Etruscan art of the period. The Punic wars did not trigger fears in Etruria, comparable to the *metus Punicus* of the Romans, and consequently, the Etruscans did not perceive the Carthaginians to be their archetypal enemies as it was the case with the Celts.³³⁶⁰ The only Etruscan image that may be linked to the Hannibalic wars—a numismatic series, mainly found in the Valdichiana area, with the head of an African on the obverse and an elephant on the reverse (Colour plate 12)—has been interpreted in diverging ways, as an expression of either philo-Punic or anti-Punic sentiments.³³⁶¹

On the practical level, however, the distinction of the Etruscan perspective from Rome's one did not have major military consequences. As already mentioned, all major Etruscan cities did contribute to Scipio's successful expedition to Africa in 205. And the only other military event for which Etruscan participation is explicitly recorded, attests to them heroically fighting on the Roman side. This is the siege of Casilinum, the town near Capua, in 216–215. Troops from Perugia and Praeneste resisted against Hannibal for several months before negotiating a honorable surrender—an episode possibly alluded to in the famous funerary inscription of Laris Felsnas, an Etruscan of northern origins, buried in Tarquinii at the age of 106 years.³³⁶² In a sense, therefore, the Hannibalic wars represented the litmus test for Etruria's loyalty to Rome's line. It is not by chance that the highest concentration of battle scenes in the funerary art of the Etruscan elites dates to those years, that is, in the last period when an autonomous stance of the Etruscan cities was conceivable, at least in principle. By the second century, the military domain does not provide evidence for any Etruscan peculiarity in their handling of external affairs. Instead, the main evidence for their relationships with non-Etruscans comes from the cultural sphere.

2Etruscan culture and foreign cultures

The relevance of the cultural dimension in the Etruscan relationships with foreigners is already evident in the images of enemies discussed above. The proliferation of Etruscan representations of Celts, as opposed to the complete absence of those of the Carthaginians, is not simply due to the different perception that the Etruscans harbored against them. On the other hand, it is also linked to the role of the Celts in contemporary Greek culture and art. As it is well known, since the early third century, the Galatian invasions in Greece and Asia Minor had had a profound impact on the Greek imagination, triggering a flowering of discourses, images, and rituals, which echoed in

many corners of the Mediterranean.³³⁶³ In fact, the majority of the iconographic features that occur on Etruscan funerary monuments resonate with what we know of the Greek imagery of that period. It is therefore quite likely that the representations of Celtomachies were not simply a way for the Etruscans to express the emotions related to their own historical experiences; it also allowed them to make sense of these experiences within the broader ideological and conceptual frame of the Hellenistic world. In other words, they were a means to establish cultural connectivity to, and thereby reassert Etruscan participation in, the contemporary Greece-driven discourse on civilization.

Etruria's relationship with Greek culture was a long-established fact, and it was by no means an innovation of the mid Hellenistic age. The new factor here, however, was the growing role of Rome, which was not only attracting Greek architects and artists in increasing numbers, but through military expansion and looting it was becoming the main actor in providing a direct contact with Greek historical art and culture.³³⁶⁴

Nonetheless, the degree to which Etruria's relationship with the Greek world was conditioned by Rome's mediation is indeed questionable. It is true, for example, that several features on the funerary urns from northern Etruria find more or less close echoes in Rome. Scholars have compared the classicizing tendencies seen in the portraiture on Volterranean urn lids of the second half of the second century to the so-called neo-Attic artistic trends in Rome. Similar instances of attenuated pathos, including the visual formulae connected with *revixit-ars*-artists, also occur in the figural scenes on the caskets of the urns.³³⁶⁵ More generally, the chosen mythological themes for decorating the urns are broadly comparable to those popular in Roman theater; some scholars have even postulated an influence of Roman funerary spectacles on corresponding Etruscan practices.³³⁶⁶ Even the use of "baroque" and Pergamene stylistic features has been attributed to the presence of artisans brought to Italy by Roman generals.³³⁶⁷

Yet, all these phenomena should be understood in terms of a generic convergence rather than a direct imitation from Rome. The attenuation of pathos, for example, is not particularly a feature with Roman origins, but involves more generally Greek Hellenistic art. Moreover, given that there is no systematic and consistent use of classicizing principles detectable on the urns, some of the aforementioned features may be explained in terms of formal developments internal to the urn workshops.³³⁶⁸ Similarly, many of the myths attested on the urns occur in Etruscan art (as well as in southern Italian funerary art, for that matter) well before the third century; and the evidence for Etruscan comparanda to Roman funerary games is scanty at best.

Quite significantly, several elements that count among the most distinctive features of the Roman reception of Greek art in this period are absent in Etruria. To name only the most eloquent examples, second-century Etruscan temple architecture displays none of the innovations brought about in Rome

by the presence of Greek architects such as Hermodoros of Salamis, the author of the peripteral marble temple of Jupiter Stator in the Porticus Metelli and of Mars in *Circo*.³³⁶⁹ And conversely, a striking new feature in Etrusco-Italic architectural decoration, the multi-register composition of the pediment of Talamone, is not attested in Rome or in any other areas directly influenced by Rome. Likewise, the increased usage of marble in Roman art and architecture does not cause intensified exploitation of the Luna quarries by the Etruscans. While Carrara marble is indeed used for Etruscan Hellenistic monuments, it remains a local phenomenon and, as its usage is already attested in the Archaic period, it is clearly not a reaction to Rome's example.³³⁷⁰ Hellenizing features in Etruscan art should, therefore, not be understood as covert signs of Roman cultural influence, let alone of Romanization. Rome's traces in the cultural sphere in Etruria were restricted to very specific domains, especially in those areas that were in closest contact with Rome. So, for example, the use of abbreviations in the filiation of onomastic formulae (i.e., the use of "c." and "s." for *clan*, "son", and *sech*, "daughter") in the funerary epigraphy of Caere was a direct imitation of Roman conventions, and it is certainly to be seen in conjunction with the special status of this southern Etruscan city as *municipium sine suffragio*, since the fourth century.³³⁷¹

This relative autonomy from Rome with respect to Etruria's cultural relationships with Greece, however, does not imply any serious form of resistance on the part of the Etruscans. The colonies and prefectures founded on former Etruscan territory, the consular roads that ran through Etruria, and the individual enfranchisements of Etruscans—and their occasional acceptance into the Roman senate—were all factors that contributed to a growing integration.³³⁷² The Etruscan opposition to the laws of M.Livius Drusus in 91, on the eve of the Social War, was mainly directed against the possibility of a redistribution of land, and does not seem to have been driven by considerations concerning Roman citizenship. As a matter of fact, even though the Etruscans appear to have joined the rebels for a short time in 90, they readily (if not "happily," as stated by Appian) accepted Roman citizenship under the conditions of the *lex Julia de civitate*.³³⁷³ From that point on, the history of the Etruscan cities became an integral part of the history of the Roman state, and their external relationships only survived in the domain of historical commemoration.³³⁷⁴

V. Topography of Etruria

Philip Perkins

69The landscape and environment of Etruria

Abstract: Etruria, homeland of the Etruscans, lies on the western coast of Italy to the north of Rome between the Tiber and the Arno rivers. This hilly region is defined by its low-lying coast and the rugged Apennine mountains to the north and east. Since the Etruscan period the sea level is little changed but there has been significant soil erosion modifying the hills and valleys. The climate in the Etruscan period was similar to today's but human action has modified the vegetation cover. To conclude, the major landscape zones of Etruria are briefly described.

Keywords: geology, mountain, river, drainage basin, environment

1General location

Etruria, homeland of the Etruscans, lies on the western coast of Italy to the north of Rome (Fig. 69.1). Its approximate boundary to the south and west is the Tiber River, which flows from Monte Fumaiolo in the Casentino through northern Umbria past Perugia and Orvieto and then to Rome and the sea at Ostia. To the north, Etruria is approximately bounded by the Arno River flowing from Monte Falterona past Florence and Pisa to the sea. To the west, Etruria is washed by the Tyrrhenian Sea, part of the Mediterranean Sea enclosed between Italy and the large islands of Sardinia, Corsica, and Sicily. Off shore lies the Tuscan archipelago, an arc of small islands the largest of which are Giglio, Elba, and Capraia. These, along with Corsica, are all visible from the mainland.

In general terms, the sea level along the coast of Etruria over the past 4,000 years has been stable, with an estimated change in effective sea level from approximately -2.0 m to -1.0 m below present levels, between 4,000 and 2,000 years before the present.³³⁷⁵ Compared to the contemporary coastline, sea levels not much more than 1.0 m lower than present will have created only localized differences in the shoreline or susceptibility to inundation, given that the tidal range in the Tyrrhenian Sea is approximately 0.4 m. Sea currents tend to circulate clockwise around the Tyrrhenian Sea.

Fig. 69.1: Altitude and mountains in Etruria

2Geology and Geomorphology

The northern part of the Italian peninsula was shaped by two ongoing geological processes. In the Mesozoic period (approximately 250 million–56 million years ago), sedimentary rocks formed in the Tethys Sea which lay between landmasses that were to become the continents of Europe and Africa. Toward the end of this period, the tectonic collision of the African and European plates caused these rocks to be formed into mountains, and a complex process of folding and faulting created the Apennine Mountains. As part of this process, the earth's crust to the west of the Apennines was

stretched and fractured in a series of faults that created the northwest-to-southeast ridges and valleys that provide structure to the Eastern parts of Etruria, through which now flow the Tiber, Arno, and the Val di Chiana. These separate the Apennine mountains from the mountains of Tuscany and Lazio that are sometimes called the Pre-Apennines or Anti-Apennines.

In the southern part of Etruria, this basic structure is overlaid by volcanic hills and plains created by a sequence of volcanic activity between 600,000 and 90,000 years ago. Although now extinct, the volcanoes are still visible in the landscape. The Alban hills south of Rome preserve the typical conical shape of volcanoes, and lakes now fill their calderas at the mountaintops. In southern Etruria, volcanic lakes and the remains of volcanoes punctuate the landscape at Lake Bracciano, Lake Vico and Lake Bolsena. These craters are surrounded by a thick layer of pyroclastic flows and ash deposits that have formed the *tuffo* rock characteristic of the region that extends over most of the lower Tiber valley and southern Etruria as far north as the Fiora River.³³⁷⁶

Farther to the north, in the center of Etruria but easily visible from Siena, is another older and larger extinct volcano, Monte Amiata, the highest point in Etruria (1,738m). Yet older volcanism is responsible for the volcanic dome of the Tolfa Mountains (579m) and the islands of Elba, Capraia, and granitic Giglio. Much of the remaining hilly areas of Tuscany are a complex mixture of Pliocene and Miocene clays, sandstones and marls, and Triassic schists. These were originally marine or lacustrine deposits, which were subsequently folded, faulted, and uplifted by tectonic activity.

The tectonic processes that have formed Etruria are still active, and earth tremors are common. However, in historic times, destructive tectonic activity (8+ on the Mercalli scale) has been rare outside the mountainous Apennine regions that form the boundaries of Etruria.³³⁷⁷ Less intense earth movements can cause severe damage in insubstantial stone and mud-brick Etruscan-type buildings and cause death and injury, but destructive or violent earthquakes are very unlikely to have been a significant cause of widespread devastation or socio-political change in Etruria.

The relatively soft geology of much of Etruria, along with torrential seasonal rainfall, has created a highly eroded landscape in many areas. Since the Pleistocene Period, ravines and canyons have formed in the relatively level volcanic *tuffo* landscape of southern Etruria. In other parts of Tuscany, erosion and gullyng of soft limestones, sandstones, clays, and marls, particularly when landscapes are deforested, has created steep V-shaped valleys and dissected ranges of hills. Nearer the coasts and in wider valley bottoms, the eroded material has accumulated as thick, level deposits of colluvium (hillwash) and alluvial deposits (river-borne silts). In many areas, mixed deposits of clays with other rock types create ideal conditions for landslips, particularly in areas of steep slopes or already eroded land. These actively eroding landscapes have led to the filling of valley bottoms, so that they typically have steeply sloping sides and wide, flat bottoms. Repeated

phases of deposition and down-cutting have often caused series of river terraces to be created on the flanks of the valleys. Such erosion has been accelerated over the past 5,000 years due to human action causing deforestation, which is often linked to agricultural activity or demand for timber. As a result, the presence of ancient sites in valley bottoms is highly likely to be masked by later deposits that have prevented their discovery by techniques such as field survey and aerial photography. Landscape change of this type could well mean that sites from the early Etruscan period are underrepresented in the archaeological record because they have not been detected beneath thick layers of river sediment.³³⁷⁸ A further effect of this erosion has been the creation of small river deltas at the mouths of the Tiber, Ombrone, and Arno.

3Environmental change and vegetation

The climate, environment and vegetation in the Etruscan period were generally similar to those of the present day. The most significant difference has been caused by extensive clearance of lowland forested areas for agricultural purposes in the Roman and especially recent periods. This has been followed by soil erosion on hills and slopes. Another important change has been the draining of coastal areas, in the first half of the twentieth century, which has dried up coastal lagoons and marsh land and enabled the cultivation of areas that were previously pasture or uncultivated land.

The Tuscan climate is characterized by its strong seasonality with hot dry summers and cooler humid winters and most rain in spring and fall, but it varies considerably, particularly with altitude.³³⁷⁹ Lower areas have a typical Mediterranean climate, but higher land has a more temperate climate (see Table 1).³³⁸⁰

Evidence from lake cores, pollen records, and glacier advances suggests that Tuscany, in common with western Europe, experienced a cooler and wetter period in the first half of the first millennium BCE that was similar to current conditions and was followed by a warmer and dryer period until the third century CE.³³⁸¹ This climatic variation drove changes in the natural vegetation in the Etruscan period with an increase in the proportion of turkey oaks (*Quercus cerris*) and pines (*Pinus sylvestris*) and a decrease in the proportion of the more drought-tolerant holm oaks (*Quercus ilex*) and downy oaks (*Quercus pubescens*). These changes need to be seen in the context of a general reduction in tree cover that was caused by human activity from the Bronze Age onward. At the same time, there was an increase in the proportions of Mediterranean scrub (Fr. *maquis*, It. *macchia*) plants, such as juniper (*Juniperus*), and tree heather (*Erica arborea*), which are useful for making charcoal. Alongside these changes there was an increase in the

proportion of economically important cultivated and wild plants, particularly the olive (*Olea europaea*), vines (*Vitis vinifera*), sweet chestnuts (*Castanea sativa*), walnuts (*Juglans*), and hazel (*Corylus avellana*), matched by an increase in weeds of cultivation.³³⁸² Modern introductions, now common in Tuscany and Lazio, such as acacias, sunflowers, maize (corn), and tomatoes, would not have featured in the Etruscan landscape.

Table 1: Climatic and vegetation zones (adapted from Blasi et al. 1999, table 2 and Bartolini et al. 2008, table 1).

Zone	Mean temperature (°C)	Mean Summer temperature (°C)	Mean temperature in coldest month (°C)	Rainfall (mm)	Dry Period	Vegetation	Type
Coastal	15.5	26	3.5	616–826	3–6 months	Maquis, mixed oak / holm oak / cork oak woods	Mediterranean
Hilly areas near coast	15	28.5	3	813–1000	3 months	Maquis, turkey oak / mixed oak / holm oak / cork oak woods	Mediterranean
Hilly interior	14	26	1	962–1189	2 months	Chestnut woods, turkey oak / mixed oak / holm oak woods	Transitional
Higher hilly	13	26	1	1156–1397	1 month	Beech woods, chestnut woods, turkey oak / mixed oak / holm oak woods	Temperate
Lower mountain	11	21.5	1	1159–1447	0 months	Mixed deciduous woods, beech woods, chestnut woods, mixed oak / holm oak woods, spanish broom shrublands	Temperate
Upper mountain	7.5	21.5	–3	1430–1586	0 months	Beech woods, high altitude shrublands, mixed deciduous woods	Temperate

4Regions, districts, and land forms

4.1Coastal zone

The coast of Etruria forms a sub-region known as the Maremma. It is characterized by a low-lying coastal strip that rapidly transitions to steep hills, which would have been wooded, as most are now. Flatter areas of land only occur in the flanks of the river valleys where Pliocene or Pleistocene river terraces survive at a higher level than the contemporary river flood plains. Along the coastline, sea currents have created sandbars and coastal dunes parallel to the coast that caused lagoons to form. Together, in the Etruscan period, the river mouths and lagoons created an environment along the coast consisting of marshy areas and stretches of shallow brackish water that made the coastal strip narrower than at present. Few lagoons now survive, due to silting up as a result of soil erosion and human land drainage and reclamation activities. Only at Orbetello and Lake Massaciuccoli, near Pisa, are they of any size, but in Etruscan times the lagoons extended along much of the coast and were particularly extensive around the mouths of the Albegna and the Ombrone (ancient Lake Prile) and Pisa. At the mouth of the Ombrone, landscape change caused by the desiccation of Lake Prile has significantly affected the local environment of the hilltop Etruscan cities of Vetulonia and Roselle, which were formerly close to the shores of the extensive lagoon and are now much farther from access to the sea.³³⁸³ The low-lying coastal strip is divided into discrete areas at regular intervals where hills meet the sea directly. At Civitavecchia, the Tolfa hills close off the coastal strip that runs northward from the mouth of the Tiber. Continuing north, Monte Argentario and Poggio di Léccio separate the coastal strip around Tarquinia and Vulci from the Albegna Valley, which in turn is separated from the Ombrone valley by the Monti dell'Uccellina, and the pattern of alternating stretches of flat coastland and hill continues up the coast of Tuscany.

4.2Mountains

Other than the sea, the dominant geographic feature that defines Etruria is the arc of the Apennine mountains that encloses Etruria (Fig. 69.1). To the north and east, these high, rugged limestone mountains separate Etruria from the Po Valley and continental Europe and from the eastern coastline of Italy and the Adriatic Sea. To the south of the Tiber River, limestone mountains and the volcanic Alban Hills rise to between 1,000 and 2,000 m, completing the arc of

mountains that surrounds Etruria. Although the Apennines rise to between 1,500 and 3,000 m, there are many passes below 1,000m which provide crossing points in the mountain chain. Even if the Arno and Tiber Rivers form the traditional boundaries of Etruria, it is the mountains that define the region and local ecosystems.

In the northwest of Etruria, the Alpi Apuane rise steeply to nearly 2,000 m within 4 km of the sea. From there, the Apennines continue eastward, forming the northern flank of the Arno Valley. To the north of Florence, the upper reaches of the Sieve River form an upland basin, the Mugello, between the folds of the mountains, which creates a micro region between the Arno and the Po Valley to the north. Farther to the southwest, the upper reaches of the Arno Valley constitute the Casentino, a similar, inaccessible, mountain basin. The upper reaches of the Tiber, forming the traditional boundary of Etruria, also flow between high mountains. In contrast, Monte Amiata, in the center of Etruria, does not act in the same way as a barrier: river valleys tend to radiate from the mountain.

4.3 Drainage basins

Inland from the coast, Etruria is typically hilly. In southern Etruria the volcanic *tuffo* created a level plateau that has subsequently been eroded by torrential rivers creating deep ravines leaving long, narrow, and flat fingers of land between (Fig. 69.2). This landscape is characteristic of the areas around Viterbo and to the north of Rome. Farther north, the hills are dissected by steep valley slopes, and the only flat areas are valley bottoms.

In Etruria, the major river valleys of the Tiber, Ombrone, and Arno define the topography and natural divisions of the land. The Tiber drainage basin dominates the territories of the ancient cities of Rome, Caere, Veii, Orvieto, and Perugia. Large stretches of the river were navigable, perhaps as far inland as Orvieto. On the Etruscan bank of the river, a series of small rivers drains from the extinct volcanoes cutting across the *tuffo* plateaus either into the Tiber to the east or into the sea. The largest of these, the Arrone River, flows from the caldera lake of Bracciano to the sea between the mouth of the Tiber and Caere. Farther north, the Marta River drains the lake of Bolsena, which is otherwise enclosed by the volcanic crater rim of the Volsini Mountains, into the sea near Tarquinia. Northeast of the lake, near Orvieto, the Paglia River, the largest tributary of the Tiber, flows from the slopes of Monte Amiata in the center of Etruria to join the Tiber. The Paglia Valley rapidly narrows as the terrain becomes more mountainous. The Tiber itself flows from the east, cutting down from its wide valley in the folds of the Apennines which cross Umbria from northwest to southeast (Fig. 69.3).

To the west the minor rivers flow from the volcanic mountains toward the sea in a generally northeast-to-southwest direction. The Fiora River rises on

the southern slopes of Monte Amiata, flowing toward Vulci and the sea, approximately marking the boundary between the volcanic areas of southern and sedimentary areas of northern Etruria. Slightly farther west, the Albegna River flows from Monte Labbro to the sea just to the north of the Lagoon of Orbetello. The Ombrone is much larger and in the Etruscan period drained much of northern Etruria into Lake Prile, now dry, which lay in the plains around Grosseto. The Ombrone rises deep in the interior of Etruria near Siena and takes a winding route through the dissected and eroded landscape of Etruria's interior. Its many tributaries drain the northern slopes of Monte Amiata, the hills of Chianti, and the Colline Metallifere, creating a very extensive but heterogeneous drainage basin that incorporates much of central Etruria.

Fig. 69.2: Drainage basins in Etruria

Fig. 69.3: Major sites in Etruria (Rome and Ostia in Latium vetus)

Northern Etruria is defined by the Arno River. It rises in the Apennines and flows south, only to loop back toward the north enclosing the Prato Magno, a hilly area of woodlands and upland summer pastures. The river flows north through a wide and deep valley to the east of the Chianti hills. The convoluted course of the river was determined by a series of geomorphological changes in the drainage pattern of central Etruria. Initially, the Arno flowed south past

Chiusi through the Val di Chiana to become a tributary of the Tiber flowing from the north of Etruria. In the Pleistocene, this route reversed due to silting, and the Arno subsequently flowed north toward Florence. The Val Di Chiana is still a significant valley in central Etruria, and in the Etruscan period it was marshy and contained shallow lakes; now only the small Lake Chiusi and Lake Montepulciano have survived modern drainage schemes. Slightly to the west, between the Val Di Chiana and Perugia, is Lake Trasimene. At over 125 km² it is the largest lake in peninsular Italy, but it is extremely shallow (4 m deep), and its level—and therefore its size—fluctuates with varying rainfall: it is likely to have been larger in the Etruscan period.

Returning to the Arno, at Florence the river flows into a wide, flat-bottomed rift valley which is now largely occupied by Florence, Prato, and Pistoia, but was, in Etruscan times, dominated by Fiesole in the east and the newly discovered urban settlement at Gonfienti in the center. To the southeast, the Arno cuts through the ridge of the Chianti hills and Monte Albano and flows east toward Pisa and the sea. This lower stretch of the Arno flows through a wide valley that in historic times has been susceptible to flooding. Between Empoli and Montecatini lie the Fucécchio marshes, a former lake, and in the Etruscan period a branch of the Sérchio River (the ancient Auser) flowed into the Arno near Biéntina, creating an extensive marshy area. The low-lying area around Pisa would have been marshy with coastal lagoons in the Etruscan period, and today only Lake Massaciuccoli survives to the west of Lucca, near where the Sérchio now flows into the sea. To the south of the Arno the parallel Era and Elsa Rivers flow from the southeast to the northwest, connecting Siena and Volterra to the Arno Valley.

To the East of Volterra, the Cécina River flows directly to the Tyrrhenian Sea. The Cécina, along with the smaller Córnia, Pécora, and Bruna, drain from the Colline Metallifere into the sea, rapidly transitioning from steeply sloped valleys to the flat coastal strip. In the Etruscan period, the Bruna flowed into Lake Prile, along with the Ombrone.

70Southern Etruria

Abstract: Southern Etruria is the region between the Tyrrhenian coast and the right bank of the Tiber. It includes Veii, Caere, Tarquinii, the Faliscan and Capenate ager, Vulci and Vulcian territory as far as the Albegna Valley, Volsinii and the southwest area of Lake Bolsena centered around Bisenzio, and finally, Perugia and the Tiber Valley. The geomorphology of the region—with an accessible coastline with numerous landings and tufa plateaus of 150 or more hectares—encouraged the formation of cities and the development of important ports. Systematic excavations have identified Final Bronze Age and Early Iron Age settlements with proto-urban characteristics on tufa plateaus surrounded by outcrops with necropolises. Beginning in the second half of the eighth century BCE, settlements developed from proto-urban centers into historic cities, with the definitive organization of plateaus that were fortified in exposed areas, and elaborate necropolises, including fossa tombs, chamber tombs, and tumuli that reflected the gentilicial structure of resident communities. Aristocracies were clearly dominant in this period. Excavations have highlighted the flourishing of minor settlements in city-controlled territories, imitating Etruscan cities on a minor scale with plateaus of 5–10 ha and nearby necropolises. Between the Late Orientalizing and the Archaic periods, the progressive development of crafts, together with the increasing population of the countryside, supported the significant production of cereals, wine, and oil. These phenomena hint at the rise of social classes associated with agricultural production, manufacturing, and trade, which weakened aristocratic power and brought about major changes in the structure of the Tyrrhenian cities. Between the mid sixth and mid fifth centuries, these classes were governed by tyrant-kings who transformed the cities, introducing new cults and renovating the sanctuaries. The crises experienced by the coastal southern Etruscan cities from the middle of the fifth century brought urban social unrest until the power of the aristocracy was restored in the fourth century. During the fourth and third centuries, Roman expansion into Etruria caused the destruction and depopulation of most Etruscan cities. In some cases communities were transferred to other, less protected sites. During the Early Imperial period, the region declined and eventually became part of the Augustan Regio VII.

Keywords: Southern Etruria; cities and territory; urban plateau; necropolises; sanctuaries

Introduction

The concept of Southern Etruria as a defined area has been officially invoked in connection with the protection of antiquities in the Provinces of Rome and Viterbo, under the jurisdiction of the Soprintendenza Archeologia dell'Etruria Meridionale e del Lazio. In *L'antica Etruria marittima compresa nella dizione pontificia: descritta e illustrata coi monumenti* (1846), however, Luigi Canina also described an area bordered on the east by the Tiber and on the north by the Fiora Valley as *Etruria marittima*.³³⁸⁴ In this chapter the term denotes the area stretching from the Tyrrhenian coast to the right bank of the

Tiber, including Veii, Caere, Tarquinii, the *ager Faliscus* and Capena, Vulci and Vulcian territory as far as the Albegna Valley, and Volsinii and the southwest area of Lake Bolsena, centered around Bisenzio; Perugia and the Tiber Valley are also briefly discussed.

The region has remarkable geomorphology. The most favorable area for settlement is the Tyrrhenian plain, which extends approximately 120 km from the mouth of the Tiber to Monte Argentario behind a long, low strip of sand. The many lagoons in the landscape were originally fed by rivers that flowed at right angles to the coast, creating sheltered moorings; when the openings were obstructed, they became coastal salt lakes with abundant fish.³³⁸⁵

Besides Pyrgi and Gravisca, the most famous ports are found on the coast near Vulci, just north of the Albegna River. An Etruscan port (Portus Telamonis) with strong emporic features has been recognized behind Talamone, at Puntata di Fonteblanda, which now overlooks a filled lagoon connected with the settlement of Doganella. Ports farther south, at the mouth of the Chiarone, at Pescia Romana, and in the locality Le Murelle (Regae), suggest extensive coastal organization. A lagoon basin has also been hypothesized southeast of Caere overlooking the port of Alsium, which is noted in ancient sources together with Pyrgi and Punicum. The whole coast, however, is dominated by the wide mouth of the Tiber. In the Roman period, the river was navigable as far as Orvieto, connecting Rome, Veii, and even the Faliscan and Capenate territories with Mediterranean trade routes.³³⁸⁶

Inland, volcanic activity (at what are now Lakes Bolsena, Vico and Bracciano, Albano, and Nemi) has created excellent settlement conditions. Quaternary eruptions spread tufa, a compact, carbon-rich stone, easily excavated and hewn, between the Tiber Valley and the Ernici mountains. The deposition of tufa on clay and limestone, which is vulnerable to surface water and therefore unstable, has created a complex mosaic of wide tufa uplands resting on furrowed surfaces, typically with gently sloping sides, which are well-suited to intensive and extensive cultivation.³³⁸⁷ These plateaus measure 100–150 ha or more and provided favorable conditions for the formation of cities in the final phases of the Bronze Age. The plateaus of Caere, Tarquinii, and Vulci stand between 5 and 12 km from the coast and are surrounded by rocky outcrops (of marine origin at Tarquinii, but equally workable) that encouraged the excavation of wide necropolises with tumuli and chamber tombs.³³⁸⁸ Small inland tufa uplands (between 5 and 10 ha) were systematically occupied, first in the Final Bronze Age and then again in the Late Iron Age, by Etruscan settlements that were typical in particular of the area of the rock-cut tombs to the west of Lake Vico extending to the Biedano basin. Here, an upper class emerged that was effectively an aristocracy, whose members reproduced on a minor scale the processes already occurring in the cities, controlling minor settlements and the surrounding countryside through the formation of large estates worked by the lower classes and slaves.³³⁸⁹

“Territorial states” are characteristic of Southern Etruria, where the cities

exercised strong pressure on the surrounding countryside beginning in the Iron Age. Between the eighth and seventh centuries, they consolidated political and economic control over the countryside, imposing agreements and federations on minor centers and defining boundaries and spheres of influence. Massive population growth in southern rural areas is attested between the late seventh and early sixth century, as small settlements occupied arable land. This was the basis for the start of the Etruscan trade in agricultural products, particularly wine and oil for perfumes and ointments, which would reach ports and *emporia* in the western Mediterranean.³³⁹⁰ In the Archaic period, the territorial states were challenged by the growth of a middle class of artisans and merchants that was protected by regimes with tyrannical connotations, but they endured until the end of the sixth or the first half of the fifth century, when symptoms of a grave social and productive crisis appear that had serious consequences for the countryside and control of trade routes and effectively paved the way for Roman military and economic expansion.³³⁹¹

1Veii and the Faliscan and Capenate territories

Veii (Etr. **Veī*) is the Etruscan city most often mentioned in Roman sources. It dominated the middle and lower Tiber Valley and was essentially a mirror of Rome on the opposite bank of the river. The first historical events, set in the time of Romulus and the conquest of the *ager Romanus Antiquus*, concern the political structure of the city and feature regal figures shrouded in legend, such as Morrius and Propertius, or historical personalities such as Lars Tolumnius, king in 438 (Fig. 70.1).³³⁹²

Conflict with Rome began in the eighth century and aimed at control of the right bank and mouth of the Tiber, the latter with valuable salt and moorings. Romulus expanded Roman territory by annexing the *septem pagi* district; for a long time, Trastevere and the Janiculum area were considered frontiers with Etruria.³³⁹³

Fig. 70.1: Simplified distribution of archaeological evidence (quoted in the text), on the plateau and in the suburban area of Veii (drawing by the author)

Research has identified a complex system of settlements (fortified with

ditches and *aggeres*) between the Late Iron Age and the Orientalizing period. Some, such as the *oppida* of Colle Sant'Agata at Monte Mario and that on the Janiculum, known only through literary sources, were real outposts resisting Rome. Others were distributed in a line joining the settlements of Torre di Prima Porta on the Via Tiberina, Colle Ospedaletto, Acquafredda on the Via Aurelia, and Monte Roncione, to form a border controlled by the Etruscan city.³³⁹⁴

Veii stood on a plateau of 185 ha. Recent investigations have identified a core group of Final Bronze Age habitations on the small plain of Isola Farnese, which in the late phase of the period appear to have expanded to the major neighboring upland, which was bordered by the Valchetta (the ancient Cremera) and the Piordo streams. Final Bronze Age tombs at Casale del Fosso and Quattro Fontanili imply intensive occupation.³³⁹⁵

In the Early Iron Age, Veii underwent extraordinary development, indicated by the reception of Middle and Late Geometric Greek pottery. Necropolises at Casale del Fosso, Grotta Gramiccia, and Quattro Fontanili reflect a stratified community that intensively occupied the plateau and buried its dead in distinct cemeteries. Excavations conducted by Gilda Bartoloni at Piazza d'Armi since 1996 have clarified the development of an elite section of the community between the ninth and fifth centuries. Two Early Iron Age burials of young men have been found. The first lay in a curvilinear hut resembling a "funerary chapel," possibly to honor an ancestor, and was respected until a reorganization of the area in the mid seventh century. At this time the site changed drastically through the construction of new buildings aligned with orthogonal roads. Between the late seventh and the first half of the sixth century, a small *oikos* temple (excavated by Enrico Stefani in 1922), clearly continuous with the ancient "funerary chapel," was built, as well as other buildings that are still being studied and are likely to have had a residential and cult function. The site was further transformed from the middle of the sixth century, with the rebuilding of roads and the erection of craft structures, until its abandonment between the fifth and fourth centuries.³³⁹⁶

A defensive embankment from the first half of the eighth century has been brought to light at the northwestern gate. In the southern part of the plateau, at the Piano di Comunità, excavations following those by Rodolfo Lanciani in the late nineteenth century have recently uncovered a building atop a row of Orientalizing houses and Iron Age huts. The presence of a Iuno Regina sanctuary in the area has been hypothesized thanks to Late Archaic architectural terra-cottas. On the east and south slopes of the hill, structures dating from the second half of the seventh to the beginning of the fifth century that include cisterns, ditches, and kilns for pottery and votives can be interpreted as parts of Veii's main craft quarter.³³⁹⁷

Necropolises placed around the fortified plateau indicate that the community grew consistently in the Orientalizing and Archaic periods. Tufa *opus quadratum* walls with gates were erected in the sixth century. From the

northwest to the northeast, necropolises are located at Riserva del Bagno, Casale del Fosso, Grotta Gramiccia, Picazzano, Quattro Fontanili, Monte Michele, and Vaccareccia; and in the southwest, at Valle La Fata, Monte Campanile, Macchia della Comunità, Casalaccio and Pozzuolo. Those in the former group have more complex funerary architecture and grave goods. Fossa and *a caditoia* tombs with *loculi* for inhumations and grave goods become popular between the Late Iron Age and the Orientalizing period, with aristocratic males cremated at Monte Michele. In the latter group, in contrast, mid-level burials are attested from the middle of the seventh century.³³⁹⁸

Funerary architecture included exceptional examples of painted chamber tombs, some with animals inspired by Etrusco-Geometric pottery (e.g. the Tomb of the Roaring Lions at Grotta Gramiccia, dated to 690, and the Tomb of the Ducks at Riserva del Bagno, dated to the last years of the first quarter of the seventh century). The Campana Tomb at Monte Michele is special, with two axial chambers within the tumulus decorated with images of figures on horses and on foot accompanied by fantastic animals and wall-hung shields. The paintings stylistically resemble Etrusco-Corinthian works and can thus be dated to the end of the seventh century.³³⁹⁹

Several monumental tumuli date from the Middle and Late Orientalizing periods. They are generally set in suburban areas, near roads leaving the city (e.g. the tumulus at Vaccareccia or Monte Aguzzo, 5 km from the urban plateau). Funerary habits changed in the sixth and fifth centuries with the introduction of chamber tombs with a great trench, entrance steps, and *loculi* carved in the walls to hold vases of cremated ashes, with very poor or even no grave goods. The phenomenon can be explained by the adoption of sumptuary laws aimed at limiting ostentatious funerals, comparable with those of contemporary Rome.³⁴⁰⁰

Veii is known above all for its cult places. The suburban Portonaccio sanctuary, built on a terrace facing the Piordo stream, was discovered in 1914 by Ettore Gabrici and then excavated repeatedly until 1997. The site was in use from the mid seventh century and first hosted an open-air oracular cult of *Menerva* and other female divinities. The sacred area held a shrine and altar as well as a huge quantity of offerings (including Etrusco-Corinthian and bucchero pottery, and terracotta statues and votives); the importance of the oracle explains the attendance of worshipers from many south Etruscan centers, such as Caere, Vulci, Castro, and Volsinii. A great Tuscanic temple built in the late sixth century beside a large ritual pool had three *cellae* and two columns *in antis*. The temple decorations included several grand acroterial statues in an Ionian style, depicting and thus suggesting the worship of *Tinia/Jupiter*, *Apollo*, and *Hercle*, as well as an outstanding array of revetment tiles and antefixes to protect the wooden heads of the *columen* and *mutuli*. The decorations were made by craftsmen directed by the “Maestro dell’Apollo,” who, according to Giovanni Colonna, can be identified as the “veiente esperto di coroplastica” whom *Tarquinius Superbus* commissioned to

work on the Jupiter Capitoline temple at Rome a few years before 509. The complex underwent further modifications in the fifth century and remained in use until after the Roman conquest, when the temple was dismantled and the votives and terra-cotta decorations were buried; the *Menerva* cult, however, lasted until the second century.³⁴⁰¹ Several places in the city, particularly near the gates, are also characterized by cult places, including those at *Porta Caere*, Macchiagrande, and Campetti, which is known for substantial deposits of votive offerings in connection with the *Veii-Ceres* sanctuary (Fig. 70.2).³⁴⁰²

From the age of Romulus, the history of Veii was tightly tied to that of Rome. The sources speak of difficult relations at the start of the Republic, and in the fifth century, Veii, with the Faliscans and Capenates as allies, repeatedly attacked Rome. The massacre of the *gens* Fabia at the Cremera in 477 provoked an immediate Latin reaction. In 396, the Romans conquered Veii and took the Iuno Regina cult to Rome. Under Roman control Veii experienced a period of prosperity, with the repopulation of the countryside through land allocations to veterans and plebeians. From the second century on, the city gradually declined, despite the Augustan creation of the *municipium Augustum Veiens*. Finally, in 780 CE, Pope Hadrian I established an agricultural colony called the *domusculia Capracorum* in the countryside near Santa Cornelia, which survived until the thirteenth century.³⁴⁰³

Due to its proximity to the Tiber (which provided important access to the Sabine lands, Umbria, and northern Etruria), Veii controlled a wide territory ranging from the Arrone to the eastern shore of Lake Bracciano and the center of Capena. While the frontier with Rome seems to have been established by the Late Iron Age, boundaries with the *ager Faliscus* and Capena, centered around the Treja basin, seem to have been less well defined.³⁴⁰⁴ Settlements in this area resembled those of Etruria. Many small tufa uplands were sparsely occupied from the Final Bronze Age and often show continuity with the Early Iron Age. Population growth between the Final Bronze Age and the Early Iron Age was hampered by the formation of Veii, which affected the Faliscan countryside: myth holds that Halesus, the founder of Falerii, was an ancestor of the Veian king Morrius, and that Capena was founded by a group of young men sent by King Propertius.³⁴⁰⁵

Fig. 70.2: Veii: Experimental reconstruction of the great Tuscanic temple at Portonaccio (1993), with the nearby altar of *Menerva* covered by a roof (photograph by the author)

Population recovery is visible in the eighth century. The most important centers, Falerii (now Civita Castellana) and Narce, stand out in an area historically inhabited by people speaking Faliscan, a variant of archaic Latin widely documented in inscriptions beginning in the second half of the seventh century. The community at Capena instead spoke a language similar to that of the Sabines and was open to Etruscan and Sabine presence, extending into the Tiber Valley through the great inter-ethnic sanctuary of *Lucus Feroniae*.³⁴⁰⁶

Between the Iron Age and the Orientalizing period the *ager Faliscus* developed a funerary ritual with *pozzo* tombs, where the *olla* was used for the funerary urn, that was later succeeded by inhumation in *fossa* tombs with the dead deposited in tufa sarcophagi or tree trunks. The elaboration of Orientalizing *fossa* tombs with lateral *loculi* for the deposit of grave goods is characteristic; progressive enlargement of these *fossae* was the basis for the development of chamber tombs with *loculi* in the Late Orientalizing and Archaic periods.³⁴⁰⁷

High-quality pottery production testifies to lively communities at Falerii, Narce, and Capena. Capenate brown *impasto* pottery with plant and animal motifs and the Faliscan incised and *ad incavo impasto* ware stand out.³⁴⁰⁸ Black-figure and then red-figure Attic pottery arrived subsequently, reaching Falerii in the second half of the sixth century as the center consolidated its dominant position in the Tiber Valley. At the end of the sixth century, temples at Vignale and Sassi Caduti joined the older suburban sanctuary of Celle that was dedicated to Iuno Curitis, and in the same period a great three-*cella* temple with magnificent terra-cotta decoration was built at Scasato.³⁴⁰⁹

Despite progressive Roman expansion in inland Etruria with the founding of the Latin colonies of Sutri and Nepi around 383, Falerii retained a high commercial and craft profile. In the middle of the fourth century, although allied with Tarquinii against Rome, the city hosted important ceramic workshops that reworked models of Attic red-figure pots. Terra-cotta decorations remained of a high quality in the Early Hellenistic period, as indicated by the Scasato pediment with the well-known bust of Apollo.³⁴¹⁰

Hostilities with Rome resumed in 293 and saw Falerii defeated. In 241 a rebellion led Rome to besiege and destroy the city and move its people to the new site of Falerii Novi, which was built on a plain 5 km away on the Via Amerina. Roman expansion in the Tiber Valley was characterized by the redistribution of land to new owners. The presence of the Via Amerina, and from 220 the Via Flaminia, conferred a certain importance on the area until the second century CE.³⁴¹¹

2Caere

Caere (possibly after the Greek name *Chaire*, which is derived in turn from the Etruscan *Ceisra* or *Cisra*) was also known as Agylla. Myths connect it with Pelasgian founders, but evidence from the Sorbo and Poggio dell'Asino necropolises, along with funerary evidence in the rural east, dates its formation to the Bronze Age (Fig. 70.3).³⁴¹²

The proto-urban form of Caere was characterized by a number of Final Bronze and Early Iron Age settlements connected to necropolises. To the west, the population was grouped around the Monti Ceriti, near the Sasso di Furbara, and around the south slopes of Monte Tosto Alto. To the east, settlement traces can be recognized at Monte Abatone with the necropolises of Migliorie di San Paolo and Monte Abbadoncino. In the Early Iron Age the center was located on the highly populated Vignali plateau (of 160 ha): necropolises with *pozzo* and *fossa* tombs at Sorbo and Cava della Pozzolana evoke the picture of a middle-class community with a rather indistinct distribution of prestigious funerary goods.³⁴¹³

Necropolises provide the main information about Caere. Located on wide tufa uplands beyond the Manganello and Mola streams, beside Vignali, they have been known since 1834 and excavated from 1908 to 1933 by Raniero Mengarelli and then from 1947 to 1976 by Mario Moretti, with exploration of the Banditaccia and other burial areas (e.g. the Via degli Inferi, the area of the Tegola Dipinta, and the Tombe del Comune). The Fondazione Lerici also studied hundreds of tombs between 1956 and 1970 near Banditaccia (e.g. Laghetto I, Laghetto II, and Bufolareccia) and on the Monte Abatone upland (Fig. 70.4).³⁴¹⁴

In the middle of the eighth century, the development of the center appears

to have accelerated with the emergence of an aristocracy that interacted with the East, particularly the Aegean and Anatolia, through Phoenician mediation. Innovations at this time include tumuli, tombs with earthen mounds erected over round bases carved in the tufa rock (the diameters of which are sometimes wider than 60 m, as in the case of the Monte Tosto tumulus), whose sides were decorated with moldings resembling fillets and torus. In Alessandro Naso's opinion, these motifs reached Caere thanks to an artisan of Syrian origin, who knew the monumental solutions used in Anatolian tumuli (Fig. 70.5).³⁴¹⁵

Inside, the mounds held one or more family tombs. Chamber tombs with several interments and imitations of hut roofs (Tomb of the Hut and Tomba 1 del Colonnello) are characteristic of the first phases of the Orientalizing period, or the late eighth century.³⁴¹⁶ The interiors are a local phenomenon, with rooms partially excavated and partially built with blocks (e.g. the Regolini-Galassi Tomb), with successive courses of stonework placed atop one another to create a tapering effect (e.g. Tomb 1 in the San Paolo tumulus). In the Middle Orientalizing period, rectangular rooms became the norm, placed on axis and divided by pairs of pillars, with an imitation central roof with a *columen* and smaller rooms with pitched roofs, essentially reproducing huts in the funerary space (e.g. Tumulo Mengarelli, Tomb of the Ship 1, Tomb of the Painted Animals).³⁴¹⁷

Fig. 70.3: Simplified distribution of archaeological evidence (quoted in the text), on the plateau and in the suburban area of Caere (drawing by the author)

Fig. 70.4: Caere: Distribution and density of tumuli between the Banditaccia and the Tegola Dipinta necropolises, according to the excavated evidence, and compiled by the interpretation of aerial photography (after Bradford 1957)

From the end of the eighth century, and especially in the early seventh, Caere became a protagonist in Mediterranean trade. Its territory lay between the Marangone River, with Castellina as the last outpost of the Monti della Tolfa to the west, and the Arrone River to the east. Its hinterland extended toward the Mignone Valley with settlements on tufa plateaus (Monterano, Pian Conserva and Pian dei Santi, San Giovenale are among the best known). The local material culture, including funerary architecture and pottery, was distinctive to Caere. The commercial interests and influence of the city reached the “*corridoio pulsante di vita*” created by the inland Etruscan centers clustered around the Biedano, including Blera and San Giuliano. Here several features of Caeretan architecture were assimilated and re-elaborated in tumuli and later rock-cut tombs.³⁴¹⁸

Fig. 70.5: Caere: Oblique aerial view of the tumuli located in the area of the Tegola Dipinta necropolis (photograph G. Trogu)

Bucchero workshops were set up at Caere in the first quarter of the seventh century, benefiting from experience gained working brown *impasto* ware. Working alongside Etrusco-Geometric and Sub-Geometric pottery workshops,

they produced vessels for tableware and the symposium. Etrusco-Corinthian pottery and red-slip ware (painted first with “white-on-red” and then with stamped decorations) were produced throughout Caeretan territory. Goldsmiths and bronze workshops specializing in the production of statues and tableware were also active.³⁴¹⁹

The first changes in the social fabric can be discerned in the Late Orientalizing period. The growing strength of a commercial and entrepreneurial class eroded aristocratic power and increased agricultural production, possibly by reorganizing the distribution of arable land to individuals. Between the start of the sixth and the fifth century, Caere promoted long-distance trade, especially with the Celts, of wine transported in red-brown *impasto* amphorae and oil for perfume and ointments carried in Etrusco-Corinthian *aryballoi* and *alabastra*. The inclusion of the Phocaeen colony of Massalia in wine-trading routes was a serious menace for Etruscan, and especially Caeretan, commerce in the mid sixth century. In 540, in Corsican waters near Alalia, the Phocaeans were defeated by the Caeretans, who were allied with the Carthaginians. This confirmed the victors’ control of the eastern coast of Sardinia and Corsica and thus their thalassocracy in the Tyrrhenian Sea.³⁴²⁰

Between the Orientalizing and the Archaic periods, funerary goods included pottery from the major Greek centers (first from Corinth and then from Athens, but also Laconia and the Cyclades). The city became increasingly open to the Mediterranean from the middle of the sixth century, when Caere welcomed Ionian artists from Asia Minor fleeing Persian invasion, including a potter (possibly from Phocaea) who founded the workshop responsible for Caeretan *hydriae*.³⁴²¹

The Archaic period saw profound changes in funerary architecture as tumuli were gradually replaced by hypogean tombs with axial chambers and small rooms opening onto a *dromos*, and a new type of tomb was introduced, the *a dado* tomb, built in tufa *opus quadratum* with an entrance facade. These tombs created a new planimetric organization in the necropolises. Funerary roads and squares (Via dei Vasi Greci, dei Monti della Tolfa, dei Monti Ceriti) in the Banditaccia necropolis are hints of the consolidation of the middle class with limited displays of funerary luxury and the increasing weakening of aristocratic power (Fig. 70.6).³⁴²²

Fig. 70.6: Caere: View of the *a dado* tombs along the Via dei Monti Ceriti, at the Banditaccia necropolis (photograph A. Naso)

Limited information about the Orientalizing and Archaic city was provided by nineteenth-century excavations that uncovered a Roman theater, by the work of Raniero Mengarelli, and by excavations in 1983–89 led by Mauro Cristofani at Vigna Parrocchiale and Sant’Antonio. At Vigna Parrocchiale, a residential quarter with at least one public building, probably a *regia*, was discovered, dating to the sixth century. The area was demolished at the start of the fifth century to make way for a great Tuscanic temple, perhaps dedicated to *Vei*, which remained in use until the beginning of the third century. The temple was contemporary with a large elliptical open-air building with tiered stairs set on thick perimeter walls, which has been identified as a public space for assemblies. The center of Vignali is also remarkable for the notable number of cult buildings brought to light in nineteenth-century excavations at Vigna Marini-Vitalini that yielded large quantities of Archaic and Late Archaic architectural terra-cottas now dispersed in major European and American museums. Other sacred buildings were located near the urban gates, including the Manganello temple to the west, where a votive deposit suggests a male and female fertility cult; and the temple at Vignaccia, connected with a cult for the protection of childbirth and infants. At Sant’Antonio, in an area occupied by Iron Age oval huts and primarily female *fossa* tombs, a complex sacred arrangement arose at the start of the fifth century with the construction of two Tuscanic temples (A and B) oriented to the southwest and on set either side of an altar. The main divinity was *Hercle*, probably accompanied by *Menerva*. The *fons Herculis* recalled in ancient sources may be the complex along the Fosso della Mola to the east of the city.³⁴²³

Between the mid sixth and mid fifth centuries, Caere was a cosmopolitan city. Greek sources mention a Caeretan *thesaurós* at Delphi, and a substantial number of cults were recorded at Pyrgi in a document written in Punic, reflecting Carthaginian presence at the sanctuary for commercial purposes.³⁴²⁴

Excavations at Pyrgi, begun in 1957 by Massimo Pallottino, have brought to light a Greek-style temple (called B) built in ca. 510 with a *pronaos* and one *cella* surrounded by a peristyle, as well as richly decorated revetment plaques for the *columen* and *mutuli* featuring the labors of *Hercle*. The nearby Area C, with an altar and *bothros*, hosted a chthonic cult. Between 470 and 450, Temple A was built, parallel to Temple B, and dedicated to *Thesan/Leucothea*; it had a Tuscan plan with *cella* and *alae*, and a *columen* plaque depicting a scene from the myth of the Seven against Thebes (Fig.51.15). Inscribed gold tablets found in Area C record the dedication of Temple B to *Uni/Astarte* by King Thefarie Velianas in Etruscan and Punic, with strong tyrannical connotations. Research has recently uncovered a crowded southern section of the sanctuary, with several altars and shrines indicating cults of *Śuri/Apollo* and *Cavatha*, gods of the underworld.³⁴²⁵

The complexity of the Archaic and Late Archaic city, ruled by tyrant-kings, is evident in the dense population of the suburbs and countryside. The coast up to the slopes of Monti Ceriti was occupied by open sites connected with necropolises of varying sizes, and by scattered shrines. The picture changes at the start of the second quarter of the fifth century, when Caere lost control of the mid-Tyrrhenian sea after Syracuse's defeat of an Etruscan fleet near Cumae in 474. The resulting decline in the wine trade in the Gulf of Lion affected agricultural and craft production in the city and its territory, and led to depopulation of the hinterland.³⁴²⁶

Caere appears to have recovered from this crisis at the beginning of the fourth century. The political balance had changed, however, with the commercial strength of Carthage and the aggressive presence of Syracuse in the Tyrrhenian Sea; the latter plundered the port and sanctuary of Pyrgi in 384. The growing power of Rome was another important factor. From this time on, the city had a new character; it was controlled by an aristocracy that renovated urban sanctuaries and built large hypogean tombs that were sometimes decorated with stucco and monumental facades (e.g. Tombs of the Reliefs, of the Tarquins, of the Sarcophagi, of the *Tamsnie*, of the Alcove, and of Sant'Angelo). The premise for this recovery was an amicable relationship with Rome: Caere in fact aided Rome in the rescue of the Vestal Virgins and the sacred objects taken from the Capitoline sanctuaries in the Celtic invasion of 390, and was consequently granted *hospitium publicum* and *civitas sine suffragio*.³⁴²⁷ Relationships worsened, however, in the early third century when a rebellion caused Rome to halve Caere's territory, build the Via Aurelia, and establish the maritime colonies of Castrum Novum, Alsium, Fregennae, and Pyrgi on the coast. Caere briefly prospered under Augustus

with a public works program, including the theater, and the prestige of the aristocracy helped it to become a *municipium* with local magistrates. But decline was unstoppable, and by the second century CE public buildings and cult places had fallen into ruin. In the Middle Ages, the few remaining inhabitants moved to Ceri, and the city was revived only in the Late Middle Ages under the name Caere vetere.³⁴²⁸

3Tarquinii

Tarquinii (Etr. *Tarch(u)na*) is considered by the literary sources to be the most ancient city in Southern Etruria. According to tradition, it was founded by Tarchon, the eponymous hero of the Etruscans and the first haruspex. The development of the city has been the subject of a wealth of intensive, high-quality research. From an advanced phase of the Final Bronze Age on, the population was concentrated on the Piano di Civita and the Piano della Regina (150 ha), and in the Early Iron Age also occupied the plateau of Poggio Cretoncini. The necropolises are grouped on the east hills (e.g. Poggio Selciatello, Poggio Sopra Selciatello, Poggio dell'Impiccato, Poggio della Sorgente) but also appear to the north (Poggio Gallinaro) and south of the settlement (Poggio Quarto degli Archi). The number of settlements in the Early Iron Age (at several places on the Monterozzi plateau, where the Arcatelle and Villa Bruschi Falgari necropolises stand out) indicates a complex demography, suggesting a community organized in kinship groups similar to Roman *curiae*. A rich material culture was evidently divided between social classes and featured high-quality ceramic and metalwork from the beginning of the eighth century. In the Late Iron Age, the inhabited area shrank inside the confines of the historical city and Monterozzi became the main necropolis (Fig. 70.7).³⁴²⁹

Fig. 70.7: Simplified distribution of archaeological evidence (quoted in the text), on the plateau and in the suburban area of Tarquinii (drawing by the author)

Excavations at Piano di Civita, directed by Maria Bonghi Jovino since

1982, have brought to light a complex area with a public and religious character. In the Final Bronze Age and Early Iron Age, huts were concentrated around a natural cavity that has been interpreted as a *mundus*. In the Late Iron Age, blood sacrifices were carried out, including the ritual killing of a man (possibly of Greek origin) who was buried with a Euboean *olla*. In the seventh century, the area was monumentalized with buildings and enclosures aligned along a road; of these, Edifice Beta is considered the ceremonial and religious base of the resident *curia* on the Piano di Civita, with a foundation deposit formed of a trumpet *lituus*, a shield, and a bronze axe (Fig. 45.2).³⁴³⁰

The sixth century saw the construction of the city walls in *opus quadratum*. The first *oikos* was built on the Piano della Regina around 570 and was incorporated into a second cult building in 530–520. The sanctuary included a terrace in front of the Archaic building, where a chest made of limestone slabs (interpreted as Tarchon's *heroon*) was placed in the first half of the sixth century and remained *in situ* during subsequent alterations. At the start of the fourth century, the sanctuary gained a great temple with *alae* and a single *cella* behind a deep *pronaos*. Imposing terracotta decorations included pedimental *simae*, antefixes with Silenus and Maenad heads, and revetment plaques with plant motifs; parts of the revetments for the *columen* and *mutuli* have survived, including the well-known hand-molded plaque with winged horses and part of a female figure. The venerated deities may have been Apollo and *Artumes*/Diana, but there are no certain data.³⁴³¹

The relationship between Tarquinii and the Mediterranean is demonstrated by the arrival of the Corinthian merchant Demaratus in the middle of the seventh century. He brought a retinue of artisans to Tarquinii, married an aristocratic woman there, and sired Lucius Tarquinius, the future king of Rome. This story reflects ongoing contact with the Greek world and explains the noteworthy development of artisanal work, including Etrusco-Geometric pottery. The necropolises, located primarily on the Monterozzi plateau, provide confirmation (Fig. 70.8).

Funerary architecture at Tarquinii shows originality from the start of the Orientalizing period, with chamber tombs dug out of the limestone and approached by a wide *dromos* with curving walls and a longitudinal gap at the top that was closed by stone blocks (e.g. Tomb of Bocchoris). Chest tombs, *a cassone*, with a deep trench covered by limestone slabs, are also known and were generally used for single burials. Recent studies have focused on several mid-Orientalizing *tumuli*, where the burial chamber was preceded by an open-air vestibule with steps and benches used for funerary cults. This type of tomb closely resembles the royal tombs of Salamina at Cyprus (of the eighth to seventh century) and shows Tarquinian connections with Near Eastern culture (e.g. Tumuli of Poggio del Forno and Poggio Gallinaro, Tumulo Luzi, Tumuli of Doganaccia).³⁴³²

Fig. 70.8: Tarquinii: Distribution and density of tumuli on the Monterozzi necropolis, according to the excavated evidence, and compiled by the interpretation of aerial photography (after Bradford 1957)

Chamber tombs with benches excavated in limestone became popular between the Late Orientalizing and the Archaic periods. They had a long *dromos*, a small tumulus, and limestone blocks or slabs forming a polygonal masonry platform that was probably used for the deceased's *prothesis*. The entrance to the chamber could be closed with slabs decorated with stepped motifs and representations of animals and myths relating to the underworld.³⁴³³

Contacts with the Greek world were strengthened in the sixth century with the establishment of Gravisca, an emporic sanctuary 6 km from the city. Excavated by Mario Torelli since 1969, the site provides extraordinary proof of the presence of Greek merchants, entrepreneurs, and sailors between the beginning of the sixth century and the first quarter of the fifth century. The first shrine of Aphrodite was built around 580 and replaced by a new building at the end of the century; the impressive number of votive offerings (including Corinthian, Ionian, Laconian, and Attic vases, wine amphorae from Corinth, Chios, Lesbos, Samos, and Massalia, and small bronzes and ivories) and dedications on vases reflect the commercial activities familiar in literary sources (for example, those of Sostratos of Aegina, who dedicated an anchor to Apollo), which were already evinced by other dedications to Aphrodite at the emporion of Naukratis on the Nile Delta. The addition of Hera and Demeter cults caused the construction of a new cult building between 480 and 470 that contained a large shrine and incorporated the cult of Adonis. The political climate, however, made the presence of Greeks increasingly rare, and a reorganization of the site at the end of the fifth century can be explained by

exclusively Etruscan patronage. The cults, which were now those of *Turan*/Aphrodite, *Uni*/Hera, and *Vei*/Demeter, prevailingly had a health-giving and popular character that was reflected in copious anatomical votives.³⁴³⁴

Around 530, some painters who were experts in large-scale painting arrived in Tarquinii after the Persian invasion of Ionian Asia Minor. They transformed local funerary painting, which had been based on the enhancement of architectural details (such as pediments and columns, with polychrome bands between the walls and the lower part of the roof) and the depiction of animals derived from Etruscan ceramics. The city became a laboratory for technical refinements and the development of an expressive, lively, and colorful style for depicting various points in the funerary ritual (the exposure of the dead, athletic games, and races with horses and chariots) that culminated in the banquet and *symposion* honoring the dead with performances by dancers and musicians. Other images, like the hunt, evoked the social identity of the deceased, and there were also scenes with vulgar and erotic content, always accompanied by the consumption of wine, which emphasized the triumph of life over death (Fig. 70.9).

Ionian influence is most visible between 520 and 500 but gave way to styles inspired by Attic ceramics, which can be irregularly perceived until the end of the fifth century. Local painting strictly reproduced elite lifestyles (to date, only three percent of all known tombs are painted) but changed with the approaching crisis of the fifth century, as the number of painted tombs decreased and subjects suggesting that the afterlife was perceived as dangerous and disturbing were introduced. Despite the high quality of paintings in tombs such as the Tomb of the Orcus I, in general quality declined between the end of the fifth and the first half of the fourth century, which prefigured the decay of style and quality known in crafts in the late fourth and third centuries.³⁴³⁵

Fig. 70.9: Tarquinii: Tomb of the Lionesses: performance of the dancers and musicians beside a krater, with banqueters on the lateral walls (about 530) (after H. Leisinger, *Malerei der Etrusker*, Stuttgart 1954)

At this time, however, the urban aristocracy began to recover and consolidate the prestige of *Tarquinii* in Etruria. This change is evident in the tombs, which became grand rooms, frequently adorned with paintings and space for a large number of sarcophagi made from the dense tufa-like volcanic rock known as *nenfro* that were designed to hold members of the most important families (e.g. the Pulena, the Partunu, the Pumpu, the Velcha, the Pinie). City walls were restored and the Ara della Regina temple and terracottas were completely renewed.³⁴³⁶

The period between the last quarter of the fifth and the end of the fourth century is central to Torelli's reconstruction of the fragments of Julio-Claudian inscriptions that were found in 1938 during excavations at the Ara della Regina. These fragments record the *res gestae* of an aristocratic Tarquinian family, the Spurinna, and probably came from the base of an honorary monument with their portraits. The first member, Velthur Spurinna, would have held the title of *praetor* in the Etruscan contingent during the siege of Syracuse in 413–412, as an ally of Athens in the Peloponnesian War (Fig. 38.13). In contrast, his grandson (?) Aulus Spurinna may have been a protagonist in the war between Rome and *Tarquinii* from 358 to 351.³⁴³⁷ This evidence shows strong Tarquinian influence in Etruria, in particular the significant policy of acquiring land by conquest, submission, and alliances in the fourth century, a strategy that repeatedly countered Roman penetration

into inland Etruria. In fact, Tarquinii successfully brought together several inland districts to create a solid frontier against Rome.

Tarquinius influence spread as far as Lake Bolsena and the Tiber region. Here lay flourishing centers, such as Acquarossa, which was excavated by the Swedish Institute of Classical Studies at Rome, providing knowledge of the structural and decorative features of Etruscan architecture in the Late Orientalizing and Archaic periods. Three buildings decorated with antefixes and revetment plaques were arranged around a courtyard to form a monumental area. This complex, probably a *regia*, expresses the autonomy enjoyed by the local leaders of settlements on the periphery of territorial states. The settlement was abandoned at the end of the sixth century and re-founded anew in the fourth at Ferentium. Farther west, Tuscania displays strong adherence to Tarquinian models in its fourth-century tombs, where chambers of wealthy local families held *nenfro* sarcophagi bearing images of the recumbent dead (e.g. Tombs of the Vipinana, the Statlane, and the Curuna). Castel d'Asso and Norchia (Etr. **Urcla?*), in the Biedano Valley, have an extraordinary array of rock-cut tombs, including *tomba a dado* with external porticoes and facades resembling temple frontages. In this phase, *gentilicia* of Tarquinian origin and a prolific workshop of *nenfro* sarcophagi are attested at Norchia. Blera, at the edge of Caeretan expansion in the Archaic period, renewed the terra-cotta figural decoration of some cultual buildings and increased the necropolises for a community to a moderate extent, in which *gentes* of Tarquinian origins are attested. San Giuliano reinforced its *opus quadratum* city walls and supported a workshop making sarcophagi in *peperino*, a volcanic rock similar to *nenfro*, a practice probably inspired by Tarquinii. At its height, Tarquinian territory stretched from the Arrone to Lake Bolsena (*lacus Tarquiniensis* in the sources), to the Monti Cimini in the east, San Giovenale in the south, and the Monti della Tolfa in the west; many of these frontiers had *oppida* and border sanctuaries.³⁴³⁸

Wars were fought several times in the heart of inland Etruria, with the Faliscans and Tarquinii as allies, between the Mignone and Biedano Valleys, on the frontier of Sutri and Nepi (defined as *claustra Etruriae*, the locks of Etruria), and in the Caeretan *ager* up to the salt marshes of the Tiber. The end came in 281 when Rome conquered Tarquinii and dissolved its vast territory. Although the Via Clodia crossed the land, settlements along its route (e.g. Blera, Norchia, and Tuscania) inexorably decayed. The Romans also separated Tarquinii from the coast, where the maritime colony of Gravisca was to be founded in 191. The result was a progressive decline in handicrafts, visible in black-glazed pottery, terra-cotta and *nenfro* sarcophagi, and tomb paintings. The forum was reorganized in the Julio-Claudian period, but Tarquinii experienced gradual decline from the third century CE on and was abandoned five centuries later for the episcopal seat of Corneto.³⁴³⁹

4Vulci

Vulci (Etr. *Velχ*) was located in the low Fiora Valley, 11 km from the Tyrrhenian coast. Historical information about the city is scarce. The Roman *Fasti Triumphales* recall the triumph of the consul Tiberius Coruncanius after his victory over the population of Vulci in 280, and a veiled female personification of the people of Vulci also appears on the well-known marble altar from Julio-Claudian Caere.

The city sat on a plateau of 126 ha and went through the same proto-urban processes as other southern Etruscan centers. Research by Marco Pacciarelli has highlighted consistent settlement on the principal upland, La Città, since the Final Bronze Age, with *pozzo* tombs located near Osteria and at the Ponte Rotto on the left bank of the Fiora River. There are also traces of settlements on the neighboring Pozzatella upland and remains of a necropolis to the south. Complete definition of the center came in the Early Iron Age with widespread occupation on the two plateaus and the establishment of several cemeteries on surrounding hills (to the north, the groups at Osteria; to the west, the areas on the hills in front of Pozzatella; and to the south, at several points in the Tamariceto) extending to the left bank of the Fiora, Cavalupo, Mandrione di Cavalupo, Ponte Rotto, and south of the Cuccumella. It is also interesting to note that other peripheral necropolises, such as Poggio Maremma with tombs dating back to the Final Bronze Age, seem to be connected to the center and anticipate control of the suburban zone by part of the central community through the burial of its members. The votive deposit at Banditella, discovered near a spring 5 km to the east of Vulci in 1992, seems to indicate suburban organization by the Early Iron Age; votives here indicate that the cult site was frequented from the Final Bronze Age to the seventh century, and include two bronze horses and examples of miniature, wheel-made *ollae* (Fig. 70.10).³⁴⁴⁰

Material culture in the Early Iron Age is relatively unknown due to the limited number of excavated *pozzo* tombs but appears to have included high-quality pottery and metalwork. Laminated bronze vessels were abundant; they were used as grave goods between the Late Iron Age and the Orientalizing period. Female grave goods from the late ninth century Tomb of the Sardinian Bronzes in the Cavalupo necropolis show close connections between Etruscan and Sardinian elites, which possibly had been strengthened by marriage. The coast has yielded notable traces of Late Iron Age settlements and cemeteries near Pescia Romana, at the mouth of the Chiarone, the source of the Cesnola Painter's famous Euboean crater. Contact with Euboean sailors, although mediated through the *emporion* at Pitheculasae, is attested around the middle of the eighth century, and artisans of Greek origin, probably transplanted to Vulci, are evident in the abundant production of Etrusco-Geometric pottery with its clear inspiration from Greek ceramics.³⁴⁴¹

Around the middle of the eighth century the city's influence began to

extend to the north, toward settlements in the Fiora valley that were repopulated after Early Iron Age abandonment. Cultural influence was still felt on the western shores of Lake Bolsena and reached as far as Bisenzio. In the second half of the eighth century, the area around the Albegna valley between the Talamone promontory and the south slopes of Mount Amiata became the limit of Vulcian expansion.³⁴⁴²

Most data about Vulci have come from excavations that only became systematic after World War II. Looting and random discoveries from as early as the eighteenth century have produced an incredible number of artifacts (particularly Attic vases) that are now resident in European and American museums. Recent research on the urban plateau, coordinated by Anna Maria Moretti Sgubini, has identified powerful defenses at the western gate in the eighth century. More information about the population, however, comes from Late Iron Age and Early Orientalizing period *fossa* tombs, often covered with tufa slabs, in the large necropolises of Osteria, Cavalupo, Mandrione di Cavalupo, and Polledrara, and to a lesser extent from Poggio Maremma and Marrucatello. Grave goods indicate the growth of an aristocratic class that controlled the arable lands around the city and in the countryside and participated in an exchange network that brought pottery from Corinth and the Greek islands, decorative objects, ivories, ornaments, and fine wines all to Vulci, principally through the Phoenicians.³⁴⁴³

Fig. 70.10: Simplified distribution of archaeological evidence (quoted in the text), on the plateau and in the suburban area of Vulci (drawing by the author)

In the Late Iron Age, Vulci produced a type of fine Etrusco-Geometric

pottery known as *Metopengattung*, characterized by banquet and symposium forms, which circulated in the Fiora and Albegna Valleys from the last quarter of the eighth century alongside brown impasto ware decorated with thin metal sheets in geometric shapes. Large vases in laminated bronze maintained a high standard of production, in the form of biconical vases (often used as cinerary urns), cups, and tripod stands for banquets. The first chamber tombs appeared in the Orientalizing period. Some were simple, such as the Tomb of the Bronze Chariot at Osteria, found intact in 1965 with a rich array of metal vases for two cremation burials, while others were more elaborate, like the Tomb of the Carved Ceilings, a mid-seventh-century tomb with four rooms looking onto a vestibule and a representation of a pitched roof with beam endings that are shaped like disks, that clearly reference contemporary architecture at Caere.³⁴⁴⁴

Tumuli appeared around the city in the last decades of the seventh century, although fewer than elsewhere in the south. The Cuccumella tumulus, with a diameter of approximately 65 m, was surmounted by great *opus quadratum* towers and a rich decorative program of *nenfro* animal sculptures. Inside, two chambers opened onto a large atrium with carved steps along the sides, which was used as a cult space. The nearby Cuccumelletta tumulus had an open-air atrium leading to the burial chambers; new investigations have revealed that sculptures of lions and sphinxes were originally placed on the summit and have confirmed the presence of an adjacent *sacellum*.³⁴⁴⁵

The *cassone* tomb with one underground chamber, generally used for a single burial, and an open anteroom became popular in the Late Orientalizing period. Grave goods in this period included a large number of sumptuous goods such as bronzes, ivories, glass, and pottery from Corinth and eastern Greece. These suggest the rapid growth of an urban community with a class connected to agricultural production as well as artisan and commercial activities. Etrusco-Corinthian ceramic workshops were set up in this phase, including the Painter of the Bearded Sphinx and later the Ciclo dei Rosoni, who may have been stimulated by resident Corinthian potters. Their products were widely distributed across southern Etruria and were also associated with western Mediterranean trade routes for wine. Between the late seventh and the early sixth centuries, wine from Vulci was traded principally with Celtic *emporia* in the Gulf of Lion; the origins of this trade lie in the development and integration of different urban social classes unified by greater access to fertile land suitable for the intensive production of cereals, wine, and olives. The production process in the lower and middle Albegna Valley was systematically researched by field-walking in the 1980s.³⁴⁴⁶

A dense system of open sites was centered on the settlements of Marsiliana d'Albegna and Doganella. Marsiliana d'Albegna was already populated in the Late Iron Age and the Orientalizing period, and grave goods indicate a stratified community (the subject of current research) that occupied a hill system of 47 ha and an intensely populated suburban area in the Archaic and

Late Archaic periods. Doganella appeared at the end of the seventh century as a settlement dedicated to the manufacture of *dolia* and transport amphorae for moving wine and olive oil, and above all the collection of agricultural surplus to take to the seaport in the Talamone lagoon. The high number of transport amphorae made with orange clay fired in the lower Albegna Valley that have been found in the French Midi and at Catalonia reinforce the high volume of the city's production (Fig. 70.11).³⁴⁴⁷

Like Caere, Vulci acquired a leading role in the Mediterranean between the Late Orientalizing and the Archaic periods. It had a diffuse and organized system of ports at sites including Pescia Romana, Orbetello, and on the edges of the Talamone lagoon; the nearest was located at Le Murelle (identified with ancient Regae), where at least two Late Archaic and Classical buildings have been found along with a significant number of local and imported amphorae.³⁴⁴⁸

Less is known about the city in the Archaic and Late Archaic periods. The Pozzatella upland continued to be occupied in the sixth century, and pottery kilns suggest the presence of craft workshops. Several sanctuaries appeared on the La Città plateau, and the Tempio Grande was built around 500 with a single *cella* and peristyle atop a large podium. It was probably dedicated to *Menerva*, and architectural terra-cottas indicate that it was completely renovated in the second half of the fourth century. The extra-urban cult site to the south at Fontanile di Legnisina had a contemporary cult building with three *cellae* for the worship of *Uni/Juno* and a monumental altar dedicated to *Vei/Ceres* with a rich votive deposit of pottery, bronze statues, and anatomical votives. Another sanctuary was sited at the Ponte Rotto. The flourishing of important sanctuaries hints at growing *isonomia* at Vulci, as do modest tombs with one chamber and *buca* tombs that contained vases with cremated remains and only few grave goods. The grave goods document a great development in craft, especially in bronze, stone animal sculptures, jewelry, bucchero, and black-figure ceramics. The Paris Painter and his followers (the so-called Pontic Painters) and the Ivy Leaf Group were active in the second half of the sixth century, and the Micali Painter, working between the last quarter of the sixth and the beginning of the fifth century, led a prolific workshop specializing in vases with funerary subjects.³⁴⁴⁹

Fig. 70.11: Marsiliana d'Albegna: The area of the recently identified settlement (*square-hatching*), surrounded by necropolises (*cross-hatching*) (drawing by the author)

Fig. 70.12: Sovana: The carved facade of the Tomb of the Siren (second century; photograph by the author)

In the mid fifth century, Vulci experienced a crisis. A decline in the wine

trade and importation of Attic vases was accompanied by general depopulation on the plateau and at open sites in the Fiora and Albegna Valleys. Changing social tensions brought the aristocracy to the fore in the mid fourth century, and signs of recovery are evident in the construction of city walls, renovated sanctuary decorations, and the building of great gentilicial tombs. The vitality and pride of local aristocrats (the Tarna, the Tetnie, the Prušna, and the Tute) can be recognized in the Ponte Rotto necropolis, the site of several monumental Late Classical and Hellenistic hypogean tombs with a long *dromos* and burial chambers opening onto a wide atrium, and the exceptional François Tomb from the second half of the fourth century featuring paintings depicting historical events at Vulci glorifying the *gens* Satie and their antipathy toward Rome.³⁴⁵⁰

Fig. 70.13: Sovana: Proposed reconstruction of the facade of the Tomb of the Winged Demons (late third–early second century; drawing by A. Maggiani, courtesy La Nuova Immagine Editrice)

Between the Archaic period and the fourth century, the settlement of Sovana (Etr. **Svea*, Lat. *Suana*), located at the borders of Vulcian territory in the Fiora Valley, developed a unique style of funerary architecture in contrast to other villages in decline (Poggio Buco, Pitigliano, Castro, and to some extent even Saturnia in the Albegna Valley). The new style was characterized by rock-cut tombs with monumental facades imitating the fronts of temples and *aediculae* (e.g. the Hildebrand and Pola Tombs and the Tombs of the

Typhon, of the Siren, and of the Winged Demons) (Figs. 70.12., 70.13).

In 280 Vulci was defeated by Rome and lost the majority of its territory and ports. Rome founded the Forum Aureli near Montalto di Castro, established prefectures at Saturnia and Statonia, and created the maritime colony of Cosa in 273. Although the Via Aurelia opened in 241 and the central plateau continued to host considerable public and private buildings, such as the Late Republican *domus* of the Criptoportico, the city underwent progressive depopulation in the Imperial period and was abandoned in the eighth century CE.³⁴⁵¹

5Volsinii and Bisenzio; Perugia and the Tiber Valley

Volsinii (Etr. *Velzna*) was located at the confluence of the Tiber and the Paglia Rivers on a tufa plateau of about 85 ha that today is completely occupied by Orvieto. Continuing discoveries have identified the settlement's cultural features, which are found in a wide area to the north and east of Lake Bolsena and have also clarified its relationship with Bolsena, where Rome established Volsinii novi after the destruction of the Etruscan city in 264. The proto-urban phase is demonstrated by Final Bronze Age pottery found at several places on the plateau, while Iron Age finds from the city center and plateau slopes (in secondary contexts) suggest widespread occupation. At least three funerary areas (at Crocifisso del Tufo, on the slopes beneath the Pozzo di San Patrizio, and near Surripa) can be connected with Early Iron Age settlements.³⁴⁵² Orientalizing artifacts are scarce and exclusively funerary. The city developed substantially only in the Archaic period, probably through specialization in intensive and extensive agriculture, particularly cereals (Roman sources record that Volsinii supplied wheat to the urban *plebs* after the fall of the Etruscan monarchy), and oversight of goods circulating in the Tiber Valley.³⁴⁵³

The emergence of a middle class associated with agriculture, craft production, and trade is reflected in the organization of necropolises below the urban plateau, such as the Crocifisso del Tufo in the northwest and the Cannicella in the southeast. These were laid out in equal-sized lots and primarily contained *dado* tombs built in *opus quadratum* with bare chambers and grave goods of fairly uniform quality and quantity. Funerary inscriptions concerning *gentes* from areas such as Caere, Veii, Latium, and Celtic lands suggest a recently formed urban community that was open to outsiders. The most significant data come from multiple excavations at the Crocifisso del Tufo necropolis. In the first decades of the sixth century, tombs here had a regular *dado* plan inspired by prototypes from Caere, with a single chamber, a pseudo-vaulted ceiling created by layered steps of stone courses, benches for

the deceased, and an architrave at the entrance inscribed with the names of those interred. Decoration was limited to the upper part of the facade above recurring moldings of a fillet, torus, and hawk's beak. Spherical or pinecone-shaped *cippi* in tufa were usually placed on the summit (Figs. 70.14, 70.15).³⁴⁵⁴

The organization of the city in the Etruscan period is evident today in systems for managing water, such as drains, *cuniculi*, and cisterns, and the remains of several cult buildings. Two decorative cycles (of the first half of the fifth and the first half of the fourth century) are documented at the Belvedere temple, a Tuscanic building dedicated to *Śuri*/Apollo and *Tinia*/Jupiter. On Via San Leonardo, another building with high-quality architectural terracottas can be dated to the end of the fifth century. Several suburban sanctuaries are also attested: a Late Archaic decorative system including a battle with Giants has recently been connected with a building in the Vigna Grande area (dedicated to **Nurti*/Nortia?); and a Late Archaic sanctuary with a funerary element dedicated to *Vei*/Ceres is evident at the Cannicella necropolis. A more peripheral sanctuary with remains of a building and trenches holding architectural terracottas and Late Archaic and Hellenistic pottery has also been linked to the Etruscan federal sanctuary of the Fanum Voltumnae, dedicated to *Voltumna*/Vertumnus, where the *concilia omnis Etruriae* were held.³⁴⁵⁵

In the Archaic and Late Archaic periods, the city directed its interest toward the lower Tiber Valley. Written sources describe the reign of Porsenna at Chiusi and Volsinii, and his attempts in Rome and Latium Vetus to restore the Etruscan monarchy. During this phase, the city underwent considerable development, with mid-quality craft production including bucchero, fine pottery, black-figure vases (the Orvieto Group), and locally produced metal vessels, although stylistically these products depend on prototypes from Vulci. Like the Faliscan and Capenate regions, the Tiber area of Etruria was not affected by the crises of the coastal cities in the fourth century; the strength of the economy is reflected in the repeated supply of grain from Volsinii to Rome during famines, the consistent flow of high-quality Attic pottery that reached the city in the second half of the fifth century, and the considerable trade with Etruscan settlements in the Po Valley.³⁴⁵⁶ Like the coast, Volsinii experienced a remarkable development of the local aristocracy in the Hellenistic period that was connected to local agriculture. *Latifundia* and necropolises far from the urban center flourished from the middle of the fourth century. The Porano necropolis is illustrative: excavated in the Settecimini area in 1863, it includes the two painted tombs Golini I and II: the first contains scenes of preparations for the funerary banquet, while the second shows the journey of the deceased to the afterlife. A third painted tomb located at Castel Rubello depicts the journey of the dead Laris Hescanas to the afterlife.³⁴⁵⁷

Fig. 70.14: Volsinii (Orvieto): Aerial view of the Crocifisso del Tufo necropolis (photograph by P. Nannini)

Between the fourth and early third centuries, Volsinii repeatedly repulsed the advance of Rome until it was finally defeated by the consul Tiberius Coruncanius in 280. In 264 the Romans intervened again when called on by the local aristocracy to suppress an uprising that saw the city taken over by slaves. Volsinii was destroyed and its population was transplanted to a new settlement along the Via Cassia, modern Bolsena, which became an important *municipium* in the Late Republican and Early Imperial periods. Excavations by the École française de Rome have uncovered the forum, the baths, and other public and private buildings.³⁴⁵⁸

Volsinii enjoyed its greatest influence in the Archaic period, when its territory extended from the Paglia and Tiber Valleys to the northern and eastern shores of Lake Bolsena. This region had been populated since the Final Bronze Age, and many settlements show continuity in the Early Iron Age, especially east of the lake, for example at Gran Carro. Volcanic activity produced small tufa uplands overlooking the lake that were occupied by settlements and cemeteries reflecting influence from Volsinii in their use of features like mushroom-shaped funerary *cippi*. Civita di Grotte di Castro and Civita d'Arlena, respectively northwest and east of the lake, have been explored intensively, revealing occupation between the Orientalizing and Archaic periods.³⁴⁵⁹

Fig. 70.15: Volsinii (Orvieto): Three-dimensional reconstruction of the Crocifisso del Tufo necropolis (drawing by Soprintendenza Archeologia dell'Umbria, courtesy Quattroemme)

The area south of the lake is a significant part of inland Etruria. The land to the southwest, between the Marta and Fiora Valleys, was controlled by Bisenzio, a town known since the nineteenth century for its large number of tombs. The Etruscan settlement was set on a hill (now Monte Bisenzio) that was later occupied under Rome by the *municipium* of Visentium. Roman inscriptions record the magistrates and the registration of the Sabatina tribe (as at Vulci), and the worship of Minerva Nortina, who is also linked with Volsinii. The settlement emerged in the Final Bronze Age and greatly developed in the Early Iron Age, with a large number of *pozzo* tombs with original features that set them apart from the proto-urban coastal centers.

Maximum development occurred in the Late Iron Age with the establishment of the main necropolises at San Bernardino, Porto Madonna, Polledrara, Bucacce, Olmo Bello, and Piantata; more recent chamber tombs, perhaps relating to the same settlement, are found on the north shore (e.g. Grotte del Mereo, Poggio Falchetto). A smaller number of grave goods date to the Orientalizing period, and deposits at Olmo Bello continued to the end of the sixth century. The high level of the community is evident in the male funerary ritual, where the deceased, often dressed as a warrior, was interred with a banquet service and symposium set. Women were buried with ornaments and grooming equipment. Influence from Vulci is discernible in the Late Orientalizing and Early Archaic periods, in the spread of Etrusco-Corinthian pottery and bucchero combined with elements of Volsinii's local culture in the second half of the sixth century. This phase also saw a thorough reorganization of the area with the founding of new settlements, such as Poggio Evangelista, perhaps to reinforce the frontier between the lands of Vulci and Volsinii. Bisenzio progressively contracted and eventually disappeared at the beginning of the fifth century.³⁴⁶⁰

The left bank of the Tiber near Lake Trasimeno is also an important area of Etruria, home to Cortona and Chiusi and oriented toward the Val di Chiana and the Amiata region. The eastern side of Lake Trasimeno was an important frontier between the Umbrians, who occupied modern Umbria, Romagna, and Marche (with the towns of Asisium/Assisi, Hispellum/Spello and Mevania/Bevagna), and the Etruscans of Tuder (Todi) and Perugia.³⁴⁶¹

Perugia (Lat. *Perusia*) has two mythical origins: an Umbrian one, in which it was founded by the Sarsinati; and an Etruscan one, in which it was built by Aules, the brother of Ocnus, who founded Felsina and Mantua. Perugia became important at the end of the fourth century when it participated in battles against Rome, culminating in those at *Sentinum* (295) and the *Lacus Vadimonius* (283). During the Second Punic War it supplied Rome with grain and timber; and, following integration into the Tromentina tribe, it became involved in the civil war between Mark Anthony and Octavian. It was destroyed in 40 BCE and rebuilt by Augustus as Augusta Perusia. Continuous occupation of the site since antiquity means that archaeological data are fragmentary. Some grave goods from the Palazzone necropolis date from the Iron Age, but almost nothing survives from the Orientalizing period. A significant number of Late Archaic tombs with Attic pottery and bucchero vases from Volsinii were discovered in the Palazzone necropolis, while important Archaic tombs of peripheral gentilicial groups were found at Castel San Mariano and San Valentino di Marsciano.

Perugia seems to have benefitted from the destruction of Volsinii in 264, experiencing a consistent growth in the urban and rural populations. Imposing travertine city walls with monumental gates (the Arco di Augusto and Porta Marzia) were built in the fourth century. Necropolises were located on the slopes of the upland supporting the city and included *fossa* and chamber

tombs with benches to hold cinerary urns that were made in *pietra fetida* or terra-cotta and had fronts decorated with ornamental motifs or mythical scenes; the lid took the form of a pitched roof or a portrait of the deceased. In the third century, cremation became the exclusive rite, leading to the widespread production of cinerary urns in Perugian territory (from the eastern shore of Lake Trasimeno to Umbertide to the north and Arna/Civitella d'Arno and Bettona on the left bank of the Tiber). Important monuments include the hypogean tomb of the Velimna/Volumni, dating from the late third century BCE to the early first century CE, with a nine-room plan, and tombs at Villa Sperandio and San Manno, the last hosting the tomb of the *gens* Precu. At Montelucente, the tomb of Cai Catu was discovered in 1983. It held fifty travertine urns deposited between the mid third and the first century BCE.³⁴⁶²

Finally, Bettona (Etr. *Vetuna/Vetuni*?, Lat. *Vettona*) should be included among the settlements in Perugia's countryside. The settlement was set 14 km southeast of Perugia on a hill at the confluence of the Chiascio with the Tiber. A perimeter wall of irregular sandstone blocks remains, and a necropolis with sandstone chest tombs was located to the north of the settlement; there are also various remnants of shrines. moderate number of Etruscan inscriptions identify Bettona as a frontier community facing Umbria composed mainly of Etruscan-speaking people.³⁴⁶³

71Northern Etruria

Abstract: Northern Etruria can be defined as the area bounded by the Arno to the north, the foothills of the Apennines to the east together with the upper reaches of the Tiber, and the Albegna River valley to the south. It is an area that includes varied and sometimes rugged topography. The Arno basin features mountainous edges, the sparsely inhabited but economically fundamental Colline Metallifere, the upper Maremma with sites such as Populonia, Vetulonia, and Roselle, which are intimately connected to the coast and the sea, and the major interior sites of Chiusi and Cortona, with the broad and fertile Chiana valley between them. As is the case in the rest of Etruria, the region divides into a coastal zone that includes the centers of Populonia, Vetulonia, Roselle, and even Volterra, set farther back but still connected to the coast. The interior includes Chiusi, the Senese (with the important Orientalizing and Archaic center of Poggio Civitate), Arezzo, and Cortona.

Keywords : Northern Etruria; cities and territory; urban plateau; necropolises; sanctuaries

Introduction

For the purposes of this chapter, Northern Etruria can be defined as the area bounded by the Arno to the north, the foothills of the Apennines to the east together with the upper reaches of the Tiber, and the Albegna River valley to the south. It is an area that includes varied and sometimes rugged topography. The Arno basin features mountainous edges, the sparsely inhabited but economically fundamental Colline Metallifere, the upper Maremma with sites such as Populonia, Vetulonia, and Roselle, which are intimately connected to the coast and the sea, and the major interior sites of Chiusi and Cortona, with the broad and fertile Chiana valley between them. As is the case in the rest of Etruria, the region divides into a coastal zone that includes the centers of Populonia, Vetulonia, Roselle, and even Volterra, set farther back but still connected to the coast. The interior includes Chiusi, the Senese (with the important Orientalizing and Archaic center of Poggio Civitate), Arezzo,³⁴⁶⁴ and Cortona (Figs. 32.1.–32.5).

The sequence of development for northern Etruria appears to be consistent and not altogether different from what is found in southern Etruria. Evidence of Bronze Age occupations is relatively modest and scattered. Iron Age settlements begin to appear toward the end of the tenth century BCE and continue toward the end of the eighth. While not much remains of these early settlements, their existence is evident from their numerous necropolises. Toward the end of the eighth century, there is a visible increase in the wealth

of grave goods and a noticeable influx of imported luxury items and exotica that signals the Orientalizing Period. It is noteworthy that Greek ceramics as well as vessels of Phoenician manufacture and Sardinian bronzes are found together with local products at sites such as Vetulonia. As elsewhere in Etruria, there are changes in mortuary custom and an interest in more monumental forms of funerary display, the grave circle and the tumulus, which are undoubtedly connected to changing social structures. By the early decades of the seventh century, the increase in luxury items, the proliferation of grave goods, and the quantity of exotic imports give a dramatic picture of an explosion of wealth and wider contact beyond Etruria. Centers such as Marsiliana, Vetulonia and Populonia display remarkable wealth no doubt acquired from their fortuitous position near the rich mineral resources of the Colline Metallifere or as ports of entry for traders. The presence of refined *bucchero sottile* of purely Etruscan origin alongside the imported exotica points to an exchange of goods among the Etruscan elites and evidences contact among the cities and southern Etruria, notably Caere.³⁴⁶⁵ More recent studies have shown a similar connection inland with the site of Poggio Civitate,³⁴⁶⁶ which also showed some aspect of exchange with Roselle through shared stamped ceramic motifs. These two sites are directly connected by the Ombrone and Merse Rivers, which ultimately allowed traders ingress from the coast. By the end of the seventh and the early sixth centuries, some centers—for instance Vetulonia—appear to lose their prominence. In contrast, Populonia and Roselle are now in the ascendancy. By the middle of the century, the presence of Greek vessels increases, particularly those of Attic production. Necropolises increase in size and in their proximity to the cities. It has been assumed by some scholars that individual farmers and smaller settlements are moving closer to the cities as the latter develop as economic centers and provide more resources for their inhabitants. At some sites, inhumation increases and almost entirely replaces cremation, a change that has been interpreted as an indication of the rising merchant class and the decline of a small ruling elite. Stephan Steingraber, among others, has concluded that the rise of the cities in Etruria appears to take strong form in the sixth century, coinciding with the rise of this stable middle class.³⁴⁶⁷ The villages in turn grew out of groupings of huts, common in the late Iron and early Orientalizing Period in much of Etruria save for a few sites that appear to have developed a strong urban character ahead of their contemporaries (Veii and Tarquinia).

While the changes in funerary customs described above hold true for much of northern Etruria, the region around Chiusi presents an anomalous situation. The city appears not to have figured prominently in the Orientalizing Period, if one compares the richness of the local grave offerings with that found near the coastal cities, but its presence was felt more strongly in the subsequent Archaic Period and beyond. Despite its relatively small size (ca. 25 ha) and its estimated population of ca. 5,000, it exerted a significant influence on the

surrounding regions with its artistic production. By the Archaic Period, its distinct artistic style is ubiquitous in the north central portion of Etruria, particularly manifested through its production of “bucchero pesante” and stamped decoration produced by roulette. Cremation remained popular and a particular form, the Canopic urn (Fig. 48.3), became associated with the city and its immediate environs.

The predominantly funerary nature of the evidence makes it difficult to define the phenomenon of northern Etruscan urbanization. These cities, with easy access to water or readily defensible—preferably both—are today the same sites occupied by modern cities, hence difficult or impossible to excavate. Only occasionally, at sites like Poggio Civitate or Poggio Colla does the discovery of isolated structures on sites that were left abandoned provide us with us a rare look at architectural remains of freestanding buildings. But any conclusions must be viewed with caution. The bulk of our evidence is mostly funerary in nature, hence very selective. The size, evolution and architectural complexity of a specific urban center are difficult to present to the reader because of the dearth of evidence. Chiusi, Cortona, Vetulonia, Volterra and a host of other North Etruscan cities, lie under the remains of modern construction and are thus impossible to retrieve. Isolated sites such as Poggio Civitate and Castelnuovo Berardenga³⁴⁶⁸ provide architecture of a scale and design which compels us to wonder what relationship they might have had to the surrounding area and how they functioned within that regional, social framework. The problem is exacerbated by the lack of evidence for Etruscan Siena³⁴⁶⁹ and any major urban center in the region between Volterra and Chiusi.³⁴⁷⁰ The common model for understanding Etruscan urbanization is that of the city-state, of city and territory, thus a definition of Etruria along the lines of its political landscape.³⁴⁷¹ The model works along theoretical and macro lines, and in fact reflects what we know from historical sources about the twelve peoples of Etruria, but is less useful in its details. Specific sites—like sanctuaries, and settlements like Poggio Colla—are arguably liminal,³⁴⁷² being more self-sufficient markers of boundaries than political entities imbedded in the greater territory of a large city-state. Indeed, in northern Etruria, the model of centralized power through a single, dominant, centrally located city is not always applicable. Chiusi, for instance, has a widely distributed urban pattern, even if it appears to be a dominant political power in the late Archaic Period, according to Roman sources. And the Agro Fiorentino, with its equally widely distributed pattern of settlement, is a case in point for arguments for very different models of political geography. The same may hold true for early Volterra.

The self-sufficiency manifested by the sequence of structures of the Orientalizing—and by implication, the early Archaic—Periods at Poggio Civitate suggests that other hill-tops were similarly occupied and may have served as home to a local chieftain who enjoyed his own estate complete with workshop, residence and ceremonial or public structures.³⁴⁷³ This leaves one

wondering where the support personnel lived or where others not included in the immediate family were expected to construct their homes. Perhaps one should see, for this region, houses of a type such as the Casa dell'Impluvium (Roselle) as serving the remainder of the community. Similarly, the houses at Lago di Accesa, which are simpler in plan, provide a middle ground in size and construction. However, the disparity in size and decoration with the structures at Lago dell'Accesa reinforces the impression that sites like Poggio Civitate and Castelnuovo Berardenga, as we will see, represent special cases. Suffice it to say the settlement patterns of northern Etruria, perhaps because of the topography, but also because of social and political structures, is complex and not yet fully understood.

1 Vetulonia

The urban nucleus of Vetulonia itself is built on a natural outcrop of rock that has an elevation of ca. 340 m. Its walls enclose an area of ca. 100–120 hectares, making it one of the larger cities in northern Etruria. The extent of the circuit walls corresponds to a rebuilding period sometime in the second half of the fourth century, contemporary with the early minting of coins with the legend *vatl*. However, portions of the circuit wall constructed of large polygonal blocks probably date to the sixth century and are contemporary with sections of the circuit wall at Roselle, which suggests that the region was experiencing troubled times in this period. As with several other large and well-known Etruscan cities, the urban settlement at Vetulonia yielded little material contemporary with the period of major growth of the city. Our knowledge of Vetulonia is thus derived primarily from tombs.³⁴⁷⁴ Many assumptions regarding the importance and size of the city are based on the quantity and opulence of the artifacts found in the tombs and in the monumentality of the tomb constructions. Admittedly, the grave goods do provide a reasonable indication of wealth of some of the elite inhabitants and dramatic evidence of commerce with the world beyond Etruria.³⁴⁷⁵ Both Vetulonia and Populonia, cities separated by ca. 50 km, one directly on the coast and the other slightly inland appear to have enjoyed a healthy existence in the late Villanovan period. Both cities appeared to profit from their vicinity to the Colline Metallifere. At Vetulonia the early Villanovan period is characterized by relatively poor grave goods that increase in wealth by the late Villanovan period (eighth century). Cremations in biconical urns remain the standard form of burial, but unlike most other sites in northern Etruria, Vetulonia manifests the acceptance of hut urns as a container for the ashes, a custom more commonly found in southern Etruria and Latium. In addition, inhumation burials in *fosse* have also been found, datable from the ninth century to the middle of the eighth, providing for an unusual variety of burial

custom.

The necropolis of Poggio alla Guardia is the most significant of the Villanovan necropolises at Vetulonia, and contains a heavy concentration of *tombe a pozzetto*. Most common is the single deposition, though occasionally one finds double or triple depositions with a cinerary urn placed on top of another and separated by a stone slab. There are no external grave markers. The presence of the so-called “Circolo di pietre interrotte” at Poggio alla Guardia, which dates to the late ninth century, is also noteworthy. This custom of placing the burial “wells” within the confines of a ring of stones (which is found elsewhere in Etruria) has been interpreted as a desire on the part of a family or clan to provide a physical demarcation to the burial plot and may even reflect social stratification, a supposition reinforced by the richer grave goods often contained within these circles. Evidence of contact with Sardinia—albeit possibly only through indirect trade—is given in the form of several small Nuragic bronzes found among the grave offerings. Judging from the grave goods, traders from the Baltic, Greece (principally Euboea), and the Levant were also attracted to the area. Mining and metallurgy account for the rich economic base. While iron no doubt was one of the highly prized commodities of the area and sought by traders, its relative impermanence and fragility have left us with few good examples of the skill of the craftsmen or the range of the artifacts produced. Quite common are the remains of iron associated with chariot elements and some weapons. Nevertheless its use as a decorative element in inlays, one example of which can be seen in the buckle from Poggio Civitate,³⁴⁷⁶ suggests it was also a prized material. On the other hand, production in bronze, because of its better preservation, has left us with good indicators of the extent of Vetulonia’s impact on other centers and its geographical reach for this early period. Bronzes of Vetulonian manufacture have been identified at Tarquinia and as far away as Olympia and Samos, in Greece.³⁴⁷⁷

Typical of the Orientalizing period at Vetulonia, as at Marsiliana, are the circle tombs (*tombe a circolo*) with one or more *fosse* contained within. By the middle of the seventh century one sees the emergence of large tumulus burials (*tholoi*) with *dromos* and side chambers accompanied by a wealth of grave offerings. Perhaps best known among these is the Pietrera Tomb, which dates to the second half of the seventh century.³⁴⁷⁸ The tumulus was constructed of a large artificial hill circumscribed by a drum more than 60 m in diameter and 14 m high. In the interior was a chamber tomb with a central pillar. This chamber collapsed in antiquity and was immediately rebuilt with a second chamber placed on top of it. At the time of the excavations, numerous *fosse* filled with rich grave goods were uncovered around the tumulus. Numerous statue fragments of stone figures³⁴⁷⁹ (Fig. 71.1) were recovered in the interior, which represented one of the few sculptural groupings of the Orientalizing period discovered to this point. The recent excavations at Casale Marittimo (discussed below), some 60 km distant, where similar sculptures

have been uncovered, give clear evidence that the fashion extended beyond the confines of this settlement, perhaps providing testimony to the sphere of artistic influence of this city.

Judging by the wealth of the tombs, it would appear that Vetulonia reached its zenith during the seventh century.³⁴⁸⁰ By the sixth century, tombs are smaller in size, less numerous, and less impressive in the quality of the exhibited grave goods. As noted above, this may only reflect a redistribution of the wealth over a larger population and the supplanting of a small group of “elite” families with a rising and financially comfortable “middle class.” In his study of the area, Giovannangelo Camporeale has posed some interesting questions. Does the presence of these Etruscan artifacts manufactured in bronze and recovered at sites beyond Etruria reflect trade only in metal, or does their presence allow us to imagine transport of more fragile and fugitive materials such as cloth or foodstuffs? Is it solely trade or do these objects indicate immigration, perhaps of experts who traveled to other sites bringing with them their expertise as well as objects.³⁴⁸¹ While the argument has been made for Near Eastern artisans reaching the shores of Etruria, settling in coastal cities and plying their trade, it has seldom been suggested that Etruscans emigrated beyond their borders.³⁴⁸² Perhaps we should see this as the logical outcome of an exchange that traveled in two directions.

Fig. 71.1: Vetulonia: Stone relief figure from the Pietrera Tomb (photo SAT)

Like its coastal neighbors, and given its proximity to the Ombrone River, Roselle is well-situated to take advantage of seagoing traders wishing to make their way inland, though apparently not close enough to the sources of metal to take full advantage of mining. This is borne out by the archaeological evidence, for the scarcity of remains for the Late Bronze Age through Iron Age would suggest that the site was eclipsed by its more powerful neighbors—Vetulonia and Populonia in the north, and Marsiliana to the south. Early signs of activity can be seen in the mid-eighth century from traces in the necropolis surrounding Roselle.³⁴⁸³ The picture that emerges is that of Roselle serving as a tributary of Vetulonia, perhaps reflecting the relationship Marsiliana enjoyed with Vulci, as a welcome port of entry leading to sites further inland.

While funerary remains are scarce, evidence of habitation can be found on the north and south hill in the form of huts that date to the second half of the eighth century. What emerges is a picture of a settlement formed of irregularly placed huts, with ample open space dedicated to fields for pasturing and cultivation, similar to models that are well attested in the south. During the middle of the Orientalizing period, there is a dramatic change in architectural form, with the construction of the so-called “Casa con Recinto,” a formal two-room enclosure composed of crude brick, located in the forum between the two hills. More recently it has been proposed that it served as both a public and sacred center for the community. The absence of tiles suggests a roof of straw or thatch. Mario Cygielman sees here two functional yet distinct areas: an open courtyard on the east, perhaps for more public encounters, and a closed space on the western flank where ceramic evidence suggests the presence of symposia or formal gatherings.³⁴⁸⁴ Cygielman further sees the features of a tholos in this structure, thus documenting a relationship between tomb type and habitation. In this way, he sees the monumental tombs of the period as reflecting with some accuracy various architectural elements of residences.³⁴⁸⁵ The building itself is of considerable size (26 m × 7.5 m), not unlike OC1 at Poggio Civitate, which is roughly contemporary but fitted with a more elaborately decorated roof. One of the fragments found within the “Casa con Recinto” is the rim of a *dolio* with an inscription translated by Mauro Cristofani³⁴⁸⁶ as indicating a gift from one person to another. Is this an example of a precious offering exchanged between two members of the elite class at Roselle, or an indicator of interaction further afield? Cristofani has assigned an elaborate gold fibula displaying designs in the *pulviscolo* technique (associated with Vetulonia and particularly common to the Tomba del Littore) to this period.³⁴⁸⁷ All the elements of the architecture taken together, with the presence of a *focolare*, have resulted in various interpretations for the function of the building, from a Regia of the type known from the Roman forum to a public/sacral building (similar to the Roman cult of Vesta) connected to an ancient royal residence. A more recent interpretation by Gilda Bartoloni and Piera Bocci Pacini suggests that the

structure functioned as a gathering place for the local community, combining all the functions of a public and sacred space. Comparable to the Greek *Basileus*, it was the home of the local chief where the community would gather on special occasions.³⁴⁸⁸ This is also one of the possible solutions offered by the excavators at Poggio Civitate for the buildings of the Orientalizing Complex as well as the subsequent Archaic Building on the site.³⁴⁸⁹ Yet the elaborate nature of the decoration at Poggio Civitate and the number of buildings in the Orientalizing Complex compared to the single structure at Roselle makes one wonder about the relative importance of these local “princes.” If the elite at Roselle gained his power from the fortuitous location of the site, what was the source of power at Poggio Civitate? At the end of the seventh century at Roselle, one sees new buildings on the north hill and the construction of the “Casa a Due Vani,” which cuts into one of the wings of the “Casa con Recinto,” perhaps replacing the function of the latter. This continuity has also been postulated at Poggio Civitate between the structures of the Orientalizing Complex and its Archaic successor.³⁴⁹⁰

The existence of circuit walls for this early period at Roselle is still under discussion. The excavations have uncovered traces of walls, though some have suggested that they served as part of a terracing system rather than serving to defend or define the city. As the area of habitation expanded, the need for cultivatable land increased and necessitated the use of terracing to take maximum advantage of the limited space. By the sixth century, Roselle appears to break away from the dominance of its neighbor Vetulonia, and begins to establish itself in the area. By the middle of the century, reflecting the unrest visible in much of Etruria, the city has constructed a circuit wall enclosing the north and south hills. The wall, about 3,170 m long, encloses an area of about 45 hectares. It was built over an extended period of time and was repaired during the Roman era. Constructed in polygonal masonry of local stone, the northern sector rises up from trenches dug in the bedrock. The southern sector of the wall is built in squared blocks, and appears to date to the second century during a period of later rebuilding. Steingraber puts its population at ca. 12,000, less than half of that postulated for Populonia and yet more than twice the size of Chiusi, at 5,000 inhabitants.³⁴⁹¹

Between the 1980s and 1990s, excavations on the north slope of the north hill, some five meters from the summit, brought to light the existence of a remarkable building. From the results of these careful excavations, the archaeologists concluded that the typology of the Italic house centered around an atrium with *impluvium*, as hypothesized for Marzabotto, was already in use in Etruria by the sixth century. Equally interesting is evidence that suggests a continuity of habitation and architectural development in the immediate area progressing from the late Villanovan Period through to the early decades of the fifth century. Three successive occupation phases have been identified. Remains from a refuse pit suggest that houses in the early period were constructed using reed impressed plaster. The excavator, Luigi Donati, feels

that the absence of tiles indicates the presence of a straw or thatch roof such as that suggested for the contemporary “Casa con Recinto” uncovered in the forum between the two hills. The second phase of occupation is represented by the remains of House C, a freestanding two-room unit. Though somewhat difficult to pinpoint chronologically, Donati suggests a date between the Villanovan construction associated with cavità A and the House of the Impluvium, i.e. between the end of the seventh century and the first half of the sixth.³⁴⁹²

3Populonia

Populonia (Etruscan *Pupluna*) is exceptional in that it is the only Etruscan city directly on the sea (Fig. 71.2), the last city to join the Etruscan league, and a site whose very foundation and later political identity was often connected by ancient authors to non-Etruscan areas like Corsica and Syracuse.³⁴⁹³ Populonia was also a center of intense mineral exploitation and metal production, and metal production areas have been excavated at both Populonia and nearby Campiglia Marittima. The residues of this production—literal mountains of slag—eventually blanketed the cemeteries on the Golfo di Baratti (see chapter 26 Corretti). By the fifth and fourth centuries, Populonia lays claim to an industrialized production that will eventually result in a monetary economy, as evidenced by the extensive production of silver coinage in the Hellenistic period. In his studies on the urbanization of Etruscan settlements, Stephan Steingraber concludes that at its height, Populonia was certainly one of the larger cities in Etruria after Veii, Caere and Tarquinia, covering ca. 150 hectares.³⁴⁹⁴ The urban center was girdled with a wall more than two kilometers long, which was interrupted by defensive towers during this period. Also noteworthy is the development of settlements on the coast in the third and second centuries when Volterra was extending its power. With respect to populations, Steingraber estimates Populonia to have had ca. 25,000 inhabitants, similar to Caere, while Vetulonia was somewhat smaller, with 17,000.

Fig. 71.2: View of the Golfo di Baratti from Populonia (photo P. G. Warden)

Populonia seems to be one of the few Etruscan cities where the Iron Age culture is placed directly on top of the late Bronze Age, as evidenced in the region of the Villa del Barone, where a Protovillanovan necropolis was uncovered. A horde of bronzes found in the locality of Poggio Guardiola belongs to the same period. The first imports to reach the city seem to come from Sardegna. However, many of the foreign imports point to the presence of Greek merchants, especially those from east Greek colonies. Analysis of the grave goods from the surrounding cemeteries suggests that in the second half of the eighth century (late Villanovan period), Populonia experienced a recession, perhaps due to the ascendancy of Vetulonia. It is conjectured that the city reached its fully formed state between the end of the seventh and the beginning of the sixth century, but architectural remains of this period are scarce at best. Nancy Winter, in her recent study on the development of architectural decoration in Etruria, does not list a single terracotta from the city prior to 500 BCE.³⁴⁹⁵ In marked contrast to this lacuna, the material from the tombs shows an extraordinary concentration of wealth.³⁴⁹⁶ Exploitation and production of iron increases in the second half of the sixth century, and in the middle of the fifth, Populonia flourishes and appears to be untouched by the “crisis” that hits the cities of southern Etruria, as evidenced by the refined Greek (Attic) objects recovered from the tombs. Both Elba and the eastern coast of Corsica—especially Aleria—depended on Populonia from the fifth century when the city seems to grow in power. Its mining- and metallurgy-based wealth can be seen in the mountains of slag produced from the fifth

century onward, which covered the tumuli of the earlier necropolises and which were so rich in metal that they were re-smelted in modern times.³⁴⁹⁷ The city reached its height in the early Hellenistic period; the population seems to spread inland and develops agriculture to enhance an economy that had been reliant on mineral exploitation.

The Orientalizing and Archaic tombs of Populonia³⁴⁹⁸ share some basic similarities with those of the neighboring settlements at Vetulonia in that both sites incorporate burial within the confines of a circular structure. However, whether it is a result of the restrictions of the terrain (located so close to the beaches) or local preference, the tumuli in general are smaller than those encountered elsewhere. Recent work at Populonia has focused on the city itself, especially the dominant and prominent acropolis, which seems to have been repeatedly terraced in antiquity. The presence of fragments of decorative terracottas, along with massive foundations, indicates that at least one important temple would have been found in this area.³⁴⁹⁹

4Volterra and Environs

As elsewhere in Etruria, the population at the end of the Bronze Age in the northwestern corner of Tuscany is characterized by numerous sporadic settlements along the coastline from the Gulf of Baratti to the mouth of the Arno. Among these is the site of Volterra (Etruscan *Velathri*), located slightly further inland, and accessible from the coast by the Cecina River.³⁵⁰⁰ It is the largest concentrated settlement in the area, and appears to have been continuously occupied from as early as the ninth century. With its seven kilometers of circuit walls, Volterra was the seat of an active production center. In the earlier periods, objects of Volterranean manufacture can be found as far south as Monteriggioni, and by the Hellenistic period, Volterranean pottery is widely traded. An important sanctuary, probably dedicated to a female divinity of chthonic character, has been excavated on the acropolis.³⁵⁰¹ Ritual and devotional activity can be documented there from the seventh to the second centuries.³⁵⁰² This may be due to Volterra's convenient position roughly one day's journey inland from the coast, along the Cecina River. Thus it was strategically placed for control of the trade routes from the coast to the inland areas of the upper Arno, the Senese, and other routes that carried across the Apennines to the north and northeast. It is interesting to note and perhaps significant that like Volterra with its proximity to the Cecina, many important northern sites are strategically placed close to rivers. Artimino overlooks the Arno, Marsiliana is close to the Albegna, and Poggio Civitate and Roselle are in close proximity to the Ombrone, all rivers that create natural routes from the coast to the interior.

Fig. 71.3: The late Etruscan city gate at Volterra (photo P. G. Warden)

In the ninth century, there is evidence of a settlement in the vicinity of the topmost plateau (Pian di Castello). In close proximity is the cemetery of Ripaie, with its cremation burials. The city continues to grow and by the eighth century occupies the entire plateau. The burial customs now include both cremation and inhumation in fossa tombs, as is common elsewhere in the region. Toward the end of the Villanovan and the beginning of the Orientalizing periods, Volterra seems to have reached the geographical extent of its expansion, noticeable by the density of burials especially in the

necropolis of Guerruccia, and by the appearance of small extra urban settlements. In the Cecina River valley, settlements of this period have been identified at Pomerance, Sassa, Casale Marittimo, and Montescudaio with necropolises nearby.³⁵⁰³ Some settlements enjoyed a longer *floruit*, while others such as Montescudaio were relatively short-lived. The number and density of necropolises dating from the fourth to the first centuries indicate the area was heavily populated and dispersed. The economic base would appear to be agrarian. The number, size, and construction of the tombs may indicate a broader and flatter profile to the social landscape. Massive walls and a well-preserved gate (Fig. 71.3) of later date have been preserved.

New evidence has emerged recently of an Etruscan presence north of Volterra at minor centers like Legoli³⁵⁰⁴ and Peccioli. These centers are in the region between Volterra and Pisa, but probably lay within the territory or political orbit of the former. Excavations at Peccioli have produced an unusually large pit that was filled with a great variety of fragmented remains from nearby structures (including tiles and plaster from buildings) as well as prestige items like bronzes and some exceptionally fine Attic red figure pottery.³⁵⁰⁵ The excavators convincingly suggest that the material may be the detritus of a sanctuary, and thus perhaps ritually buried; the site has been labeled as the Sanctuary of Ortaglia.³⁵⁰⁶ Further work in the area northwest of Volterra will certainly fill in the lacunae of our knowledge of the areas around Livorno and Pisa.³⁵⁰⁷

5The settlement at Casalvecchio (Casale Marittimo)

Among the noteworthy settlements in the Cecina River valley is that at Casalvecchio. The architectural evidence suggests the emergence of a new social pattern developing during the Orientalizing period, perhaps formalizing the authority of a local chieftain. Furthermore, fragments of pottery recovered from the area shed some interesting light on the exchange of gifts among the elite of this and the adjacent regions. The settlement occupied the summit of a small hill.³⁵⁰⁸ Excavations have revealed the existence of a collection of huts, which appear to have been destroyed toward the end of the eighth century. In the course of the Orientalizing and Archaic periods, the settlement occupied the area of the plateau immediately below the acropolis. However, it was in the fully developed Orientalizing period that a building (Beta) of relatively imposing size and construction was erected on the site. The dramatic architectural departure from its predecessors, together with the numerous fragments of refined bucchero associated with the building have led scholars to conclude that the structure enjoyed an importance perhaps as a political or ceremonial center for the area. Suggestions that it may have served as the

“reggia” of the settlement echo similar hypotheses presented for the contemporary “Casa con Recinto” at Roselle and the larger more complex arrangement at Poggio Civitate. The excavations have revealed that toward the end of the seventh century, a new and larger structure (Building Gamma—at no less than 4.5m × 15m) was erected over the earlier foundations with an elongated plan consisting of clay walls reinforced with reeds and strengthened with poles. The structure was decorated with Gorgon-headed antefixes and painted plaques, and was probably destroyed by fire and apparently rebuilt without coroplastic decoration. It was finally destroyed and abandoned in the early decades of the sixth century. Excavations carried out in the 1960s indicate the existence of an intricate system of buildings belonging to the Hellenistic period.

Among the ceramic evidence recovered from the vicinity of buildings Beta and Gamma are a number of cup fragments with incised and impressed decoration of a type found at Monteriggioni, the Tomba del Duce at Vetulonia, Caere, and more recently Poggio Civitate. They provide a clear trail of gift exchange among elite families from these centers, though one wonders at the circumstances that brought them to these locations.

6Necropolis at Casa Nocera

The nearby necropolis at Casa Nocera consists of a series of tombs situated on a small mound rising from the plain.³⁵⁰⁹ The tombs chronologically range from the end of the eighth to the beginning of the sixth century, with the majority clustered around the middle of the seventh. There are inhumation burials of varying types. While Tomb C is not the earliest, it is certainly the largest and most elaborately built, and dates to the second quarter of the seventh century. As they have been robbed, few remains are preserved from any of these tombs. However, two imposing limestone statues were recovered in the vicinity, and it is thought that they belonged to the earliest phase of Tomb C.³⁵¹⁰ They are striking in their similarity to those recovered from the Tomba della Pietrera at Vetulonia, and attest to the range of influence of that city in this period. Together with the “bucchero sottile” from Building Beta, they provide a more nuanced picture of the interrelationship of elite families during the Orientalizing period.

While the grave deposits for this region are few, due to their removal over time, the recent discoveries in the area confirm the impression, given by earlier documentation that Volterra and its environs benefitted from their fortuitous location. The elaborately woven gold chain displaying techniques of filigree and granulation, together with the elegant gold fibulae attributed to the Tomba di Gesseri³⁵¹¹ indicate that certain elite families in the area were the recipients of opulent gifts like those of their coastal neighbors. They also

corroborate an exchange among elite families between this region and Vetulonia, and Caere, a conclusion drawn from the presence of similar “bucchero sottile” recovered from burials in these areas.

7Poggio Civitate (Murlo)

Traveling from Roselle, up the Ombrone, one reaches the hilltop site of Poggio Civitate some fifty-five kilometers inland. In some ways, despite its remarkable state of preservation, the site raises more questions than it answers. It presents us with some striking anomalies when considering Etruscan architectural development. While the site has produced one monumental building and several subsidiary structures that date to the sixth century, and three smaller yet equally impressive earlier structures representative of occupation on the hill during the Orientalizing period (Figs. 71.4.–71.5), the architectural picture is at best incomplete. One cannot say with certainty that a village existed on the top of the hill, but it is tempting to imagine that an area so large, which could easily have supported a small community, was home to a community greater than the inhabitants of the currently excavated structures. In the early 1970s, the discovery of nine fossa tombs on the adjacent Poggio Aguzzo, datable to the early to mid-seventh century,³⁵¹² provides a richer context for the architectural picture.

To date, the most notable and frequently discussed architectural units from the site are located on Piano del Tesoro, near the top of the hill.³⁵¹³ One large building, 60m× 90m, datable to the Archaic Period (Fig. 71.6), dominates the plateau. Its footprint occupies approximately seventy-five percent of the available building space on the plateau. The structure is composed of a series of rooms on four equal sides and is built around a colonnaded courtyard open to the sky. A projecting room at the northeast corner and another at the southwest corner connected by the extension of the western wall 30 m to the south, have been interpreted as watchtowers. Construction began some time shortly after 600. Ceramic evidence in the form of Greek pottery suggests the building was destroyed toward the last quarter of the sixth century, at which time the site was apparently abandoned. Though the nature of the destruction was thorough, and many of the various decorative elements appear to have been deliberately broken and buried in pits and hollows scattered throughout the plateau, the archaeologists were left with a relatively uncontaminated context. This has resulted in the preservation of a large portion of the structure’s decorative terracotta elements, including ridge tiles, pan and cover tiles, antefixes, simas and decorative frieze plaques. Noteworthy are the large statues of human figures, considered by many to represent ancestors, and the real and mythological creatures, which adorned the ridge of the roof, as protectors and symbols of power and authority.³⁵¹⁴

Adjacent to the building are two smaller structures. One lies immediately to the north of the northern wall and is situated on the very northern edge of the plateau. Its placement would suggest that the builders were either aware of the impending construction of the larger building or were already constrained by its existence. Ceramic evidence indicates that it was constructed after the destruction of the Orientalizing phase of occupation on the site. A second, equally small building lies to the south of the southern flank. Fragments of imported Greek pottery place the floruit of this structure toward the last quarter of the sixth century. It is the latest building to have been standing on the plateau. How this large structure and the adjacent buildings to the north and south functioned and who destroyed them remain up for discussion. It would be prudent to reserve judgment regarding the function of the building and the importance of the site in the region until further exploration on the hill has been carried out. Piano del Tesoro, while ideally situated on the hill, takes up less than a quarter of the available area, but the monumental building is not located on the highest point on the hill. Architecturally, Poggio Civitate documents the continuity of architectural development on one site, allowing us to see how architectural systems of decoration developed. This is particularly noticeable in the evolution of the lateral sima, the frieze plaques and even the acroterial decoration.³⁵¹⁵

Fig. 71.4: Poggio Civitate. Reconstruction of the Orientalizing period complex, view from the south (courtesy Murlo archive)

Lying below the foundations of the western flank of the Archaic Building is an earlier structure (OC1), which for its period would be considered substantial (5.8m × 35m) (Figs. 71.4.–71.5). From the materials recovered from the floor of the building, it would appear to have functioned as a

residence for a wealthy Etruscan of the period.³⁵¹⁶ Architecturally, the building's roof is crowned with ridgepole decoration in the form of flat geometric cutouts, vegetal patterns as well as animal and human motifs, a predecessor to the figures in the round which decorated the later structure built over it. While other decoration directly associated with the building from the find contexts is lacking, it can be inferred from those elements retrieved from a building situated to the southwest (OC2), less than 100 meters away and lying at the southernmost edge of Piano del Tesoro. This freestanding shed-like structure is devoid of walls and clearly served as a workshop for the mass production of large scale terracottas, artifacts of varying size in bronze and carved objects in bone, antler and ivory.³⁵¹⁷ It is assumed that ceramic production took place in the near vicinity, if not directly in the building, though no kiln has been found to date, nor is there evidence of intense heat around the workshop. It has been assumed that kilns are probably located along the south slope of the hill. This would allow them to catch the natural updraft and be near enough to the building for convenience of transporting clay artifacts in the fragile "greenware" state, but not next to it as a precaution against fire. Evidence of large containers of grain and carbonized seeds indicate that storage of comestibles was yet another function of the building. It should be noted that grain was also found stored in large vessels embedded in the floor of OC1. Remarkably, for so utilitarian a building, the roof was elaborately decorated with geometric cutouts of the type associated with OC1. In addition, a fully functioning lateral sima with applied female heads and hand-modeled lion spouts, in an earlier stage of development than that found on the archaic structure, decorated the lower terminus of the roof. The recovery of an unfired frieze plaque from the floor of the workshop, devoid of relief decoration and probably painted with scenes in its final stage also points to the evolution of that decorative form on the site. Its successor, which adorned the Archaic building, is almost identical in all dimensions, and was decorated with scenes in low relief accentuated by paint.

Fig. 71.6: Poggio Civitate. Reconstruction of the archaic period structure, view from the southeast (courtesy A. Tuck)

Between the workshop and the residence, the excavators have uncovered a third structure (OC3), a tripartite building with large foundation walls.³⁵¹⁸ The relatively large thickness of the walls suggests that the builders were inexperienced with supporting a heavy tile roof, and thus overcompensated by constructing thicker walls than necessary. This in turn suggests a first attempt at tile roofed construction on the site soon to be followed by other buildings with more appropriate walls as confidence and experience in the system grew. The excavators see in this building one of the early examples of a transition in construction from a thatched roof to a tiled one. More recent excavation in the

area, in an attempt to provide greater clarity, has brought to light fragments of *bucchero sottile* vessels lying on the floor and within the building.³⁵¹⁹ They are of a style associated with cups manufactured at Caere and perhaps Populonia. These cups, with their distinctive decorative patterns, incised, impressed and in relief have been identified as indicators of gift exchange among the elite. Similar vessels have been found at Caere, Vetulonia, Populonia, Monteriggioni, and Casale Marittimo, to name a few sites. These vessels were recovered from the floor of the building, and so it is tempting to see evidence of the building's usage as a religious or ceremonial structure and of a type suggested for the "Casa con Recinto" at Roselle and Building Beta/Gamma at Casale Marittimo. The formal arrangement of the rooms in OC3, with two wings flanking a central "cella" of twice the length, reinforces the impression of a building dedicated to ritual use.

All three buildings of the Orientalizing period at Poggio Civitate are tied together chronologically by stratigraphy and appear to have been destroyed by a single conflagration some time at the end of the seventh century. In this complex of three buildings, it is tempting to see the functional predecessor to the Archaic structure that dominated the site in the early sixth century. The elements of a residence, atelier and ceremonial/public center may be inferred in the later structure in three of the four wings that comprise the Upper Building together with what may have been an altar, located in the central courtyard adjacent to the western flank. The construction date for these buildings is still a matter of discussion.

The decoration of the Archaic building, and that associated with its predecessor has most recently been placed in a chronological sequence of architectural decoration found in Italy by Nancy Winter.³⁵²⁰ In her exhaustive study, the author dates the decorative elements of the Archaic building to ca. 580–575, with the possibility of some later replacements manufactured ca. 550–525. Those from the Orientalizing structure are placed between 640 and 630 in the sequential development of Italic terracottas; Winter observes that they constitute some of the earliest and most elaborate examples of Etruscan roof decorations. It is hard to imagine, however, that the elaborately decorated buildings of the OC were first attempts; they too must find their origins in earlier systems. Yet for the moment, the Orientalizing Complex at Poggio Civitate provides us with the earliest elaborately developed system yet uncovered in the region and its successor, the Archaic Building, is the earliest monumental structure to make its appearance in the Archaic period in northern Etruria. Paradoxically, no large tumuli have been identified to date that compare to those at other well-known sites for which equally elaborate architecture has yet to be uncovered. What are we to conclude? Why is the Archaic Complex sitting on the top of Poggio Civitate and what was its function? Where is the settlement associated with it?

Establishing a coherent chronology for the site is problematic. The building complex has no contemporary tombs, and conversely, the Poggio Aguzzo

tombs appear to be slightly earlier than the building dates normally assigned to the structures on Poggio Civitate.³⁵²¹ One may conclude that we have yet to find these earlier structures on the hill, given its considerable size, or we may have to reconsider the chronology currently assigned to the material from Poggio Civitate and Poggio Aguzzo. Is it possible to push back the chronology of the Orientalizing period buildings to more closely fit the tomb material or should we push down the dates of the tomb material to conform more closely with Winter's chronological sequence? How does Poggio Civitate aid in our constructing an accurate picture of an Etruscan settlement? If tombs are to be any indications, should we expect to see houses of monumentality, congruent with tombs of the period? If the simple "fossa tombs" of Poggio Aguzzo are associated with the inhabitants of Piano del Tesoro in the late Orientalizing period, where are their houses? Is the inhabitant of the monumental Archaic complex on Piano del Tesoro interred with his family on Poggio Aguzzo? Is there a monumental tumulus in the vicinity yet to be discovered? If the fossa tombs relate to the monumental complex and its predecessors, what can we expect architecturally in residences at Vetulonia and Populonia? To some degree, the answer may be provided in the OC complex on Piano del Tesoro. The material lying on the floor of OC1 has strong parallels with material found in the Montagnola tumulus at Sesto Fiorentino. The gold work, ivory/antler and the ceramics show a chronological relationship. Hence we may associate this tomb type with this residence, and by extension with the "cousins" of the Sesto tomb who were interred in the monumental tumuli of Populonia and Vetulonia. What remains a puzzle is the dearth of architectural terracottas at these and other important period sites. If structures as simple in function as the workshop on Piano del Tesoro can enjoy elaborate decoration, why have so few pieces come to light at sites other than Poggio Civitate and Acquarossa? It cannot be due to the fragility of the material or their reuse in another fashion. If the elaborate decoration of these buildings is an attempt by their owners to display social status and to serve as a statement of their lineage, then it might be reasonable to assume that these elements of distinction would be destroyed by succeeding generations in an attempt to restate the new social order. In any event, their presence on these buildings reinforces the interpretation that the site of Poggio Civitate enjoyed a position of considerable importance in the region during its *floruit*.

8The Colline Metallifere, Massa Marittima and the Lago dell'Accesa

The Colline Metallifere provided the Etruscans with vast natural resources that were fundamental to the wealth of Populonia, and Vetulonia, the major

Etruscan urban centers in the region, but also the other centers farther north and south, which must have directly profited from the trade in metals. Lago dell'Accesa³⁵²² provides an interesting contrast architecturally to Poggio Civitate. The site, predominantly dedicated to supporting the mining activity in the area, undoubtedly housed individuals connected to the mineral exploitation. While the houses are modest in comparison to the size and decoration of the main Archaic structure at Poggio Civitate, several of the buildings exceed the dimensions of the peripheral structures at that site. These have been identified by the excavators as homes of the "upper middle class," a supposition presumably based on their relative size, the number of rooms and the array of material found within. In several cases, the excavator alludes to scoops as ritual objects and conjectures that ceremonial and religious activities were carried out.

The buildings are randomly placed with no visible symmetry or order. There is no central space around which the houses are oriented. The alignment of some of the structures and the close proximity in which they are placed suggest they were standing in different periods. No reference is made to architectural terracottas, and it is assumed that the houses were simply roofed with pan and cover tiles but devoid of decoration. Several of the buildings are relatively large, although there are few comparisons from other sites in northern Etruria. Buildings here range between twenty and thirty meters in length, with irregular interior divisions creating five to seven rooms. The irregularity may be due in part to different construction periods or later remodeling. The larger buildings do approximate the size of OC1 at Poggio Civitate, absent the architectural decoration.

If we are to assume these are the homes of "upper middle class managers," as has been suggested, can we expect to find similar structures at Poggio Civitate? In the North and South Buildings, can one see structures designed to house managers responsible for overseeing the activity on the hill? Or do we have a different social order? Is it possible that further excavation on the hill will produce a habitation area not unlike what has been uncovered at Lago dell'Accesa? The proximity of tombs to the houses at Lago dell'Accesa is also interesting, though the two constructions may not be contemporary. A similar situation may have existed at Poggio Civitate, where small tombs, plundered at an earlier date, were found near an artisan area some 200 meters to the west of the Archaic buildings on Piano del Tesoro. Thus, Lago dell'Accesa provides us with a site that is contemporary with the Archaic complex at Poggio Civitate, but considerably different in layout, size and monumentality. Again it reinforces the importance within the community of the complex on Poggio Civitate, if size and decoration are considered as significant indicators. The modesty of the construction at Lago dell'Accesa is in high contrast to the elaborate construction and architectural embellishment lavished on the Archaic Building at Poggio Civitate.

9Chiusi, Sarteano and Environs

If one compares the richness of Chiusi's grave offerings with those found near the coastal cities, Chiusi evidently did not figure predominantly in the Orientalizing Period, but made its appearance felt more strongly in the Archaic Period and later. Chiusi exerted a significant influence on the surrounding regions with its artistic production. By the Archaic Period, its distinct artistic style is ubiquitous in the north central portion of Etruria, particularly manifested through its production of "bucchero pesante" and stamped decoration produced by roulette. Cremation remained popular and a particular form, the Canopic urn, became associated with the city and its immediate environs.

Chiusi has received significant attention by archaeologists and historians, perhaps because Livy mentions one of its kings—Porsenna—in the history of early Rome. Little if anything has been recovered of the Etruscan city itself, and much of our knowledge is gleaned from the numerous necropolises that spread out in various directions from Chiusi and Sarteano: Poggio Renzo, Fornace, Fonte all'Aia and Solaia, Sferracavalli respectively. Despite its size, Chiusi's artisans appear to have wielded considerable influence, and their distinct style can be found throughout Etruria in the Archaic and succeeding period, especially in bucchero production in relief and stamped ware (cylinder seals). While *bucchero pesante* from Chiusi is ubiquitous and evidence of the city's commercial health in the Archaic and Classical period, few examples of *bucchero sottile* of the Orientalizing period has been recovered to date.

It has been noted that Chiusi did not enjoy the benefits of being on the coast or located in a mineral-rich area like many of her neighbors. However, the seventh-century Plikasnas situla provides evidence of contact with the eastern world at a time contemporary with the appearance of similar objects on the coast and to the south. The vessel has been described by Marina Cristofani Martelli as possibly the product of an immigrant worker for a local client in Caere, and it displays aspects of style common to the Levant. The Pania pyxis, an elegant container elaborately carved from an elephant tusk, shows the growing influence of Greek narrative in the decorative scheme. Stylistically, the work reflects the influence of Vulci and has been dated from associated grave finds to the last quarter of the seventh and the early sixth century, providing further testimony to the interaction among elite families between the Agro Chiusino and the coast during the late Orientalizing period.

During the Iron Age, the inhabitants of Chiusi and its neighboring areas appeared to enjoy a level of equality. Burials manifest little differentiation in size or wealth of grave goods. At Sarteano, documentation of the ninth century Villanovan period is scarce. There are, however, numerous examples of tombs from the eighth century and the transitional period between the Villanovan and the Early Orientalizing. The necropolis of Sferracavalli, which was excavated by Bargagli, stands out in importance for the number of tombs

—150—of which twelve were *a ziro* of the Orientalizing Period and the rest were *a pozzetto*. Although the number of tombs increases dramatically during the Villanovan period and the scattering of necropolises suggests a diffusion of settlements in the area, the ceramic evidence recovered remains relatively poor and is probably an accurate indicator of the relative prosperity of the region when compared to its coastal neighbors.

In the course of the seventh century, the full Orientalizing Period, the territory of Sarteano, and the entire Agro Chiusino, as manifested by the emergence of necropolises and their grave deposits, begins to show a period of awakening. Growth and prosperity continues through the late Orientalizing and through the Archaic periods, as evidenced by the emergence of chamber tombs containing “Canopics” on thrones (Fig. 48.3). As with the “*circoli di pietre*” characteristic of the emerging coastal settlements, this distinctive burial type has been cited as an indication of social demarcation illustrating the emergence of family burials under a *pater gentilis* and breaking away from the earlier more equitable distribution seen in Villanovan necropolises. Such a distinction would appear to have developed somewhat later in this region than on the coast. Totally lacking at Sarteano are the throne or bronze ossuaries documented in the necropolises of Chiusi and in the latest discoveries at Chianciano, which are symptomatic of an aristocratic wealth that began to manifest itself in burials with all the symbols and attributes of power tied to control and the agricultural richness of the area. The fact that the area’s economic base was centered on agriculture, resulting in a different social landscape, may explain why the city of Chiusi itself remained geographically limited and why settlement was dispersed in a manner that is characteristic of northern Etruria. The elite clans in the region lived outside the city, controlling large tracts of land and employing workers that lived in smaller settlements.

In the sixth century, one sees the presence of settlements in the area of Solaia and Mulin Canale, but there was a gradual movement—which became stronger in the succeeding century—toward the Astrone River and the areas under the central hegemony of Chiusi. In the area of Pianacce, a few monumental tombs were excavated by Guglielmo Maetzke in the 1950s that contain material from the Archaic through Hellenistic periods and indicate the presence of aristocratic families that used the burial sites for successive generations. The richness of the grave deposits and the source of much of their inspiration illustrate the wealth of those interred and speak to the general impact of Chiusi on the region. In the late 1990s, the discovery of chamber tombs in a fifth-century necropolis in the area of Palazzina, with deposits of Attic red figure and Etruscan black figure give further testimony to the wealth of the local elite and to the prosperity of the region.³⁵²⁵ The grave goods and tomb typologies provide close parallels with those coexisting in the necropolis of La Pedata at Chianciano and to a somewhat lesser degree those in the necropolis of urban Chiusi. The discovery of the remarkable Tomba della

Quadriga Infernale³⁵²⁶ in the Pianacce Necropolis with the well preserved remains of elaborately painted walls dramatically illustrates the level of sophistication reached by the elites of Sarteano. It also presents a radically different iconography of the afterlife in the eponymous scene of a red-haired figure (a demon?) riding a chariot drawn by two lions and two griffins. A banquet scene is somewhat more conventional, but a monumental coil of snakes once again places it in an otherworldly context. While the iconography is extraordinary, the manner of decoration connects Sarteano to other sites with monumental tomb painting, including Chiusi, Orvieto, and even Tarquinia. Further excavation in the Pianacce necropolis is bringing to light more chamber tombs and even a “theatrical” area for the performance of funerary rites. Clearly Chiusi and environs were home to well-connected wealthy and sophisticated families.

During the Hellenistic period, Sarteano experiences continued growth as one finds elsewhere in the Agro Chiusino. There are new settlements and a reflowering in the area of Mulin Canale and Solaia, documented by various tombs of differing typologies. In the Hellenistic period, we find a settlement associated with the necropolis in the area of Le Tombe, from which came most of the Collezione Bargagli, now in the archaeological museum in Siena. Further evidence of continued growth in the area can be seen from the statue fragments of a pediment now displayed in the Chiusi Archaeological Museum, which are said to belong to a sanctuary in the vicinity of Astrona.

The only settlement discovered in the area of Sarteano, and presumably dating to the third–second centuries, is that documented in an unpublished note by Guglielmo Maetzke, based on trenches dug in 1957 in the area of Aiola to the south of the center of Sarteano on the road to Radicofani. Excavations uncovered a foundation of travertine blocks, numerous tiles and black glazed pottery.³⁵²⁷ The social organization associated with this settlement model is the same explained by Cristofani for the entire agro Chiusino, one of small agricultural farmers in a familial relationship that produced grapes and is corroborated by the discovery of a tomb at Mulin Canale with thirty-nine niches cut into the dromos beside the contemporary monumental burial chamber. This societal arrangement apparently coexisted with elite families whose burials were comprised of more imposing funeral chambers.

10Arezzo, Cortona, and the Val di Chiana

As it is today, the area between and around the important cities of Arezzo and Cortona must have been extremely fertile in antiquity, and the agricultural wealth would have enriched the nearby cities. In fact, the plains around Arezzo (*Etrusci campi*) are mentioned by Livy as particularly prosperous and

a prime target for Hannibal during the second Punic War (Livy 22.3.3–6). The land around Arezzo was notably fertile in Roman times, and the city is strategically placed with connections that must have facilitated trade both within Etruria and with non-Etruscan areas across the Apennines.³⁵²⁸ Arezzo contributed large quantities of arms and grain to the Roman cause and the expedition against Hannibal in Africa in 205 (Livy 28.45.16–17). Although Arezzo was certainly an important city by the fifth century, little is known of its early history, and its foundation is possibly later than other cities in the northern interior. The earliest necropolis, Poggio del Sole, southeast of the city, dates to the sixth and fifth centuries.³⁵²⁹ Not much is known about the city in this period, but the presence of important Greek imports—for instance the remarkable Attic red figure krater by Euphronios, now in the Arezzo Museum—attest to lively trade with the Greek world. Arezzo figures prominently in Roman sources, especially for the later Hellenistic Period.³⁵³⁰ It remains an important center into the Roman period, particularly noteworthy for its ceramic production. The city itself is now covered by later remains, but it doubtless included the area between the Duomo and the high parts of the hill. Despite the lack of archaeological evidence, what remains documents a variety of religious areas: a votive deposit near S. Lorentino that included the famous Chimaera, more votive deposits connected to a cult area at Fonte Veneziana, architectural terracottas from a temple near S. Iacopo, and sanctuaries in the broader region, ranging from Castelsecco (third century) to Pieve Socana where a well preserved altar of the fifth century has been discovered. Farther to the north, Arezzo must have had connections to important cult centers such as the sanctuary at Monte Falterona, at a small pond that marked the headwaters of the Arno in the Apennines. Here massive amount of bronzes of every type were dedicated, from the well-known statues that now grace major museums in New York, Paris, London, and St. Petersburg, to masses of small weapons, implements, and *aes rude*.

The area between Arezzo and Cortona was once defined by the *Clanis* River and includes what must have been small hilltop towns of no mean importance, like Castiglion Fiorentino, where recent work, especially in the area of Torre Cassero,³⁵³¹ has produced evidence for a flourishing settlement from at least the sixth century onward. Not far from Castiglion Fiorentino, one of the most exceptional deposits of bronzes was excavated in 1863.³⁵³² The Brolio deposit included four large figurines—three male and one female—that clearly served as supports, possibly for a basin or as the base for a piece of furniture (Fig. 71.7a–b). A plausible hypothetical reconstruction would have the three male warriors moving (or dancing?) around the centrally placed female (a goddess?). Smaller animal figures might have decorated other parts of this object. The Brolio deposit is often referred to as votive, a term that is used generically for any sort of deposit, thus part of a sanctuary setting, but the exact nature of this early and unusual deposit remains in question.

Fig. 71.7: Two bronze figurines from the Brollo deposit: a. male; b. female (photo SAT)

Fig. 71.8: Cortona, tumulus Sodo II: plan (courtesy SAT)

The city of Cortona is located in a dominant and defensible position that backs up against high hills and faces west towards the Val di Chiana and Lago Trasimeno.³⁵³³ The general layout of the city can still be discerned today even if the urban fabric of later periods covers the Etruscan city. Massive Etruscan walls still girdle the lower part of the city, and the high acropolis is now covered by a Medici fortress. Tombs and a possible hut serve as slight evidence of Villanovan occupation, but the city clearly comes to prominence in the Orientalizing period when large tumuli are built far below the city on the plain in the vicinity of modern Camucia.³⁵³⁴ These tumuli are in proximity to Orientalizing grave circles from even earlier, from the middle of the

seventh century. Small soundings in the city proper have turned up good quantities of seventh-century bucchero, but the preponderance of evidence once again comes from the rich cemeteries. Particularly notable are the Melone del Sodo I and II, enormous tumuli that signify the rising power of the ruling elites (Fig. 71.8). The recent discovery of a monumental stone funerary altar connected to the Sodo II tumulus, which has been known since the nineteenth century, along with evidence of other structures, provides evidence for the rituals and symbolism associated with funerary cults. The altar (Fig. 71.9) has a typical Etruscan stone podium and a steep staircase that leads to the platform. The *antae* of the staircase are decorated with scenes of mortal combat between a warrior and a lion.³⁵³⁵ In each case, a massive seated feline has within its grasp a male warrior, who is driving a sword into the side of the predator, a remarkable image of two beings becoming one while at the same time killing each other. The scale of the Cortona altar, apart from the sculptural decoration, is indicative of ancestor veneration that suggests heroization if not actual deification of ancestors.³⁵³⁶ Cortona remains an important city through the Hellenistic period. The impressive walls were added in the sixth or fifth century, and there is abundant evidence from Cortona, Camucia, and even nearby Ossaia of cult places or sanctuaries, much of which is revealed by the find spots of the abundant bronzes that grace the Cortona Museum. Two finds are exceptional. One is the famous bronze lamp found in a field in the vicinity of Cortona, which is one of the most massive and elaborate of Etruscan bronzes and a testament to the quality of metal production in the Val di Chiana. The other is the Tabula Cortonensis, which is of interest, apart from the inscription that seems to relate to real estate transactions, in the way it was purposely cut into pieces, perhaps as part of a ritual (Fig. 38.2). The splendid metal production from this area becomes even more remarkable when we factor in the Brolio deposit, the Chimaera of Arezzo, the Arringatore, and even the recently restored Minerva, now considered an original work of the Hellenistic period.

11Fiesole and the Agro Fiorentino

The area around Florence, what Francesco Nicosia called the Agro Fiorentino,³⁵³⁷ presents a case study of demography and urban development that is characteristic of northern Etruria. This includes a loose agglomeration of various types of settlements—from hilltop towns surrounded by necropolises (such as Artimino), to orthogonally planned cities in the manner of Marzabotto to the north, and the recently discovered site of Gonfienti. The major city in the area, according to later sources, was Fiesole (Lat. *Fiesulae*), a site that came to prominence only after the classical period, at least judging from the scant evidence of earlier material that has come to light to date—primarily scant fragmentary ceramics of the Villanovan and Orientalizing periods. Settlement must have been concentrated on the two highest points, San Francesco and Sant’Apollinare, and it is only in the later Archaic period that the site demonstrates better evidence of significant material culture, including late Archaic terracottas, a fragment of which has been identified as

an altar,³⁵³⁸ and a votive deposit in the former Villa Marchi. Certainly by the fourth century, Fiesole was the dominant site, judging by the preserved remains of fortification walls, a temple embedded in the fabric of later Roman construction, and historical sources that attest to the site's importance. The picture that emerges, however, is that before the fourth century Fiesole is no more significant than any of the other sites in the area, including Sesto and its imposing Orientalizing tombs (Montagnola and La Mula), and even the plain of Florence itself, where Villanovan burials have been found at both Peretola and in the center of the modern city.³⁵³⁹ Far more impressive than Fiesole are the Orientalizing tombs at Comeana and Montefortini, as well as the remains of the settlement, unfortunately much disturbed by later building, in the area of the Villa Medicea at Artimino.³⁵⁴⁰ Recent work has also produced what may very well be a sanctuary on the dominant acropolis of Pietramarina.³⁵⁴¹ Artimino and Comeana, with their rich tomb groups of the Orientalizing Period, document the wealth of early elites at strategically placed settlements scattered around the Florence basin.³⁵⁴² That the area continued to be prosperous is clear from the new discoveries at Gonfienti, a site in the plain of what is now the area between Prato and Florence (Fig. 71.10).

Fig. 71.12: Kilns in the Podere Funghi, production areas associated with the sanctuary of Poggio Colla (photo Mugello Valley Archaeological Project)

Gonfienti was rationally laid out on a grid, and the orientation of the city is said to mirror that found across the Apennines at Marzabotto. Whether this is

by trans-Appennine design or the result of standardized religious precepts in the laying out and ordering of cities is a fascinating question. The excavators at Gonfienti have carefully excavated an elite residence that takes up an entire block, rather different in this sense from the houses at Marzabotto that constitute parts of *insulae*. The house is of the peristyle type, arranged around a porticoed courtyard that opens onto a large dining area in the back. The portico was decorated with figural antefixes, and the ceramics found crushed in the dining area include Attic red figure vases of astonishing quality.³⁵⁴³

The scattered settlement pattern in the Agro Fiorentino can also be found in the neighboring areas of Mugello and Val di Sieve, the liminal areas northeast of Florence that provided access to Bologna and Etruria Padana. That there was a cultural continuum in the Arno valley and its tributaries (Agro Fiorentino, Val di Sieve, Mugello, and even farther downstream from Artimino) is clear from the find spots of the “pietre Fiesolane,” a series of funerary stelae and cippi (Fig. 71.11) that provide a virtual guide to the demography of these areas in the sixth and fifth centuries.³⁵⁴⁴ Although almost every one of these funerary reliefs had been removed from its original position in an Etruscan cemetery, their general find spots document the many small and scattered settlements that must only have coalesced into a larger polity, presumably dominated by Fiesole, after the fifth century. In the Mugello and Val di Sieve, important settlements existed at Londa, Frascole (Dicomano), and San Piero a Sieve. The latter, judging from a now-destroyed Orientalizing tumulus on the valley floor, has the earliest documentable Etruscan presence, but recent work at the settlement and sanctuary of Poggio Colla (Vicchio) is producing rich Orientalizing-period evidence, and more that is possibly even earlier.

The acropolis sanctuary of Poggio Colla prospered from at least the seventh century until its destruction, probably at the hands of the Romans in the second century.³⁵⁴⁵ The settlement included production areas, as in Cetamura (Fig. 71.12),³⁵⁴⁶ that must certainly have been connected to the economic agency of the sanctuary itself, which was strategically placed in a dominant position at the juncture of two discrete areas, the broad Mugello basin and the narrowing defiles of the Val di Sieve, which afford access to the Arno and the Agro Fiorentino. The sanctuary, which in recent years has produced abundant information about ritual activity,³⁵⁴⁷ had at least four phases of occupation. The earliest, identified by traces of hut foundations, may be associated with two heavily carbonized strata that predate the first stone architecture and are filled with bucchero and bucceroid impasto that date to at least as early as the middle of the seventh century. Subsequent to this early horizon, there are at least three building phases that have been discussed in detail elsewhere.³⁵⁴⁸ In Phase I, possibly in the late sixth or fifth century, a monumental temple was built on the acropolis. The temple was destroyed and replaced by two subsequent courtyard complexes. The first of these (Phase II) measures approximately 11 by 20 m and had a large central altar as well as change in

axis. Phase III continued the courtyard plan, with only minor changes in layout but with rubble rather than ashlar foundations. What is interesting about the transition from Phase I to II, from podium temple to courtyard structure, is that the temple parts were ritually treated, and that these ritual actions are mirrored in the many votive or ritual deposits at the site.³⁵⁴⁹

12Pisa and Liguria

Etruscan Pisa was relatively unknown until the excavations and research of Stefano Bruni revealed an Etruscan presence as early as the Orientalizing period. Bruni carefully excavated a tumulus with a large stone altar placed at its summit.³⁵⁵⁰ The altar seems to have been used and ritually broken, and traces of a sacrificial knife, four iron spits, an iron trident (again, ritually broken), and the jaw of a horse were found *in situ*. Because the main chamber of the tumulus did not contain a body, Bruni surmised that the tomb belonged to an Etruscan noble, a *princeps gentis*, who had been lost at sea. Most interesting is the fact that the upper part of the tumulus was used as a cemetery from around 700 to the fifth century, as a place for smaller tombs for succeeding generations of descendants of the noble ancestor. Here the altar has become the centerpiece of an elaborate genealogical setting that connects the living with the dead and that endows privileged status through connection with a hero-ancestor, possibly one whose status has been ritually established through the sacrifice of a horse and the destruction of the altar. The tumulus is surrounded by cippi and stelai, some of which are inscribed with the names of family members, creating a tableaux vivant of elite genealogy.

The area around Lucca and the north has recently received more attention and has become more archaeologically visible thanks to the research of Giulio Ciampoltrini. An Etruscan presence is clear at Garfagnana³⁵⁵¹ and at the edges of Liguria,³⁵⁵² but the boundary between Etruria must have been mutable, and relationships between these two peoples would certainly have changed over the course of the first millennium. As with much of northern Etruria, there is much to be learned, no more so than in the liminal mountainous areas that separated the Etruscans from their neighbors.

72 Settlement Patterns and Land Use

Abstract: The term “landscape” means the outcome of the changes wrought by man on the environment in the course of extracting resources useful for survival. Defining the Etruscan landscape is the result of recent studies, which on the one hand have analyzed and classified the features of rural sites and on the other have reconstructed specific characteristics of the environment in pre-Roman antiquity. Research on the landscape is based above all on field walking, which, through targeted surveys that explore specific regions in Etruria in an integrated way, has revealed a significant body of information on open sites since the first British studies in and around the city of Veii. These open sites—which are typically small (usually less than 1 ha of scattered surface finds of domestic ceramics and building materials), are located near arable land, and are completely lacking defenses—have long been interpreted as the fundamental Etruscan productive unit on the basis of their agricultural production (particularly the cultivation of grapes and olives, integrated with cereals) and livestock. This chapter presents the historical evolution of the rural settlement system. In the Late Iron Age, the growth of the city and the reoccupation of settlements on smaller plateaus by some of the aristocracy produced a stable form of ownership in the countryside, with large estates owned by Etruscan *aristoi* who used members of the lower classes or slaves for agricultural labor. Between the late seventh and the early sixth century BCE, however, a profound change in Etruscan society can be observed, which coincides with the rise of open sites. These sites highlight direct contact with arable land on the part of the resident population of the countryside: the presence of small, mid-level necropolises connected with open sites assumes a stable form of land ownership declared by the burial. Archaeological data indicate the emergence of a middle class in the Archaic period that was capable of producing a significant agricultural surplus to be transported on commercial routes through the western Mediterranean and particularly directed toward the Celts between the sixth and the mid fifth centuries. The chapter thus offers a synthesis of the principal problems involved with analysis of the Etruscan landscape and presents a synoptic view of the development of the rural population in southern Etruria from the Orientalizing period to the Roman conquest, which occurred between the early fourth and early third centuries.

Keywords: Rural landscape; open sites; agricultural production; land control; commerce

1 Definition of the Etruscan landscape and methods of study

If “landscape” is understood to mean the outcome of the changes wrought by man on the environment in the course of extracting resources useful for survival, then defining the Etruscan landscape is the result of many recent studies. Only in the last few years, in fact, has research into the Etruscan countryside (understood as the area around a settlement), with the critical

contribution of field walking, reached a suitable level of complexity. On the one hand, attention is concentrated on the distinctive features of rural sites, which are marked by limited, scattered finds of ceramics and building materials; on the other, a multidisciplinary approach between Etruscology and the natural sciences is increasing knowledge of the domestication of the grape and the olive in an effort to identify continuities between the ancient and the modern countryside. In its geomorphology and soil, as well as its climate and rainfall, Etruria is an ideal region for the practice of Mediterranean polyculture, which comprises the integrated cultivation of grapes, olives, and mixed cereals, side by side with livestock.³⁵⁵³

Fig. 72.1: Distribution of archaeological sites identified during the Ager Faliscus survey (1966–71), under the direction of Timothy W. Potter. The circle around Narce marks the extent of a hypothetical territory of 5 km radius. (I) Bronze Age; (II) ca. tenth–eighth centuries; (III) ca. seventh–sixth centuries; (IV) ca. fifth–fourth centuries (after Potter 1976; courtesy The British School at Rome)

Fig. 72.2: Distribution of open sites (end of the seventh–sixth century) in the eastern countryside of Caere: (*crosshatching*) the plateau of Caere and the port of Alsium; (*black circles*) small open sites; (*open circles*) large open sites; (*black triangles*) rural necropolises; (*dotted areas*) extensive necropolises; (*asterisks*) cult places; (*crosses*) generic finds (drawing by F. Enei; courtesy of F. Enei)

Research on the landscape and agricultural use of the soil owes much to British archaeology, in particular to the methodology developed for the South Etruria Project, which was established by John Ward Perkins at the beginning of the 1950s. Here the exceptional visibility resulting from agrarian reform around the city of Veii allowed surveys that resulted in an immense quantity of data, with the development of the first typological and chronological parameters for the classification of open sites in Etruria (Figs. 72.1., 72.2).³⁵⁵⁴

One difficulty to be addressed is the predominantly historical perspective of the topographical analyses conducted by Italian scholars, who were unaccustomed to considering the complex stratification of the landscape or to approaches recognizing long periods of environmental development. The history of agricultural production and several outlines of the Etruscan food supply system have used literary and iconographical sources, underestimating the contribution of the soil, climatic, and agronomic analyses that can clarify the nature and suitability of soils for cultivation. Archaeological data have also been employed in discussions of the use of food in ritual contexts (e.g.,

the composition of funerary goods), or trade in agricultural products (e.g., the distribution of amphorae), but the considerable body of information on the handling and cooking of foodstuffs conveyed by domestic ceramics has been practically ignored.³⁵⁵⁵

Full recognition of the different types of settlements, as implied by the structure of the rural fabric, is still hindered by the paucity of knowledge of the topography of Etruscan cities, the complex nature of which has sometimes been highlighted by the identification of a suburban zone occupied by necropolises and cult places as well as minor centers and farms, distinct from the zone deeper into the countryside. These features have been the focus of research on the formation and composition of territory controlled by the city and on the close relationship that existed between the city and countryside. This relationship is evident in the remarkable size of the agricultural surplus of cities such as Caere and Vulci, which was destined for trade and transported in *impasto* amphorae (which primarily held wine and oil or olives, the principal products of Etruscan agriculture) that have been found between the Ligurian Sea and the Gulf of Lion, as far as the coast of Catalonia.³⁵⁵⁶

2The city as central place and the rise of aristocratic estates (*latifundia*)

An appropriate term for the political and economic relationship between city and countryside in Etruria has recently been devised: the “territorial state.” Structured in a hierarchical way across a network of settlements that identifies the vast area of influence of the city, it differs according to its relative position in the complex mosaic of Etruria proper, between the Arno and the Tiber, and is now also recognizable in the settlement patterns of the Po Valley and Etruscan Campania.³⁵⁵⁷

At least in central and southern Etruria, the concept of the territorial state offers distinct possibilities for focusing on the phenomenon of the city from the proto-urban phase to the extensive topographical and social organization of the historical period. As the southern area is better studied in terms of settlement dynamics, the region can be taken as a paradigm for the relationship between city and countryside in Tyrrhenian Italy. Here the city emerges in the late Final Bronze Age and the Early Iron Age, on uplands extending 100–150 ha or more, in a process that led to the abandonment of minor Final Bronze Age settlements (which were generally located on small plateaus or hillsides, with an average size of around 5 ha), and the relocation and concentration of Proto-Villanovan communities on larger plateaus.³⁵⁵⁸

In the Late Iron Age, from around the middle of the eighth century BCE, the southern cities redefined their relationship with the countryside through the systematic reoccupation of minor settlements between 5 and 10 ha in size,

many of which had already been frequented in the Final Bronze Age. These sites reproduce the topographic model of the city on a small scale. They are bordered by deep ravines, crossed by waterways that shaped the sides of the plateaus, and have necropolises distributed on uplands surrounding the settlement. Interestingly, the necropolises of smaller centers reflect an aggregation of family groups and yield important signs of the stratified nature of Etruscan society. At the top is found a class that expressed a level of prosperity approaching the urban aristocracies, through tomb architecture and a wealth of funerary goods.³⁵⁵⁹

It is therefore likely that, at least in the initial phase, the reoccupation of the Etruscan countryside in southern Etruria had dynamics similar to those of the coastal cities. A dominant class controlled the countryside with *latifundia* (vast family-held estates) placed within a few hours' walk from an upland settlement that were farmed by drawing on the labor of the lower classes and slaves and were inherited by descendants. As Marco Rendeli has observed, the city already exercised an important role in the organization of the countryside in the Orientalizing period, employing the geographical model of a central place with articulated peripheral branches.³⁵⁶⁰

Due to its complexity, however, aristocratic control of the countryside defies generalization, and similar evidence can suggest different forms of occupation and control of the land. For example, in the Orientalizing period, in the corridor between the Val d'Orcia and the Ombrone Valley, forms of dynastic ownership of the countryside are found that imply a desire for autonomy from Chiusi. This is expressed by monumental buildings, as in the case of Poggio Civitate (Siena), where a grand residence with an adjoining workshop was built in the mid seventh century, rebuilt at the beginning of the sixth, and finally destroyed during the second half of that century.³⁵⁶¹

3Etruscan open sites and agricultural production in the Archaic period

Although it is a recent contribution, the identification of open sites has emphasized the complexity of the settlement system in Etruria and other parts of pre-Roman Italy. Typical characteristics are: (a) a size of less than 1 ha, usually between 0.25 and 0.5 ha; (b) the presence of domestic *impasto* ceramics for preserving and cooking foodstuffs, and fine ceramic tableware in bucchero and depurated pottery; (c) the presence of building materials (usually blocks in *opus quadratum*, cover tiles, and pantiles); (d) a short distance between open sites, often less than 1 km; (e) location in an area with high agricultural potential; (f) a location lacking natural or artificial defenses; (g) connection with roads and paths of communication; and (h) connection with necropolises of limited size (Figs. 72.3., 72.4).³⁵⁶²

Increasing knowledge of maritime commerce has clarified the Etruscan system of production and its evolution over time. What appears certain is the noteworthy availability of a surplus of not only agricultural but also artisanal products that poured into markets in the western Mediterranean between the beginning of the sixth and the middle of the fifth centuries. This surplus is the result of both a well-structured system of production that was supported by slave labor and, most likely, a form of fragmentation of the land that allowed free individuals to farm large sections of the Etruscan countryside, probably under the direction and control of a city.³⁵⁶³

Fig. 72.3: Rendering of an Etruscan open site identified in the countryside of Caere: (*triangles*) fragments of small grindstones; (*crosses*) tiles; (*open circles*) limestone flakes; (*filled circles*) red tufa flakes; (*dashed line*) the hypothetical perimeter of the building (drawing by F. Enei; courtesy F. Enei)

Fig. 72.4: An Etruscan open site at Poggio Lascone (Tolfa), in the territory of Caere: view of the surviving artificial terraces, designed to limit erosion of the hillside, located along the side of the site (photograph by the author)

At the height of the Archaic period, the result of these transformations can be seen in the assertion of a middle class that was responsible for a peak in artisanal production due to a remarkable specialization in workshops corresponding with a perceptible rise in agricultural production. Signs of the widespread cultivation of the countryside in southern Etruria, in addition to open sites, are substructures on hillsides with terracing walls for protection from hydrological instability; extensive systems of tunnels dug into the tufa for the drainage of surface water; and roads cut deeply into tufa banks that connect the bases and summits of cultivated plateaus. It took enormous organized and collective labor to execute these works, which is unthinkable on the part of individual farmers; hence the current debate on forms of temporary control of the land or, alternatively, stable ownership secured through individual holdings awarded by the city.³⁵⁶⁴

Another topic for discussion is the relationship between rural sites and burial places. On the one hand, the distribution and topography of necropolises, along with funerary architecture and burial goods, have facilitated recognition of the social status of the deceased. On the other hand, the presence of burials directly connected with these sites has suggested forms of long-lasting ownership of arable land that was granted to those who carried out burials in contexts outside urban necropolises and those of settlements on smaller uplands.³⁵⁶⁵

With archaeological survey one can only sense the workings of the rural population. Detailed knowledge of open sites is limited by the small number of excavated southern sites. Surveys make it possible to identify a peak in the

occupation of open sites during the sixth century in southern Etruria, followed by a decline during the fifth and fourth centuries. This is especially noticeable in the territory of Caere. The city of Veii and its southern territory, in the corridor between the Arnone and the Tiber, seems to have had a peak in the sixth century and more restrained occupation in the fifth, until the Roman conquest in 396. The northwest sector of the territory of Vulci, in contrast, gravitating around the middle and lower Albegna Valley, seems to have been particularly active in the course of the fifth century and much of the fourth.³⁵⁶⁶

4The rural landscape in Etruria: An attempted synthesis

In the Late Iron Age (the middle decades of the eighth century), the Etruscan city is fully configured. Institutions are under the stable control of the aristocratic class, who were at the top of a complex social structure that includes a servile class. Aristocrats encourage the development of artisanal activities within the urban fabric, which support a high level of production and drive a complex network of exchanges and gifts connected with commercial routes in the western Mediterranean. At least in the Tyrrhenian area, this phase witnesses the construction of the Etruscan territorial states, with the reoccupation of settlements on smaller plateaus. This should be understood as part of the expansionist policies of the Etruscan cities in a territory of influence that was produced by a complex network of alliances and agreements between *aristoi* who exercised a recognized power from the city. Between the late eighth and the early seventh century, the structure of the landed aristocracy becomes visible, which establishes and guarantees family power over arable land that can be transferred by inheritance. Despite the difficulty of focusing on archaeological indicators, I have proposed that monumental tumuli and isolated tombs may indicate the existence of a landed estate, as burial represents a tangible form of control over the land. These tumuli, placed some distance from urban necropolises and/or those of settlements on smaller plateaus, sometimes initiate burial nuclei reserved for descendants and for members of classes lower than that of the dominant group.³⁵⁶⁷

Besides plateau settlements, complex territorial structures are sometimes indicated by sites on high ground, such as the summit of hill ranges, which are often reinforced by embankments and hanging walls and have probable defensive functions (ranging from the control of mineral fields to the protection of the territorial state's boundaries), which were most likely entrusted to parts of the aristocracy peripheral to the urban structure.³⁵⁶⁸

In the final decades of the seventh century, or the Late Orientalizing period,

archaeology signals profound changes in Etruscan society. Aristocratic groups increase in number with the diffusion of rank through offspring, and probably compete for possession of the land and control of production. Some aspects of the conflict may involve land distribution according to family ties expressed in a gentilicial arrangement, which collects the descendants of a common ancestor and those of lower classes under one name. The extent of the phenomenon is not clear, and there are possible analogies with another ancient society with a wealth of evidence and available documentary sources—namely, that of Archaic Rome. Recent studies of land control in monarchic and early Republican society using archaeological evidence have helped to integrate, and in some cases modify, a historiographic vision that has hitherto been built exclusively on literary sources. In the case of early Republican Rome, the effects of the land reforms instituted by Servius Tullius (in particular the creation of the rustic tribes that were named for the gentilicial Roman groups) can be observed in the growth and development of large estates. These are the actual “directional poles” of aristocratic agricultural production in the Roman suburb. At the same time, continued examination of small open sites suggests a form of individual land holdings (often acquired at the expense of nearby cities) implemented by the city against Latin towns from as early as the late Monarchic period.³⁵⁶⁹

In the Late Orientalizing period, archaeological data in Etruria suggest a type of equalization of conspicuous wealth that reaches, in the funerary sphere, standards that are apparently more balanced than in the Early and Middle Orientalizing periods. The rural population, across the open sites, has a complete and diffuse form by the beginning of the sixth century, at least in the south.³⁵⁷⁰

The high density of open sites, as registered in the countryside around Caere, Veii, and Vulci, brings a number of uncertainties into reconstructions of the rural fabric. The first difficulty lies in the substantial variability between the areas of surface dispersion. While most sites have a scatter area of between 0.25 and 0.5 ha, others extend up to 1 ha and beyond, suggesting sites of differing value.³⁵⁷¹ A second difficulty is that many open sites in the countryside around Caere and Vulci that were clearly established in the Archaic and Late Archaic periods are found near tumuli or more ancient tombs that are usually datable to the Early and Middle Orientalizing periods. One possible explanation in these cases is that the open site began in the territory of a landed aristocracy that was marked by the tomb. It is legitimate to think of a gentilicial group that steadily resided on a property long controlled by the family, or else new agrarian allocations that were perhaps worked by the city on former aristocratic land.³⁵⁷²

According to this evidence, it may be thought that the archaeological data highlight various ways of organizing labor, with nuclei of different concentrations of the population living in the countryside. The rural population evident in open sites is a tangible sign of a direct relationship with

the countryside, probably fostered and controlled by settlements on smaller plateaus within the territorial state that was driven by the Tyrrhenian cities. At least in the Archaic and Late Archaic periods, there was broad gentilicial control of arable land that presumes the existence of a landed aristocracy, along with divided farms implemented by the city through the distribution of public land.

Among the prominent signs of gentilicial control in Etruria are the rural building in Poggio Tondo (Scarlino) near Vetulonia, which dates from the second half of the sixth to the first half of the fifth century, and the “Casa delle Anfore” at Marsiliana d’Albegna (Manciano), which was occupied between the last quarter of the sixth and the second half of the fifth century (Figs. 72.5., 72.6.).³⁵⁷³ This building, which is in a suburban area, has the plan of a great urban *domus* (spread over 400 m²) with residential and possibly productive areas arranged around an open quadrangular courtyard. The architectural quality of the building, the presence of Attic ceramics, and the existence of internal and external spaces furnished with grand *dolia* and transport amphorae suggest the activity of a productive and residential site where the products of an agricultural estate were gathered. The presence of other buildings of similar type and date on the summit of Poggio Alto—a short distance from the “Casa delle Anfore”—makes it quite plausible to recognize a suburban aristocratic estate of Marsiliana controlled by an elevated social group that may have descended from local Orientalizing aristocracies.³⁵⁷⁴ There is also evidence of limited, scattered remains that can be related to small open sites in the suburban areas and countryside of Marsiliana. Current research suggests a complex situation in which, starting from the late sixth through most of the fifth century, aristocratic estates existed alongside individual holdings of arable land, which may have been worked under the direction of Vulci, which coordinated commercial transactions connected to the distribution of local wine in the lands of the Celts from the end of the seventh century to the middle of the fifth.³⁵⁷⁵

As for the end of agricultural production in the area, the archaeological record shows a systemic collapse in the first half of the fourth century. This is when settlements in the area display features that can be associated with defense against Roman expansion. Ghiaccio Forte (Scansano), which was already frequented in the Archaic period as a sanctuary (perhaps on the border of Vulcian expansion), became the base of a small gentilicial potentate of the Statie. The mighty fortification of the *oppidum* of Rofalco (Farnese), on the margins of the Selva del Lamone, was inhabited in the fourth century and destroyed following the Roman conquest of the Vulcian countryside, at the beginning of the third century.³⁵⁷⁶

Inland Etruria is yielding interesting data on the rural landscape and recent forms of land ownership. Work in progress between the Val d’Elsa, the Chianti Senese, and the Valle dell’Asso has revealed a wealth of information on open sites and their populations from the Orientalizing period to the

Romanizing phase, which concluded with the civil war between Marius and Sulla at the beginning of the first century BCE. Surveys between the cities of Volterra and Chiusi have highlighted significant activity in the countryside during the sixth century that was driven by a very strong gentilicial system. Development in the Archaic period, followed by decline during the fifth century with the abandonment of the countryside for the nearby cities, led to the consolidation and expansion of their handicraft and workshop activities. There followed a noticeably strong revival of the rural settlement system between the fourth and third centuries and the end of the second century, which is visible in the remarkable number of new open sites, particularly in the upper Ombrone Valley. At a methodological level, it is interesting to observe that the gentilicial organization of the landscape has survived in the Sienese countryside in toponymy of Etruscan origin which is often recognizable as gentilicial names ending with the suffix-*na* (for example, the present place name Percenna derives from the gentilicial name *Perkna/Perkena*).³⁵⁷⁷

Fig. 72.5: Marsiliana d'Albegna, Poggio Alto: view of the eastern elevation of the "Casa delle Anfore." On the left is the entrance of the building; on the right is a *dolium* placed against the outer wall (photograph by the author)

The *Tabula Cortonensis* is an important second century document that sheds light on a land sale between the olive grower and merchant Petru Scevaś and the *gens* of Cusu, members of the local aristocracy, in the countryside of Cortona near Lake Trasimeno, which was ratified by the public authorities of Cortona. The bronze tablet offers a detailed and fascinating insight into historic, economic, and social conditions in inland Etruria on the

eve of Romanization, and provides valuable information on the type of crops grown (especially olives and grapes) and the organization of land ownership in the Hellenistic period (Fig. 38.2).³⁵⁷⁸

Fig. 72.6: Marsiliana d'Albegna, Poggio Alto: three-dimensional reconstruction of the “Casa delle Anfore” showing the placement of pottery found during excavations (2006–9; reconstruction by D. Calamandrei; courtesy D. Calamandrei)

VI. Etruscans outside Etruria

Southern Italy

Teresa Cinquantaquattro and Carmine Pellegrino

73Southern Campania

Abstract: The coastal strip near Salerno represents the farthest southern frontier of Etruscan expansion. At the beginning of the ninth century BCE, groups who practiced cremation pushed into it from southern Etruria, reaching the Agro Picentino and the Diano Valley, where they stimulated the birth of the centralized proto-urban settlement, which also involved and integrated the native component of the population.

With the arrival of the Greeks on the Campanian coast there emerged an integrated economic and cultural system, ruled by aristocracies that shared interests and models of behavior transcending their different ethnic origins. In this context the Etruscans continue to represent the propulsive element in the dynamics of political structuring, guiding the processes of urban formation that in the Archaic period also involve the areas of indigenous traditions of the Sarno Valley and the Sorrentine Peninsula. The broad diffusion of the Etruscan language and of the *bucchero* testifies to the cultural and political hegemony held in this period by the Etruscans, which is manifested symbolically in the elaboration of the geographic notion of *Tyrrhenia*, transmitted by the literary sources and still operative in the fourth century BCE when the Italic peoples of the Samnite tradition achieved supremacy.

Keywords: Villanovan, Pontecagnano, Pompeii, Fratte, *Tyrrhenia*

Introduction

“Southern Campania” is the coastal strip between the Sarno Valley and the Sele River (Fig. 73.1).³⁵⁷⁹ The district includes the plains of the Sarno Valley and the Agro Picentino, closed off on the east by Apennine spurs and split by the watershed of the Sorrentine Peninsula, which separates the Bay of Naples from the Gulf of Salerno. The Sarno River plain, with the bulk of Vesuvius towering over its coast, opens northward toward the wider Campanian plain, the location of Etruscan Capua and the adjacent district of the *mesogeia* (the “middle earth” between the Campanian plain and the Sarno Valley), which was organized around the settlements of Nola and Avella (see chapter 74 Bellelli). The Sarno river Valley, by way of its tributary the Solofrana, leads to the Irno river, whose valley provides entry toward Hirpinia or descent toward the coast, where the Romans founded Salernum in 197 BCE. The pre-Roman settlement at Fratte arises farther to the rear, at the spot where the Irno and the Grancano rivers meet, which leads toward the south on the broad plain of the Sele. North of the river, the plain bears the name Agro Picentino. In it lay the Etruscan center at Pontecagnano and, at the entrance to the Sele Valley, the ancient settlement at Eboli. Continuing up the river, it is possible to advance toward Hirpinia or to enter the broad plain of the Vallo di Diano, that

Tyrrhenians is *Marcina* (Strabo 5.4.13), situated between the Cape of Sorrento and the Sele and probably to be identified with Fratte; in Tyrrhenia are located, besides Picentia (Steph. Byz. s.v. *Picentia*) – that is, Pontecagnano – the *poleis* of Nuceria (Nocera; Philistus, *FGrHist* 556.43) and Sorrento (Steph. Byz. s.v. *Surrention*), according to a widespread notion of the Etruscan *paralia* (coastal strip), including the Sarno Valley and the southern part of the Bay of Naples, which, as we shall see, goes back to the Archaic period.

1The Early Iron Age: The Villanovan phase (ninth to third quarter of the eighth century)

1.1The “Villanovan” of southern Campania

At the beginning of the ninth century, on the Sele Plain and in the Diano Valley, there appear communities of Villanovan culture who practiced cremation. Their presence, in contrast with the people who instead practiced inhumation that distinguish the Sarno Valley (*Fossakultur*) and the Apennine hinterland, fuels the debate over the interpretation of the “Villanovan” itself. It is a debate that distinguishes between those who—beginning with Renato Peroni³⁵⁸⁰—consider it a sociopolitical epiphenomenon without ethno-cultural significance, and those who emphasize its ethnic content, connecting it with the subsequent Etruscan manifestations. In this second view, the appearance of the Villanovan community in Campania is connected with a migratory movement from southern Etruria, which in the case of southern Campania could have been accomplished by sea.

The migration thesis seems preferable in light of other considerations, if we take into account controversial aspects of the archaeological evidence. Given that the phenomenon arose quite early in the process of ethno-cultural formation, it is not surprising that the Campanian “Villanovan” has developed characteristics of its own.³⁵⁸¹ Nor is it necessary to suppose that the Villanovan expansion would have occurred in sharp conflict with the local peoples of the *Fossakultur*. On the contrary, there emerge signs of contact and interaction between the two components of the population, which lead us to suppose the existence of mobility and attraction in both directions and of varying intensity. Interpretation of the acceptance into the Villanovan settlements’ ceramic repertoire of vase forms typical of the *Fossakultur*, for example, leads in this direction.³⁵⁸² A similar reading can be applied to the presence of Villanovan ceramics in the first levels of the Early Iron Age (phase I) in the inhabited area of Longola (Poggiomarino), on the Sarno River, where the phenomenon tapers off in the following levels (phase II).³⁵⁸³ A similar key to reading applies to the development of the settlement at Sala

Consilina, in the Diano Valley, where around the middle of the eighth century, despite continuity in the dwelling-places, the original Villanovan culture disappears, absorbed by the indigenous Oenotrian component, which was initially present within the community.³⁵⁸⁴ Also unsuccessful was the attempt to take up residence south of the Sele on the initiative of small groups, like that indicated by the group of tombs discovered in Capodifiume, behind Paestum.³⁵⁸⁵

1.2 Settlement choices and social structure

In the perspective outlined here, the groups of people who belonged to the Villanovan culture took shape as the moving force in a process of renewal that also involved the local components of the population. The innovative impulse is recognized in particular in the settlement choices, which recall those in the same period in other areas historically occupied by the Etruscans, in Tyrrhenian Etruria and on the Po plain. In southern Campania as well, the Villanovan settlements have a protourban character. They are extensive centers able to control vast territories and to plan the settled space in accordance with criteria that were to remain in effect over a long period, as is shown by the fundamental distinction between the large area used for dwellings and the necropolises.

The best-known case is represented by Pontecagnano, in the Agro Picentino (Fig.73.2).³⁵⁸⁶ The Early Iron Age necropolises are set around the inhabited area, which presumably developed on the travertine plateau occupied by the city in the historical period. They were established along the road leading out of the inhabited area, and in relation to significant elements of the landscape. The two main necropolises are located at the sides of the plateau, separated from it by the lowland in which the surface waters flowed. Associated with the main settlement is a village, some 2 km to the south, in Pagliarone. Located on a terrace extending along the coastal plain, it would have been in control of the salt lagoon (the Lago Piccolo of historical maps) in which the port of the Villanovan center can be identified.³⁵⁸⁷

generally lined and covered with pebbles, was extremely rare in the first phase, but was more widely diffused beginning in the second half of the ninth century. The tombs initially reflect groups organized on the basis of gender. Especially noteworthy is the figure of the adult warrior, evoked by the helmet-shaped lid of the urn and by the spearhead deposited in the grave goods; female figures are associated with spinning and weaving tools.

Already during the ninth century, distinct in the funerary areas are clusters of burials centered on figures of warriors armed with swords, an expression of the growing social stratification that led to the concentration of power and wealth in the hands of a few family groups.³⁵⁹³ The centrality of the warrior figure, through which ties of ancestry and descent were valorized, is also evoked by an unusual *impasto* helmet topped by a sculptural group that depicts a tall female figure embracing the shoulders of the man who originally owned the helmet (Fig. 18.1).³⁵⁹⁴ The scene might represent the welcome of the warrior to the afterlife by a goddess connected with the realm of death.

Beginning with this phase, Pontecagnano was involved in a complex network of relationships and exchange that involved the Tyrrhenian basin. Confirmation is found not only in the imported materials—from Etruria, Sardinia, Calabria, and Sicily—but also the phenomena of personal mobility, such as those hypothesized in relation to the hut urn from Tomb 2500, which goes back to Latium and Etruria, and a pair of warriors armed with swords and greaves, for which an origin in the Calabrian settlement of Torre Galli has been proposed (Tombs 180 and 889).³⁵⁹⁵

1.3 Contact with the Greeks: The second phase of the Early Iron Age

In the first half of the eighth century, the system of exchanges in the Tyrrhenian region intensified due to the Greek frequentation of the coastlines that preceded the foundation of the colonies. The archaeological evidence for these contacts consists of *skyphoi* decorated with hanging semicircles, chevrons, meanders, or birds, made primarily in Euboea and documented in the necropolises of Pontecagnano in highly significant numbers.³⁵⁹⁶ These vessels were reserved for ceremonial wine consumption, introduced by the Greek merchants as a practice for initiating hospitable relations with the local elite, which were by now widely established, and stably controlled the resources and exchanges. The elite used special burial areas, carefully laid out, and exhibited the eminence of their position through the architecture of the tombs, often topped by monumental structures, and in the funeral ritual, which now stressed the importance of certain female figures indicated by richer ornaments, as well as by the usual signs of tasks connected with domestic activity.

The system of relations and trade in the Tyrrhenian region was consolidated around the middle of the eighth century when the Greeks of Euboea founded the settlement of Pitheculusae on the island of Ischia. This settlement, in which Greeks lived side by side with Phoenicians and natives, functioned as an outpost for commerce and exchange. From Pitheculusae came not only finished products, but also craftsmen, who opened specialized workshops in Etruria and in other local communities on the Tyrrhenian coast. A little later, the Greek presence was increased further with the founding of Cumae on the Campanian coast facing the island of Ischia. The first permanent Greek colony, it was established on the initiative of the Euboeans of Calchis and the *polis* of Kyme in Aeolis.

The intensity of activity and relationships that crisscrossed the Tyrrhenian basin and the Campanian coast also involved the native population, leading to a new economic growth and producing opportunities of cultural interaction. An example is the Sarno Valley, where the agricultural villages at San Marzano sul Sarno, Striano, and San Valentino Torio became intermediaries with the Greek world for acquiring agricultural resources. This is seen from the presence of Greek or Greek-type ceramics in the burials, as well as the attestation of a particular production that decorates forms from the local repertoire with Pitheculusae-style motifs.

In the Agro Picentino, a meaningful dynamic connected to the new situation is the appearance of a series of settlements that integrate the earlier territorial system in which Pontecagnano and Eboli played an important role.³⁵⁹⁷ The new settlements, known solely from the necropolises, arose with the purpose of better exploiting the opportunities offered by the intensification of trade, and were placed near coastal landing-places and river fords in strategic spots for maritime and terrestrial communication. In the new landscape, the settlement that developed along the slopes of Monte Vetrano at the confluence of the Grancano and Picentino River valleys took on a central role protecting the access routes from the north into the Agro Picentino and in connection with the ford and a likely river landing.³⁵⁹⁸ The burial evidence attests to the prosperity of the settlement, which derived from its integration into the system of Tyrrhenian trade, in whose sphere it functioned as the aggregator of inland products. For example, in the female Burial 74, which dates to the third quarter of the eighth century, rich ornaments are associated with a set of imported bronze vessels (Fig. 73.3).³⁵⁹⁹ The Kurd-type situla, the biconical vase, and the censer are Etruscan in origin; the corded *cista* was imported from the Adriatic area; the little Nuragic boat came from Sardinia; the cauldron is of Euboean type; and the bowl decorated with an embossed row of bulls and an underlying frieze of heifers suckling calves arrived from the Near East. As for the men's side, Tomb 51 is exemplary. The deceased, known to be a warrior from the iron sword and the spearheads, is also accompanied by iron tools and sacrificial equipment—a hatchet, an ax, two knives, and a bundle of skewers—and by a bronze cauldron and basin.³⁶⁰⁰

Fig. 73.3: Tomb 74 of Monte Vetrano. Bronze vessels at the foot of the deceased (after Cerchiai and Nava 2008–9)

The function and degree of openness of the community are also evidenced by the presence of tombs that refer to the Hirpinian environment of the Oliveto Citra-Cairano culture; by imports from the Sarno Valley, the Campanian plain, and *Oenotria*; and especially by objects and contexts that recall Greece and the Near East. Aside from the bronze bowl from Tomb 74, particularly indicative are a scarab from the Lyre-Player Group,³⁶⁰¹ with a complex dance scene around an amphora (Fig. 73.4), and Tomb 111, in which the remains of a cremated woman, together with an impasto spindle whorl and burnt fragments of a *skyphos* with chevrons, are gathered in a bronze urn similar to examples from Eretria, following a ritual that goes back to ideological Hellenic models.³⁶⁰²

Apart from Montevetrano, other settlements destined to the control of the territory and exchanges developed on the coastal strip, close to the lagoons used as landing-places. Casella, on the lagoon north of the Tusciano River, took on the functions previously assumed by Pagliarone, which meanwhile had become disused.³⁶⁰³ A second settlement was found farther south, in Arenosola, on the sandy spit bordering the broadest lagoon on the right bank of the mouth of the Sele.³⁶⁰⁴

At Pontecagnano, the flourishing activities connected with the intensification of Tyrrhenian trade brought the subsequent acceleration of social dynamics, causing the emersion of groups that centralized control of the resources in their own hands. As for funerary practices, they exhibit behaviors that foreshadow the princely ostentation of the Orientalizing period, with burials characterized by monumental structures and highly complex grave goods in which bronze vases stand out; and, for female burials, sumptuously ornamented jewelry.

2The Orientalizing period: The world of the *principes* (ca. 725–625 BCE)

By the last quarter of the eighth century, the process of social differentiation appears to have been firmly settled. For this chronological horizon, the sole evidence concerning the inhabited area of Pontecagnano comes from the southwest edge of the city, between the Via Bellini and the Via Verdi, where the sanctuary of Apollo rose in the Archaic period.³⁶⁰⁵ Dating from the end of the eighth to the beginning of the seventh century, a wide open area appeared here, occupied by huts with wells and a pottery kiln. The fact that the great central space remained unbuilt in the following phases of the sanctuary suggests that the area had a public function from the beginning.³⁶⁰⁶

Once more, it is the necropolises that represent the main source of information. At Pontecagnano there are some aristocratic groups—holders of hereditary power—who steered the mechanisms of political and social functioning of the community. Though areas utilized in the Early Iron Age were abandoned, the necropolises continued to be distributed in the two extensive funerary sectors to the east and southwest of the inhabited plateau, into zones previously crossed by ancient river beds and then reclaimed.³⁶⁰⁷ To it was added a smaller area of burials placed on a lower terrace of the plateau, near the present-day Piazza Risorgimento. In a funerary landscape structured into family plots and monumentalized, close to the tombs, near enclosures or small altars where funeral rites and ceremonies were carried out, are the “princely” burials that represent the ideology of the ruling classes. These

show—albeit with general sharing of values—the dialectical coexistence of various strategies of self-representation. Three indicators signal the distance of these eminent burials from the rest of the community. First is the funerary ritual, which reserves for the *principes* especially elaborate treatment, such as cremation, as compared with the generalized use of inhumation by that time. Second is the structure of the tomb, within which the remains of the deceased and the objects are deposited according to precise selective logic. Third is the grave goods that, with the inclusion of imports from Etruria, Greece, and the Near East, alongside the basic service that united all the burials of the time, show a capacity for relationships of broad scope and considerable economic resources for the acquisition of prestige goods.

In the western necropolis, Tomb 4461 is the earliest princely burial and dates to the end of the eighth century. It belongs to a warrior who was about fifty years old,³⁶⁰⁸ whose bones were deposited in a chest made of travertine slabs, following a secondary burial ritual used as ostentation tool from aristocracies. This is attested in Archaic Rome in the Laws of the XII Tables, which limit the use of this ritual to cases of death in war or on foreign soil. The bones of the deceased, which underwent ritual manipulation, were first subject to burial or defleshing, and were subsequently deposited in the tomb using a careful process of selection that led to the exclusion of the skull.³⁶⁰⁹ Partly the bones were found on the floor of the chest, partly in a bronze *lebes* or a bronze Kurd-type situla imported from the Etruscan city of Vetulonia. The group of large bronze containers is completed by a biconical amphora made in Etruria. In addition to imported vases (a Phoenician plate in red-slip ware, a globular Proto-Corinthian *aryballos*, an *oinochoe* from Pithecusae), the grave-goods includes sacrificial tools (an ax and a knife), arms (spears), and an extraordinary pair of bronze plated masks for horses (*prometopidia*), perhaps used during the funeral ceremony. Most likely made in Vetulonia by a craftsman from the East, the masks bear embossed figural scenes, inspired by the world of the hunt (Fig. 73.5). The two sides of the better-preserved example depict an archer shooting an arrow at a lion who is attacking a goat, a running stag, and a pair of facing wild boars.

Fig. 73.5: Pontecagnano. Horses' mask from Tomb 4461 (after Cerchiai 1995)

Dating to a generation later are the princely tombs 926 and 928 from the necropolis of Piazza Risorgimento, both male cremations.³⁶¹⁰ They exhibit an articulated architecture, with a pit lined and covered with travertine slabs placed in the middle of a travertine enclosure (Figs. 19.4., 19.5, 73.6). In the central pit a bronze cauldron holds the ashes of the deceased, carefully wrapped in a cloth fastened with a fibula, following a ritual typical of the Euboean aristocracy that is attested in some aristocratic burials in Cumae from the end of the eighth century, such as Tomb 104 of the Fondo Artiaco. The ideological return to heroic funerary practices that date to the time of Homer—like those reserved for Patroclus and Hector—reveals the cultural and ideological references on which the Etruscan aristocracy's funerary practices were based. Shaped on models developed in the Greek environment of Cumae, whose influence also touches the apices of the native community of the Campanian hinterland, demonstrate a sharing and solidarity between the ruling groups that is thick with meaning.

In tombs 926 and 928, the central pit held—in addition to the remains of the deceased—a valuable set of silver and bronze wine and banquet vessels imported from Greece, the Near-East, and Etruria. Outside the pit but still within the enclosure, were found elements that represent the social role of the *princeps*: arms, parts of carriages, sacrificial equipment for butchering and roasting meat (an ax, knives, spits, andirons, and tongs), large storage vessels (amphorae), and a bronze tripod in Tomb 928.

The key elements around which the social identity of the *princeps*—to whom the status of hero and progenitor is attributed—was constructed is clear: war, thus the management of foreign relations and conflicts; sacrifice and symposium, thus governance of religious practices, rituals, and social relations; and wealth, thus exercise of power that is both political and societal.

Fig. 73.6: Pontecagnano. Plan of the tomb 928. (based on d'Agostino 1977, fig. 13)

Such forms of social recognition were not reserved only for men. To the female figure as guarantor of the continuity of the family and hereditary

transmission, was also accorded a funerary ritual of the princely type. This is the case of Tomb 2465, found in the eastern necropolis in San Antonio, near an infant burial area organized around the enclosed space of a funerary cult.³⁶¹¹ The inhumation burial, dating to the late eighth century, is covered by a large tumulus that until the first half of the sixth century received mostly burials of women and children. In this context, the men's tombs, marked by arms, occupy a marginal position that don't exhibit any specific indications of prestige.

Fig. 73.7: Pontecagnano. Inscribed chalice from Tomb 3509 (after Colonna and Pellegrino 2002)

The woman in Tomb 2465 was clothed in sumptuous garb, the lower half covered by a mesh of bronze ornaments and enriched with a pectoral and diadem in sheet gold; she wore bracelets and earrings of silver, and necklaces of silver or with figural amber pendants. But it is not merely for its sumptuous apparel that the burial is known, but for the exhibition of those signs of power, which in the western necropolis are the prerogative of the *principes*: the carriage, the sacrificial tools and the hearth, wine service, and the large containers for foodstuffs.

An internal dialectic suffuses the ruling elite: in comparison with the aristocratic identities that emerge at the same time in the western necropolis, two elements are to be stressed regarding Tomb 2645 and its group. The first is the significance accorded to the female and infant element of the community; the second is the exhibition, by indicators such as the impasto ceramics imported from Etruria-Latium, of privileged relations with the Etruscan and the southern elite. The pottery indications, like the rest of the grave goods, allow us to trace the various exchange circuits along the routes that put Campania into communication with Etruria, whereas the composition of the grave goods well describes the open character of the Picentine community which, in this decisive phase for its urban transformation, expresses a powerful capacity for social integration.

As a demonstration of the phenomena of mobility that simultaneously also affected the Greek world of the Tyrrhenian coast,³⁶¹² the two main necropolises contain burial plots that can be attributed to a portion of the population assignable to the Hirpinian culture of “Oliveto Citra–Cairano.” This circumstance appears to fit organically into the contemporary structuring, on the inland hills, of small settlements inhabited by families of Hirpinian origin. These families moved from the valleys of the Ofanto and the upper Sele, and settled along the middle valley of the Picentino, at Montecorvino Rovella and Santa Maria a Vico, following a trail already blazed earlier by individuals, as the case of Monte Vetrano seems to show.

Thus the economic supremacy and policy of control of the anchorages, of the agricultural territory of the plain, and of the resources of the wooded hinterland, were the source of the power of the Pontecagnano elite. The attraction exercised by Pontecagnano toward the Tyrrhenian coast mirrors on the one hand the radiation of Etruscan cultural influence over a vast extent of territory, on the other the activation of developmental processes within the native component of the population. In this sphere, in which a decisive role must have been played by the settlement of Eboli, which could not be avoided along the route that connects the Sele Valley to the Ofanto Valley via the saddle of Conza, the presence of “princely” burials at Bisaccia acquires its significance. In Tomb 66, of the second quarter of the seventh century, the deceased woman was clad in a garment embellished with copious bronze decorations and a rich display of ornaments, and was accompanied by indicators of princely prestige, such as a set of bronze vessels from Pontecagnano (a cauldron, two basins, and a *phiale*) and iron spits.³⁶¹³

Far from taking shape as isolated phenomena, therefore, the processes of cultural interaction appear to be a constituent feature of the community of Ponte-cagnano, whose Etruscan character, well represented in the historical tradition, finds its most significant confirmation in the extremely rich inscriptional corpus, which counts over seventy items.³⁶¹⁴ The earliest inscriptions, aside from isolated letters and marks already attested in contexts from the first half of the century, date to the middle and third quarter of the

seventh century. We refer to two inscribed vases recovered from child burials. The first (Tomb 6034) has the beginning of an abecedarium;³⁶¹⁵ the second comes from the burial of a one year old baby (Tomb 3509), for whose funeral a couple—probably the baby’s parents—had given an impasto chalice (Fig. 73.7).³⁶¹⁶ In this inscription, the use of the onomastic formula with two elements—the *praenomen* and the gentilic name (*Rasunie*)—reflects a society in which blood relationships dominate and the hereditary system guarantees the lineage and the transmission of power.

3The urbanization process (last quarter of the seventh to the sixth century)

At the turn of the sixth century in southern Campania there took place a profound reorganization of the settlements’ planning, connected with the process of urbanization that extensively affected mid-Tyrrhenian Italy and Magna Graecia.³⁶¹⁷

In the inhabited area a clearer allocation of space can be recognized. Especially indicative is the definition of the cultic areas, which provides evidence of the public dimension assumed by the sacred in the reorganized urban context.

The system of cities also took over the territorial divisions that had previously been organized according to a system suited to a scattered population. In the Sarno Valley, a huge process of agglomeration led to the abandonment of the villages that went back to the Early Iron Age in favor of Pompeii and the newly founded city of Nuceria, signaled by the opening of necropolises located outside the area that would be enclosed by the walls in a later period.

In the Sorrentine Peninsula, the population was structured into a series of settlements and stopovers. The northern slope was more densely occupied, where the settlement of Stabiae was joined by the major one of Sorrento, in which, as at Nuceria, the necropolises of the beginning of the sixth century were located outside the urban perimeter subsequently defined by the walls. Minor centers also developed at Vico Equense, Piano di Sorrento, and, along a route to the inland, Sant’Agata dei due Golfi.

On the southern slope, the settlement of Vietri sul Mare was placed at the start of the peninsula, in a location sheltered from the winds and currents. In this area of the Gulf of Salerno, the main center consists of the settlement of Fratte, founded at the beginning of the sixth century on the Irno River to control the inland route connecting the Sarno Valley and northern Campania to the Agro Picentino. It is to be identified with the Etruscan *Marcina* registered by Strabo (5.4.13), called *Mamarcina* and believed to be an Ausonian foundation in another tradition probably going back to Hecataeus of

Miletus (Steph. Byz. s.v. *Mamarcina*).³⁶¹⁸

The reorganization of the settlement planning connected with the achievement of the urban system was accompanied by the diffusion of Etruscan culture, which a long-accepted scholarly tradition considers to be the outcome of a “second colonization” (see below). Actually, the “Etruscanization” of the Archaic period does not derive from a migratory movement, nor from a planned form of political hegemony, but constitutes the outcome of a process of integration of the various components of the population under the propulsive and inclusive force of the Etruscan element.³⁶¹⁹

The most obvious sign of the process of “Etruscanization” consists of the diffusion of Etruscan writing into areas of native traditions. Already documented in the first half of the sixth century at Stabiae, it went on to wider diffusion, as is proven by the various attestations that come from centers on the inland plain, Pompeii, and the Sorrentine peninsula. The writing system is the one used in the areas of the earliest Etruscan traditions of the Campanian plain and of the Agro Picentino, which in this early phase followed the scribal usage of Caere and Veii.³⁶²⁰

No less indicative is the spread of bucchero, the typical Etruscan dinnerware, which was being produced throughout the Etruscanized areas of the region with a broadly shared repertoire of forms and types.

“Etruscanization” functioned to integrate the various regional areas, but did not annul earlier distinctions in the population. In southern Campania, the difference remained between the Sarno Valley along with the northern slope of the Sorrentine Peninsula, and the Agro Picentino. As for material culture, it is indicative the pottery made of fine impasto, which was produced consistently until the middle of the sixth century according to typological repertoires characterized by thoroughly local emphases. Also significant is the frequent attestation in the necropolises of Vico Equense and Stabiae of a particular type of “serpentine” fibula with an acorn-shaped projection. The area of distribution of this fibula, which traces the inland route to the north but excludes the Agro Picentino, where it is rarely found, suggests a network of mobility that links the Sorrentine coastal strip and the Sarno Valley with the inland plain and the Campanian area.

A later and still more significant confirmation of the distinction between the two Etruscanized areas of southern Campania is offered by the epigraphic evidence, which at Nuceria, Vico Equense, and Sorrento attests the use of a pre-Samnite Italic dialect written with a local alphabet related to those attested in the central-Italic Sabine and South Picene area and in “Oenotrian” Calabria.³⁶²¹

The “Nucerian” alphabet is documented from the middle of the sixth century. Among the earliest attestations figures the inscription on a bucchero cup from Tomb 107 in Nuceria that bears a notation in which the expression *teu(tik-) pu(terem)*, the “public cup,” has been recognized as referring to the

typically Italic institution of the *touta*, which designates the political community.

The elaboration of its own writing system is the sign of a special cultural and political identity defined in oppositional terms in respect to the Etruscans.

The specificity of this territorial division is registered in the historiographic tradition, which places the Sarrasti in the Sarno Valley and transmits the presence of Pelasgians at Nuceria, Pompeii, and Herculaneum. Pelasgians generally tend to be identified as Etruscans, but in this particular case are more suitably associated with the indigenous urbanized communities that are definitively distinguished by the possession of writing.³⁶²²

At the beginning of the sixth century, the founding of the colony of Poseidonia on the plain of the Sele profoundly changed the population balance in southern Campania. It is with this backdrop that the Sorrentine Peninsula, which separated the Gulf of Cumae from the Gulf of Poseidonia—as the ancient historians called them—acquired importance. The peninsula was an essential navigational reference point and an inevitable area of economic and political competition, as the system of myths and the cults make clear. The ancient cult of the Sirens, situated near the Bay of Ieranto, was introduced by the *polis* of Cumae, which took the mythic model of the voyage of Odysseus to assert control over the passageways needed for the route to the Bay of Naples.³⁶²³ On the promontory opposite that bay, at Punta Campanella, rose the temple of Athena, also attributed by the tradition to Odysseus, which around the middle of the sixth century was faced with architectural terracottas of the Poseidonian type.³⁶²⁴

The cults and the sacred architecture constitute preferential markers for reconstructing the system of relationships between the various components of the population of ancient Campania. Widespread was the “Campanian system” (Fig. 73.8),³⁶²⁵ a system of polychrome terracottas on the face of sacred edifices constructed in the Etruscan manner, with mudbrick walls, and mostly wooden columns and entablatures mostly of wood. This was devised in the first half of the sixth century in northern Campania, at Cumae or Capua—priority cannot yet be attributed to one or the other—but during the last quarter of the century it spread throughout southern Campania, to Pompeii and the Sorrentine Peninsula (the Athenaion of Punta Campanella, Sorrento), Fratte, and Pontecagnano.

It is significant that, alongside the “Campanian system,” some centers also adopted architectural models from Poseidonia, to illustrate the variety of relationships consolidated through public commissions.

Fig. 73.8: Revetment system of the Temple of Apollo at Pompeii (after De Caro 1986)

Particularly interesting is the process of urbanization at Pompeii (Fig. 73.9).³⁶²⁶ At the beginning of the sixth century the inhabited terrace was surrounded with a fortification wall of blocks of local “pappamonte” tuff, which defined the urban limit maintained in the successive reconstructions of the wall at the beginning of the fifth century and the end of the fourth. The Archaic period finds testify to an extensive—albeit non-homogeneous—occupation of the entire enclosed area, with dwellings alternating with unbuilt spaces. The occupation of the western sector was intense, where evidence of public and sacred character is also concentrated. To the northeast, near the “Casa della Colonna Etrusca” (*regio* 6.5), was a small sanctuary enclosed within the dedicated setting of a beech grove, and for this reason known as the

cult of Jupiter. In the southwest corner of the built-up area rose the political and monumental quarter of the city (the *Altstadt* or Old City). Covering about nine hectares, it dominated from above a bend in the Sarno River, in which the port mentioned in the sources was probably established. The quarter was crossed by the two main avenues of the Archaic street plan, the “via Marina” and the southward continuation of the “via di Mercurio” (“via delle Scuole”), which cross at right angles in correspondence with the plaza revived as the Forum in the Roman period. This part of the city is encircled by a ring road that seems to respect a boundary marked in the previous phase by a wall and maybe a moat, of a still controversial date, which in any case is evidence of the special function carried out by the topography of this sector of the city. Within it was located the plaza of the Forum, which was already meant to be a public space at that time, and faced the sanctuary of Apollo, the political and religious heart of the community.³⁶²⁷ The temple, built around 550–530, is of the Etruscan type, with a high tuff platform and wood elevation (Fig. 73.8). The rich facing returns to the “Campanian system” and was probably made at Cumae. The choice of Apollo as patron of the urban foundation is not surprising when we recall the importance of this god in the Greek colonization in the West and the role of cultural and political mediation between the Greeks and the other peoples that he played in the sanctuary of Delphi.³⁶²⁸ As guarantor of the urban foundation, temple edifices are dedicated to Apollo in the public areas of many Etrurian and Magna Graecian cities, probably beginning in Poseidonia itself. With the temple’s Etruscan architecture, instead, the community of Pompeii claims its own cultural coordinates and its integration into the wider regional system structured under the influence of Cumae and Capua.

Fig. 73.9: Map of Pompeii with localization of the archaic finds (based on Pesando 2010)

Fig. 73.10: Pompeii. Map of the temple in the “Triangular Forum” (after De Waele 2001)

The second great sanctuary of the city, dedicated to Athena and probably Heracles, rises in the “Triangular Forum,” placed outside the ring road of the *Altstadt*, on a spur on the southeast edge of the terrace of the built-up area overlooking the port. The temple is the same age as Apollo’s temple, but is of the Greek type (Fig. 73.10), with a stepped base and a cella surrounded by a peristyle of Doric columns (seven on the short side, eleven on the long).³⁶²⁹ Not much is preserved of the original facing. The architectural terracottas from a refacing dating to around 500 are better known. Comparison with the sacred architecture of Poseidonia suggests the participation of a workforce from the Greek city. The decorative scheme provides for a cornice decorated with a double-braided motif and eaves (*sima*) with lion-head dripstones on their long sides, a large torus with scales on the short sides, and a series of serpent heads in the middle. It is a representation of the Hydra, which evokes the episode of its slaughter by Heracles, the civilizing hero who in the course of his miraculous labors was received by distant foreign populations following the hospitality laws and giving Heracles the appropriate welcome from a politically structured community. His presence alongside Athena suggests the purpose of the sanctuary, which, in relation to the port, must have developed a function of welcome and acceptance. At the foot of the built-up area, at the edges of the coastal lagoon connected to the mouth of the Sarno, the sacred areas in Sant’Abbondio, Fondo Iozzino, and Bottaro were located. The last of these was connected with Neptune in the Roman period, a god originally linked to springs and flowing waters.

Fig. 73.11: Fratte. Plan of the ancient settlement (courtesy R. Pinto)

At Fratte, on the Gulf of Salerno, the purpose of the spaces is also defined at the moment of the center's foundation at the beginning of the sixth century

(Fig. 73.11).³⁶³⁰ The settlement developed on the upper slopes overlooking the Irno River, bounded on the other two sides by its tributaries, the Grancano and the Pastorano. To this first phase belongs a large apsed shelter at the northern edge of the inhabited area, near the left bank of the Pastorano. The necropolises are located beyond the stream, and probably developed in relation to the accessway that went up the Irno Valley.

The qualitative leap marked by the urbanization process can be followed more easily at Pontecagnano.³⁶³¹ Beginning in the late seventh–early sixth century, the eastern sector of the inhabited area took on a primarily artisanal purpose signaled by the installation of tile and pottery kilns. On the western slope were two sanctuaries.³⁶³² The first was located in the “public” area of Via Bellini-Via Verdi and is dedicated to Apollo, as shown by a series of vase dedications distributed throughout the period from the sixth to the fourth centuries. The dedications are written in Greek, in the Achaeon alphabet of Poseidonia, a recurrence that has led to the hypothesis of attributing their drafting to personnel of the cult who came from the Greek *polis*. To the dedications is added an Etruscan inscription that names *Manth*, an Etruscan god connected with the process of founding a city, assimilated in the Roman scholarly tradition to Apollo himself (see [chapter 18](#) Maras).³⁶³³ The placement of the sanctuary, facing the plaza in the public area of the city, is evidence of the political value of the sacred area, which would have allowed for the function of the cult of Apollo to be defined according to the model already described for Pompeii.

A second sanctuary was founded to the northwest, in the suburb of Pastini, on an outcropping of the plateau cut by torrential gullies. It was dedicated to a chthonic goddess, linked to the sphere of fertility and rites of passage, as transpires from the votive offerings that include shapeless pieces, round “loaves” and bars of bronze, including one with an impression of a dry branch, miniature iron weapons and shackles related to the practice of manumission. The name of the goddess may be recovered from the dedication on a bucchero *kantharos*, where the divine name *Luas* has been recognized, an Etruscan goddess corresponding to the Latin *Lua*, “the verdant (goddess),” according to an etymology that evokes the swampy, untamed countryside in which the sanctuary was sited.³⁶³⁴ The sanctuary also yielded a bucchero cup from the late sixth century with the inscription *amina* [---]s, a gentilic that recalls the name of the legendary population of the Aminei mentioned in the sources.³⁶³⁵ In this regard we should mention the discovery at Poseidonia of a silver disc with a dedication in Greek to Hera by “oligarchs of Amina,”³⁶³⁶ which allows us to relate the term to a territorial designation connected to the area of Pontecagnano or a neighboring district.

Fig. 73.12: Etrusco-corinthian pottery from Pontecagnano: *kotyle* by the Wolf's Head Painter (courtesy L. Cerchiali)

The process of reorganization also beset the necropolises, which expanded into adjacent previously unused areas, anyway in connection with the suburban road network.³⁶³⁷ Relevant above all is the development of the necropolis of Piazza Risorgimento, which became the biggest and most important burial area of the settlement.

The new funeral plots remained available to families for several generations and were sometimes provided with equipment connected to the funerary cult.³⁶³⁸ These groups exhibit the most striking forms of funerary luxury, testimony to the economic and social changes brought about by the process of urbanization. The funerary display sometimes contemplates the adoption of cremation, inspired by ideological references and eschatological beliefs stemming from the Greek world. This was practiced above all in the main version of the *bustum*, but cases do exist in which the cremated remains were gathered in Corinthian kraters, following a markedly Dionysiac ritual that is also documented in the Etruscanized area of northern Campania.

Fig. 73.13: Fratte. Juglet from Tomb 26/1963 with Greek inscription. Translation: Apollodoros loves Xylla, Volcas sodomizes Apollodoros, Onata loves Nixò, Ybrichos have loved Parmynis (after Pontrandolfo 1987, fig. 20)

The grave goods provide an illustrative outline of the productive and economic system of the new urban circumstances, evidencing the development of specialized production such as bucchero or ceramic tableware with geometric decoration, which are associated with more exclusive products with figural decoration that imitate the Corinthian style (Fig. 73.12).³⁶³⁹ The recurrence of luxury items imported from Etruria and Greece confirms the inclusion of Pontecagnano in the course of Tyrrhenian trade, notwithstanding the reorganization of the center following the founding of Poseidonia and Fratte.

The city's consumer system increased the center's force of attraction, exercised as in the earlier phase especially toward the Apennine hinterland, which also acted on a much wider radius, as shown by the integration within the western necropolis of Piazza Sabato of a group that came from the middle Adriatic region.³⁶⁴⁰

Beginning in the second half of the sixth century, the increase in epigraphic evidence offers more widespread confirmation of the arrival of individuals and groups of various origins.³⁶⁴¹ The integration within the citizenry passes through the adoption of the language and the Etruscan onomastic system. The case of the Greek *Meliton*, who may have come from Cumae, which gave rise to the Etruscanized gentile name *Milithuna* is emblematic of this system. Other epigraphic evidence instead informs us of the bonds of friendship that local people maintained with foreigners, woven together in particular with Greeks from the nearby Poseidonia and celebrated in the framework of the symposium. Evidence of this type of relationship comes from Tomb 26/1963 in Fratte, dated to the beginning of the fifth century (Fig. 73.13).³⁶⁴² The Greek inscription on a small black-glazed juglet from Poseidonia celebrates erotic practices among people with Greek, Etruscan, and native names in the framework of a symposium held in the Achaean city. Relationships of

aristocratic hospitality are also revealed by the presence of dedications of vessels in Greek, using the Cumaen alphabet, found in tombs in Nuceria and at Massa Lubrense, on the Sorrentine Peninsula.³⁶⁴³

At Fratte, the vase inscriptions in tombs evidence the multifarious components of a community open to mobility and exchange.³⁶⁴⁴ Etruscans, Greeks, and Italics lived together, using the various languages indifferently, employing the Etruscan alphabet or the Greek alphabet of Poseidonia. The same Etruscan component appears varied within it, given that many Etruscan inscriptions move away from alphabetic practices acquired in Campania, exhibiting instead connections with the scribal traditions of Tarquinia and Vulci.³⁶⁴⁵

The extraordinary development of Fratte at the end of the sixth century derived from the function held by the center in the system of Tyrrhenian traffic, which received a further impulse from the founding of the Phocaeen colony of Elea around 540. Fratte became an important stop along the maritime commercial routes that led toward Etruria, acquiring and sorting toward the inland luxury products such as banquet services from Etruscan bronzes. The commercial bent and economic ability of the community are evidenced by the number of transport amphorae found in the necropolises and by the import of Attic figured ceramics, which also include examples of extraordinary merit such as the black-figure *dinos* attributed to the Antimenes Painter (Fig. 73.14) and the red-figure *hydria* of the Kleophrades Painter.³⁶⁴⁶ The large Attic vases are concentrated in specific sectors of the necropolis that pertain to the elite of the community; they were probably used as cremation urns, following the ritual already encountered at Pontecagnano, which seems here to assume markedly “heroic” connotations, as shown by the selection of figural themes—in particular the predilection for the figure of Heracles.³⁶⁴⁷

The powerful dynamism, favored by the productive mechanism of the urban system, brought about an acceleration of the social processes that led to a general reorganization of the community at the end of the sixth century.

The most obvious archaeological confirmation of these changes consists of the qualitative leap noted in the organization of the urban space.

Fig. 73.14: Fratte. Attic *dinos* from Tomb VI–XV/1927 (after Campanelli 2011)

At Fratte (Fig. 73.11), the built-up area is surrounded by a fortification of ramparts supplemented by a moat. The only extensively explored quarter (the so-called “Acropolis”), in the highest part of the city, is organized by a series of parallel east-west streets, crossed by a nearly perpendicular axis.³⁶⁴⁸ The city blocks have buildings of various typologies and sizes, among which is indicated a large residential complex organized around a central court.³⁶⁴⁹ The quarter is served by a complex water supply system, which, using wells, fountains, underground pipes and surface channels, ensured the provision of water and the drainage and disposal of rainwater. The sacred areas are monumentalized contextually.³⁶⁵⁰ One was in the lower part, near a spring along the Grancano stream; the other was in the upper part, integrated into the planned quarter of the “Acropolis.” An enormous quantity of materials has been recovered from sacred areas—albeit out of context—among them architectural elements that attest to the presence of buildings with stone elements.³⁶⁵¹ These materials evidence the influence exercised by Poseidonia, the source of some stone cornices, a series of lotus-flower antefixes different from the “Campanian” ones, and a male head of clay that may belong to a cult statue. These elements are associated with a tuff Tuscan column and

architectural terracottas of the “Campanian” type, perhaps derived from Capuan prototypes, in a mixture that reveals the complex variety of references which speak to the high level of public patronage of the Campanian centers in this period.

Fig. 73.15: Fratte. Acroterion with *Heracles* and the *Nemean lion* (after Campanelli 2011)

Information about the cults is lacking. The most interesting fact concerns the probable rooting of the cult of Heracles in this period, documented on the acropolis in the following Samnite period by an inscription from the area of the sanctuary and by architectural terracottas, among them an acroterion depicting the hero in combat with the Nemean lion (Fig. 73.15).³⁶⁵² This hypothesis is supported by the discovery in a well in the sacred precinct of a Late Archaic gold ring on whose cornelian bezel is depicted the same feat of the hero.³⁶⁵³ The presence of the cult of Heracles already in the Archaic period can perhaps be framed according to the ideological coordinates evidenced in the case of Pompeii and at the same time leads to a reconsideration of the favor found in the funerary sphere for scenes linked to his labours.

At Pontecagnano, the Late Archaic reorganization of the settlement took on the connotation of a real “refounding” of the city (Fig. 73.2).³⁶⁵⁴ The limits of the built-up area came to be redefined, carving beyond parts of the eastern crafts quarter and including a wide marshy coast to the northeast, drained by means of two large reclamation trenches. The city was surrounded by a fortification wall, perhaps preceded by a moat, attested for certain at the end of the fifth century to the beginning of the fourth. Special finds are connected to the fortifications, that evidence how the boundaries of the city would have been realized following an inauguration ritual, comparable to that reported in the tradition as the *Etrusca Disciplina* (see chapter 18 Maras). At the foot of the wall runs a narrow canal that has been proposed to be identified with the *sulcus primigenius*. Not far away, a well was dug in which a jug connected with a ritual offering was deposited; beyond an empty space, some 37.5 m from the wall, a sort of cippus marks the edge of what is probably the *pomerium*.

The urban space is organized on a rectangular plan *per strigas*, like that of nearby Poseidonia. The plan provides blocks all the same size (ca. 46 × 275 m), which take two rows of residential lots, with rectangular dwellings that occupy a small part of the lot, with the rest serving as courtyards and gardens.

Carrying out the new urban plan through the division into lots required the definition of a new view of property, within the ambit of a program that also included a new organization of agrarian land. An operation of this scope implies a radical renewal of the community’s political equilibrium, carried out in the sphere of an ideological construction that enhances the value of the ethnic paradigm of “Etruscanness.” In addition to the foundation rituals connected with defining the boundaries of the city, is indicative the recovery of the aforementioned dedication to the Etruscan *Manth*—who seems to be substituted for the Greek Apollo at the moment of the settlement’s urban refounding—in the sanctuary of the public area.³⁶⁵⁵ The city name *Tyrseta* may also date to this period. Transmitted by Philistus (*FGrHist* 556, F 42) and formed on the ethnonym of the *Tyrrhenoi/Tyrsenoi*, it is perhaps attributed to the renewed urban entity of Pontecagnano or Fratte, and the notion of *Tyrsenikos Kolpos* included in Sophocles’ *Triptolemos* of 468 (F 598 Radt).³⁶⁵⁶

This was the moment of the greatest diffusion of Etruscan writing, attested in the necropolises of Pontecagnano, especially with epigraphs marking ownership of vases, but also by a vase dedication to *Turan*, the Etruscan goddess assimilated to the Greek Aphrodite.³⁶⁵⁷ The onomastic repertoire documents the widespread use of the gentilic name, which designates the independent family and marks the status of citizen with full rights. This, actually, is the prerogative of adults, while children bear only the individual name.

Etruscan inscriptions of this period also come from Eboli, confirming the cultural and linguistic scene of reference of the southern portion of the Agro

4Samnite Tyrrhenia (fifth–fourth centuries)

The years straddling the sixth and fifth centuries also brought great changes on the southern shores of the Bay of Naples and the inland plain. Vase inscriptions appear in a language similar to Samnite using an Etruscan alphabet; in short time epigraphic evidence written in the earlier Italic dialect in the “Nucerian” alphabet runs out.

This phenomenon has been connected with an early Samnite penetration into the territory, triggered by the great expedition of Etruscans and barbarians against Cumae in 524 (Dion. Hal. *Ant. Rom.* 7.3.1).³⁶⁵⁹ Other than in the vase inscriptions, the use of Oscan is well known in the city names Nola³⁶⁶⁰ and Nuceria (*Noukeria*), which mark the two centers as “new cities,” as was also the case for the nearby Greek foundation of Neapolis. The new names mark the qualitative leap with respect to the previous community arrangement, in the case of Nuceria probably based on the institution of the *touta*, evidencing the renewed ethnic connotations of the two cities by means of the language.

In the new context, the role of the Etruscans became marginal, further diminished on the Tyrrhenian backdrop by the defeat of the coastal Etrurian cities in the second battle of Cumae in 474 (Diod. Sic. 11.51). The resulting situation is symbolically reflected in the *Periplus* of Pseudo-Scylax (*GGM* 1.19–20), which dates to between the late fifth and mid fourth centuries, and which does not register an Etruscan presence on the coasts of Campania. Instead, it calls the people settled between the Lucanians (of Poseidonia) and the Campanians (of Neapolis and Cumae) “Samnites.”

On the southern shores of the Bay of Naples the presence of etruscophones is documented at least until the late fourth century by inscriptions from Pompeii and Vico Equense, but by now the linguistic and cultural context is fully samnitized.

The situation in the Gulf of Salerno is clearer. The collapse of the Archaic period system of exchange produced a gradual reorganization of Fratte, whose center seems to revive only in the mid fourth century, when lavish reconstruction overtook the quarter of the acropolis and the related sanctuary. The cult of Heracles was resurrected as a reference in the construction of the political identity of the samnitized community, hinged on a limited aristocratic group that used chamber tombs below the sanctuary. The presence of the burials on the acropolis marks a discontinuity with respect to the previous settlement plan, which integrated a widespread system of farmsteads into the territory.³⁶⁶¹

At Pontecagnano, the process of “samnitization” affected a still vital community at the end of the fifth century. The most obvious sign of change is

found in the necropolises, where there appear burials of soldiers in the southern Italic custom, featuring the spearhead that is often associated with the bronze belt and, in exceptional cases, featuring the three-disc cuirass. In the last decades of the fifth century, there are limited funerary groups known, many of which are in areas never previously utilized for funerary purposes, but which are still accessible from the suburban road network. Their positioning around the inhabited area evidences the preservation of the previous urban plan, confirmed by the restoration of the fortifications, the continuity of use of the public area and the sanctuaries, and the maintenance of the urban blocks notwithstanding the reconstruction that assailed the individual plots. A significant sign of continuity consists of the preservation of the Etruscan language, documented by many inscriptions until the middle or third quarter of the fourth century, as opposed to the few inscriptions in Greek language or script attributable to the new arrivals.

It may be this continuity that contributed to the preservation of the ethnic name, if the *Tyrrhenoi* came from the Agro Picentino, and who—together with the Lucanians and Brettians—went as a delegation to Alexander in Babylonia in 323 (Arr. *Anab.* 7.15.4), and were responsible, along with the Romans, for the barbarization of Poseidonia in the lament of Aristoxenus (F. 124 Wehrli).³⁶⁶² Referring to a similar context, attributed to Pontecagnano or the Agro Picentino are the Etruscan pirate Postumius, who in 339/338 offered his services to Timoleon (Diod. Sic. 16.82.3), and the mercenaries who in the same period struck bronze coins in Sicily with the legend *Tyrrhe(non)*.³⁶⁶³

The fate of Samnite *Tyrrhenia* was sealed with the arrival of the Romans, which for the Agro Picentino was full of consequences. Beginning at the end of the fourth century to the beginning of the third, the centers of Fratte and Pontecagnano show clear signs of a crisis that culminated with their final destruction around the middle of the third century, indicated in the built-up areas by the choking of the wells with building materials, ceramic fragments, and detritus of daily life.”. The event finds a symbolic representation at Pontecagnano, where the closing of the two sanctuaries involves the demolition of the buildings and the celebration of appropriate rites of expiation.³⁶⁶⁴

74Northern Campania

Abstract: The northern part of Campania offers the main “body of evidence” about the presence of Etruscan civilization outside Etruria. Literary sources, epigraphic data and archaeological discoveries confirm that the Etruscans in the region developed an advanced urban civilization, and from the late tenth century BCE onward founded several cities around Mount Vesuvius, while never reaching the coast. Capua and Nola were the main centers of Etruscan Campania. The former, according to ancient written sources, was the capital of a *dodecapolis* (a confederation of twelve cities). The results of a deep cultural and ethnic interaction between the Etruscans and the indigenous peoples, the Opikoi and the Ausones, gave birth in northern Campania to a mixed civilization, which included the entire *mesogaia*, the fertile hinterland. In the fifth century BCE, the Etruscan cities of Campania were captured by the Campanians.

Keywords: Etruscans, Italic peoples, Capua, *Fossakultur*, *mesogaia*

1Land and people in northern Campania according to the ancient authors

The great German scholar Julius Beloch opened his famed book on ancient Campania with the following sentence: “Campanien hat nie ein politisches Ganzes gebildet.”³⁶⁶⁵ This introductory remark well summarizes the complex reality of ancient Campania³⁶⁶⁶ and fits perfectly with our purpose of introducing an archaeological synthesis on the presence of the Etruscans in this important region of ancient Italy, and in particular in the northern part of it.

The northern part of this region consists of a large territory encircling from northwest to southeast the so-called crater—that is, the fertile central Campanian plain between Cape Miseno and Cape Ateneo (Fig. 73.1)³⁶⁶⁷. This region is basically flat, but is embraced by some small groups of mountains—the Gauro, the Falerno and the Massico, which give the region natural “protection” without being a barrier. The natural boundaries of the region can be considered the Garigliano River to the north, the Samnite Appennines to the east, the Nocera Mounts and the Sorrentine peninsula to the south, and the Tyrrhenian Sea to the west. The ancient sources also make a clear distinction between the hinterland (*mesogaia*) and the coast (*paralia*) (Polyb. 3.9.2; Strabo 5.4.3). The *mesogaia*, in particular, ties up to the west the area known as the “Phlegraean Fields,” which, together with the islands of Procida and Ischia, forms a geographical unit. From a geographical point of view there is

no clear frontier between Latium and Campania and the two regions can be considered strictly linked to each other by means of an ancient route of connection traced in historical times by the Via Latina.

The region was famed in antiquity for the abundance of natural resources and for the flourishing economic activities.³⁶⁶⁸

As to the population, the written sources (Antiochus *apud* Strabo 5.4.3; Livy 4.37; Polyb. 2.17; Plin. *HN* 3.60) distinguish two different groups of populations in Campania: the “invaders” (the Greeks, Etruscans, Samnites and Romans), and the native populations (the Opikoi and Ausones).³⁶⁶⁹ The Opikoi in particular are described as the native populations settled in the vast area placed around the Vesuvius volcano, up to the coast, where they are installed at the site, Cumae, which was selected for occupation by the Greek colonists from Euboea.³⁶⁷⁰

The Ausones are considered by the classical authors (Ael. *VH* 9.16) the most ancient indigenous population of Campania.³⁶⁷¹ Even though some cities of the *mesogaia*, like Nola, are described by some authorities as Ausonian foundations,³⁶⁷² it is generally accepted that the Ausones had settled in historical times only in the northern part of Campania, close to the Latium vetus while in Roman times the presence of the Aurunci is registered.

Within this interesting ethnic framework depicted by the ancient authors, it is worth noting that at the beginning there is no mention of Tyrrhenians/Etruscans in the northern Campania, since our principle source of information for sixth century Italy—the Milesian Ecatarch’s account, which was based on the information given to him by traders and mariners of Ionia—presents the main site of the region, Capua (corresponding to the modern city of Santa Maria Capua Vetere),³⁶⁷³ as a *polis Italica* instead of a Tyrrhenian foundation.³⁶⁷⁴

Very different is the perspective outlined by the Greek and Roman authors of the third to first centuries BCE and of the Roman Imperial period, who emphasize the Etruscan domination in Campania and focus on the leading role of Capua and Nola, whose foundation by the Etruscans, according to Marcus Velleius Paterculus (1.7), would date back to the age of Hesiod.³⁶⁷⁵

Velleius, however, also registers an opposite hypothesis on the foundation of Capua (and Nola) referring to old Cato’s proposal to date this event 260 years before the Roman conquest of the city. Modern commentators have offered different interpretations of this ancient dispute, speculating about the time and the date of the two alleged Etruscan foundations of the city,³⁶⁷⁶ which have seemed necessary to some scholars not to refute Cato’s authority.³⁶⁷⁷

The Etruscan cities of northern Campania, finally, do not appear in Dionysius of Halicarnassus’ account (7.3.1) of the Etruscan expedition against the Greek city of Cumae (524 BCE). He mentions neither Capua nor the other Etruscan cities in the region. The invaders were Etruscans coming from the Adriatic coast, mixed with Italic bands of Piceni and Dauni.³⁶⁷⁸ It is probably

the symptom of a vast process of geographic mobility from north to the south affecting the Italic world.³⁶⁷⁹ What is clear is that after this event, the archaeological record documents the extraordinary flourishing of Capua (phase VI in Werner Johannowsky’s periodization), which will last after a very short time because of the Samnite conquest.³⁶⁸⁰

2Previous research and history of studies

Julius Beloch, Jacques Heurgon and Martin Frederiksen can be considered the forerunners of modern research on the Etruscans in northern Campania, and in particular at Capua.³⁶⁸¹ They have provided large historical synthesis on this matter and have contributed their observations as the foundations for future discussion. More recently, Johannowsky’s contribution to archaeological research in this area has been enormous.³⁶⁸² His periodization of ancient Capua’s cultural development³⁶⁸³ is still in use. He has distinguished six phases and several sub-phases (Table 1):

Table 1: W. Johannowsky’s periodization of Capua

Phase IA	Phase IB	Phase IIA	Phase IIB	Phase IIC	Phase IIIA	Phase IIIB	Phase IVA	Phase IVB	Phase IVC	Phase V	Phase VI
900– 850	850– 800	800– 775	775– 750	750– 725	725– 670	670– 640	640– 625	625– 590	590– 570	570– 525	525– 426

Phase IA	Phase IB	Phase IIA	Phase IIB	Phase IIC	Phase IIIA	Phase IIIB	Phase IVA	Phase IVB	Phase IVC	Phase V	Phase VI
900– 850	850– 800	800– 775	775– 750	750– 725	725– 670	670– 640	640– 625	625– 590	590– 570	570– 525	525– 426

In recent times, many works have been devoted to the Etruscans in Campania.³⁶⁸⁴ Short syntheses on this subject have also been published within works dealing with more general topics, like Etruscan civilization³⁶⁸⁵ or the Etruscan collections in important European Museums.³⁶⁸⁶ The enormous bulk of information from the postwar period can be found within the proceedings of the four conferences devoted to the Campanian region held by the Institute of Etruscan Studies.³⁶⁸⁷ Furthermore, a lot of particular studies have been devoted to different matters: among them we mention the publications on Etrusco-Campanian artistic production, and in particular on the ceramic and terracotta production referable to ancient Capua, which are already available or are being realized in the framework of the Series “Capua preromana.”³⁶⁸⁸ Finally, worthy of mention are the publications on the history of research, which deal mainly with the sites of Capua and Nola.³⁶⁸⁹

3The main center of the region: Capua

3.1The Iron Age (Phases I–II: 900–725 BCE)

Along with Pontecagnano, Capua is the main Etruscan center of Campania.³⁶⁹⁰ According to Strabo (5.4.2) the city was the capital of an Etruscan *dodecapolis* similar to that of proper Etruria described in the written sources, even though there is reason to believe that this information does not exactly correspond to the real political organization of the region during the Archaic period.³⁶⁹¹

Like other Etruscan and Campanian centers, there is virtually no evidence of occupation at Capua prior of the late Bronze Age/Early Iron Age.³⁶⁹² It has been suggested in the past that the site was settled by Etruscan groups coming from the Tiber region around the late tenth century,³⁶⁹³ but the picture emerging both from the literature and the archaeological evidence clearly suggests that since its first appearance, Capua's Etruscan identity is very distinctive and originates from a deep network of contacts between the Etruscan newcomers and the native populations.³⁶⁹⁴

Systematic excavations have been undertaken on several sites and large areas used as cemeteries have been found in Località Cappuccini, Nuovo Mattatoio, Fornaci and Quattordici Ponti³⁶⁹⁵ (Fig. 74.1). A small strip of the Early Iron Age settlement (remnants of huts) attributable to the first phase of Johannowsky's periodization has been unearthed northwest of the modern village of S. Maria Capua Vetere, not far from the Nuovo Mattatoio necropolis.³⁶⁹⁶

The first phase of Capua's history (IA: 900–850 BC) has been for a long time a matter of discussion, known by only the small group of sporadic bronze fibulae kept in the storerooms of Museo Campano and by the exceptional evidence of the tomb 1 of S. Angelo in Formis' necropolis, which contained proto-Villanovan type vases.³⁶⁹⁷ Due to this lack of archaeological evidence, previous debate focused on the few and problematic facts described by the written sources (in particular those containing toponomastic data)³⁶⁹⁸ and speculated on a potentially dangerous *argumentum ex silentio*—that is, the absence within Capua's domestic Iron Age repertoire of the Etruscan “index fossil” of biconical urn.³⁶⁹⁹ Despite the large success encountered by Giovanni Colonna's authoritative proposal to identify ethnic elements coming from the Faliscan center of Capena and from the Etruscan city of Veii among the “Etruscan” conquerors of Terra di Lavoro,³⁷⁰⁰ it has been recently argued that the Villanovan center of Capua would not have differed from the south-Etruscan Villanovan mani festations³⁷⁰¹. At the origins of the settlement there would be the arrival from Etruria of human groups searching for new territories.³⁷⁰² Thanks to Gianluca Melandri's recent book on Capua's Iron Age, our knowledge of this subject is now enormously augmented³⁷⁰³. He has

in order to make room for a hybrid culture.³⁷⁰⁴

Capua's main Iron Age cemeteries are located northwest of the ancient urban area. From phase IB onwards, inhumation became the predominant funerary rite. Weapons are very rare in the male burials of this period, but the social and gender distinctions are always clearly detectable thanks to the presence or absence of some archaeological markers (razors for men; domestic instruments and ornaments for women). In the situation of generalized uniformity, at Capua there are some Iron Age graves that stand out because of their exceptional typology and the quality of their contents. Among these, it is particularly worth mentioning the Nuovo Mattatoio 1 tomb, an exceptional tumulus grave dated to the middle of ninth century containing a set of clay vases (Fig. 74.2), a small group of exotic vessels and luxury goods, and the ashes of an incinerated warrior buried together with his sword.³⁷⁰⁵ Facing such an extraordinary grave and its particular position (it lies near the Volturno River at the core of a cemetery area which is organized around the tumulus itself), it is difficult to avoid the impression that it is the tomb of an eminent member of Capua's Iron Age community, a sort of *oikistes* coming from abroad.³⁷⁰⁶

As happens elsewhere in southern and central Italy, at the turning point of the ninth century (where Johannowsky dates the beginning of the second phase), in the richest graves of Capua appear the first Greek geometric vases in meaningful number.³⁷⁰⁷ They are drinking pots manufactured in the middle geometric style in Euboea, Attica and in the Cyclades, whose large diffusion in the western Mediterranean indicates the efforts of the Greeks to set up a network of permanent contacts with ancient Italy's native populations after the "dark age."³⁷⁰⁸ In the same time, the entire northern Campanian region is affected by a vast phenomenon of the circulation of *orientalia*, *aegyptiaca* and carved amber, which are finally put in the tombs of women and children with the function of amulets.³⁷⁰⁹

Among the tombs dating to the end of the eighth century, perhaps to be assigned already to phase IIIA, special attention is due to tomb 722 at Fornaci.³⁷¹⁰ It is a rich fossa grave dated to the second half of the century, where the rite of cremation is exceptionally applied to a woman whose ashes were put into an impasto "zero" (large jar) dressed at the center of the ditch. The grave goods contain a rich set of personal ornaments, some impasto vases, a drinking-service imported from Pithekoussai and a little sculpture made of bone representing a naked woman, who reminds us of the so-called "Goddess" of Marsiliana d'Albegna. The furniture also includes a rare Phoenician silver hemispherical cup with scale decoration under the rim (Fig. 74.3), similar to those founded at Caere and Praeneste. This context is worth noting because it represents the anticipation of a cultural phenomenon, the princely tombs of the Orientalizing Period, which wasn't attested at Capua so far. According to Johannowsky, tomb 722 at Fornaci was the tomb of a Greek (Pithecan) noblewoman living at Capua.³⁷¹¹

Fig. 74.2: Capua: impasto vases and bronze ornaments from tomb Nuovo Mattatoio I (photo O. Fabozzi, courtesy G. Melandri)

3.2 The Orientalizing Period (phases IIIA–IVC: 725–570 BCE)

The first part of the Orientalizing Period at Capua, according to excavators, is not as rich as elsewhere in central and southern Italy.³⁷¹² Capua's material culture attributable to this period and the level of prosperousness of the community as it is reflected from importations and local productions—suggest indeed a downturn of external trade and commerce and the starting of a phase of “provincialism” and isolation.³⁷¹³

The vessel repertoire in this phase is dominated by the brown Impasto, the local conservative ware representing the continuity of local tradition against the cultural pressure exerted in the sphere of ceramic fashion by the Greek-type ceramics.³⁷¹⁴ It is the “national” ware of the Opikoi, widespread everywhere in northern and inner Campania, representing the more explicit mark of the *Fossakultur koiné*. Nonetheless, we can find in the impasto repertoire of northern Campania a great variety of drinking vessels directly derived from Greek prototypes—in particular oinochoai, kotylai, and skyphoi.³⁷¹⁵ The decorations reveal a “provincial” taste. Besides this impasto tableware, at Capua and elsewhere, the so-called Italo-geometric ware—that is, the interesting Greek-type class of pottery of derivative origin, which imitates the proto-Corinthian sub-geometric style—is well documented during the Orientalizing Period.³⁷¹⁶

Fig. 74.3: Capua: silver cup from tomb Fornaci 722. Santa Maria Capua Vetere, Archaeological Museum (after Allegro et al. 1995)

In phase IV of Johannowsky's periodization bucchero ware predominates at Capua. After a short period (phase IV A), during which the supply of this class of pottery is assured by means of importation from southern Etruria, local workshops begin producing bucchero vases, in terms of mass-production, at the beginning of the sixth century³⁷¹⁷. In this period, the whole northern Campanian district adopts bucchero as the main tableware. Although this fact has been considered an "ethnic marker,"³⁷¹⁸ it is actually important to say that the fortune of the bucchero outside Etruria is a feature that affects several regions of central Italy involved in a vast process of acculturation that led to the adoption of this category of Etruscan-type tableware.³⁷¹⁹ An interesting small group of Campanian bucheri has also come to light also at Cumae.³⁷²⁰

As to corinthianizing pottery, workshops working in the tradition of southern Etruria are established at Capua and perhaps elsewhere (Suessula, Calatia and Nola) in order to supply the growing local demand. According to Johannowsky,³⁷²¹ Capua's Etrusco-(proto)Corinthian production included small containers of perfumed oil produced *in loco*, which were exported both to the Greek colonies of the coast (Cumae, Pithekoussai and Parthenope),³⁷²² and to the indigenous Sarno Valley district.³⁷²³ On the other hand, this Etrusco-Corinthian production of northern Campania doesn't include any figural vases. This feature indicates that as far as corinthianizing pottery is concerned, Capua's case study differs greatly from that of Pontecagnano. At the Etruscan colony at the Picentino River's mouth there was an interesting local production of figure-vases imitating Corinthian models.³⁷²⁴

Also attested at Capua are small quantities of east-Greek vases³⁷²⁵ and large numbers of Corinthian figure-vases, oinochoai, olpai, kotylai and perfume-flasks,³⁷²⁶ which reached the region *en masse* beginning at the end of the seventh century. The most spectacular items of this series of importations find themselves inside some rich late-Orientalizing *cubo*-type graves,³⁷²⁷ tufa

block tombs shaped like stone cubes holding cremation materials. These exceptional complexes, as tombs 1504 and 1505 at Fornaci, along with the Corinthian clay imports, also contain elaborate Greek bronze vases ended up at Capua from the coasts of northern Campania probably via Cumae. That Greek colony seems to have been the terminal of a commercial network that linked the Ionian coast of southern Italy to the coasts of Campania (the Sorrentine Peninsula).³⁷²⁸

These Greek bronze vases of Peloponnesian (often Laconian) craftsmanship were particularly appreciated by Capua's elite.³⁷²⁹ They include sets of wine vases, including both large liquid containers (kraters and hydriae) and pouring vases (oinochoai/pitchers), which sometimes occur at Capua along with large basins with decorated handles of a type now also documented in northern Basilicata.³⁷³⁰

The most spectacular concentration of these exotic goods in Capua is to be found in a princely tomb known as the Dutuit Tomb or Quattordici Ponti Tomb, which is yet to be dated at the dawn of the Archaic Period (phase IVC).³⁷³¹

It is a pseudo-chamber grave that was excavated in 1873 in the Quattordici Ponti necropolis. The extraordinary contents of the tomb were sold worldwide through the intermediation of the German scholar Wolfgang Helbig, whose intense activity in the contemporary art market has been recently reconstructed in detail.³⁷³² The tomb contained astonishing funerary furnishings: an iron axe, some east-Greek plastic vases, Corinthian *alabastra* of the so called *Luxus-group*, a rich set of Greek and Etruscan bronzes including a rare *infundibulum*, some basins with plastic human heads, a large basin with handles decorated with horse heads manufactured in a southern Etruscan workshop—perhaps Vulci—and a masterpiece of the contemporary Etruscan bronze industry, the revetment plaques of a chariot decorated *au repoussé* with chimaera figures.³⁷³³ Some of these objects are missing;³⁷³⁴ other items are on display at various archaeological museums where they ended up at the time of the discovery through the complex net of the art market.³⁷³⁵ Because of the emphasis placed on the status symbols that the tomb contained—as for instance the *currus* and the axe—the Quattordici Ponti complex has been interpreted as the tomb of a local chiefdom controlling the stream of “international” traffic, which reached the Campanian coasts via Cuma.³⁷³⁶

3.3The Archaic Period (570–470 BCE)

We know very little of Capua in the Archaic Period.³⁷³⁷ Recent excavations have revealed the existence of the remains of stone and mud brick houses in the eastern part of the city, in the Siepone area, close to the “Furnace” area (Fig. 74.4).³⁷³⁸ They display regular plans and are equipped with architectural

roof decorations. Not far from this site, not many years ago, the Superintendency had explored another small part of the archaic settlement in the Alveo Marotta area, near the San Prisco bridge, which has been interpreted by excavators as a *pagus* inhabited since the beginnings of sixth century and abandoned around 470.³⁷³⁹ Among the buildings explored, besides stone and mud brick houses, there is also an interesting kiln with a rectangular plan for the production of pan tiles.³⁷⁴⁰ It is interesting to note that a small group of inscribed pot sherds come from this area that enlarge our knowledge of the diffusion of Etruscan literacy at Capua during the late archaic period.³⁷⁴¹

In this period—phase VI of Johannowsky’s periodization—we note an interesting cultural phenomenon at Capua, the marked Hellenization of the customs of the urban elite.³⁷⁴² After a period of relative “indifference” for the Capuan market, the flourishing commerce of Athenian figure-vases along the Tyrrhenian coasts reached the Etrusco-Campanian city and the other urban centers of the hinterland (in particular Nola). The massive importation of Attic red-figure vases reflects the tastes and the active choices of the purchasers, which is particularly evident in the selection of the shape vases and the request of particular images.³⁷⁴³

Our principal source of information for this period is the Fornaci necropolis,³⁷⁴⁴ but a lot of cemeteries dating to this period have been discovered both to the north and to the south of the ancient settlement.

Two tombs crucial to Capua’s history that are dated to this period are the Lebate Barone’s Tomb and the Brygos Tomb. The latter was unearthed in 1870s by Simmaco Doria in the Quattro Santi necropolis, along the road leading from Santa Maria Capua Vetere to the Tifata Mount.³⁷⁴⁵ It included half a dozen of exceptional Attic red-figured vases, among which stand out a skyphos signed by the potter Hieron and attributed to the painter Makron. It also included a kylix attributed to Brygos.³⁷⁴⁶ The complex has been interpreted by Dyfri Williams as the tomb of an Athenian buried at Capua,³⁷⁴⁷ but Luca Cerchiali is probably right in arguing that the tomb reflects an ideological system of the local aristocracy, which seems proper.³⁷⁴⁸ Recently, Sabrina Batino speculated about the social identity of the deceased and tried to demonstrate that he was a young Capuan *hippeus* dead before reaching adulthood.³⁷⁴⁹

The tomb containing the famed Lebate Barone was unearthed in 1847 in the village of Sant’Erasmo. Associated with the bronze vase were at least two Attic figure-vases, a red-figure kylix attributed to Euergides, and a black-figure Panathenaic type amphora painted by the Diosphos Painter. It has been argued that this association of the bronze lebes and the Attic black-figure amphora of the (pseudo-)Panathenaic type occurs frequently at Capua and is particularly meaningful, because it refers to the values of the athletics.³⁷⁵⁰

Fig. 74.4: Capua: plan of the archaic buildings found in the 'Siepone' area (courtesy V. Sampaolo)

As for monumental art, it is worth mentioning the only Archaic painted tomb ever found at Capua. The painting, which depicts a scene of table-game (draughts), is dated to around 470.³⁷⁵¹ The rare iconographic subject might refer to the urban reorganization of Capua, which is alluded by the old Cato's sentence reported by Velleius (1.7). It is probably at this time that the city's oligarchic elite selected a new city name—Volsturnum—to reinforce and legitimize the political order.³⁷⁵²

4Sanctuaries: the Fondo Patturelli

Although the sanctuary of Diana Tifatina, on the slopes of Tifata Mount, seems to have been the most important sanctuary of ancient Capua according to ancient authors,³⁷⁵³ there is not the slightest doubt that our knowledge of Archaic Capua's sanctuaries is essentially based on the overwhelming archaeological evidence from the Fondo Patturelli area.³⁷⁵⁴ This sacred area, located on the east side of the ancient settlement, in the modern village of Curti, has yielded a huge quantity of architectural and votive terracottas. Besides the votive materials,³⁷⁵⁵ the so-called *matres matutae*, massive statues carved in the local tufa representing seated women with children on their laps

stand out from the other anonymous *ex-votos* (Fig. 74.5).³⁷⁵⁶ The iconography raises the question of whether the women are goddesses or humans. Whatever the case, their characterization as *kourothrophoi* suggests that the cult was devoted to a goddess protecting women and the sphere of birth. A possible candidate would be Uni, an important goddess of the Etruscan *pantheon* corresponding to Iuno/Hera, mentioned also in the so called *Tabula Capuana* (Fig. 35.6),³⁷⁵⁷ a ritual calendar inscribed on a terracotta tile that was discovered in the nineteenth century (see Section 5). Some scholars think that due to the proximity of the sanctuary to a cemetery, a goddess like a funerary Aphrodite is more appropriate.³⁷⁵⁸ Recent excavations have, however, demonstrated that there was no close relationship between the sanctuary and the cemetery before Roman times.³⁷⁵⁹ Moreover, there is no proof that the *Tabula Capuana* was found in the area of Fondo Patturelli. On the contrary, the contemporary archival documents studied by Mauro Cristofani³⁷⁶⁰ suggest that it was discovered at Quattordici Ponti.

In order to determine the cult—or, to a lesser degree, the cult typology—in addition to the *matres matutae*, we must rely mainly on the thousands of terracotta *ex-votos* scattered in the area, on the later Italic (Oscan) inscriptions known as *iovilai*³⁷⁶¹ and the *defictiones* written in the same language coming from the sanctuary area.³⁷⁶²

Fig. 74.5: Capua: Stone statue of seated woman. Capua, Museo Provinciale Campano (after *Italia omnium terrarum alumna*, Milan 1989)

Alessia Ventriglia has recently stressed the importance of Vei, the Etruscan Demeter, within the *pantheon* of the Fondo Patturelli, which probably also includes other goddesses, like Uni.³⁷⁶³

In addition to this evidence, of great importance for determining the Fondo Patturelli cult are also particular objects coming from the *favissae* of the sanctuary, like the terracotta relief recently published by Barbara Grassi,³⁷⁶⁴ and the “magic” clay disk displaying various symbols in low relief on the recto studied by Lidia Falcone,³⁷⁶⁵ which shows signs of syncretistic tendencies.

It seems likely that throughout its life, the sanctuary hosted different shrines and several sacred buildings decorated with architectural terracottas of different style and size, which suggest that the sacred area included a sort of *lucus* scattered with small aedicules which were, perhaps, managed by different families.³⁷⁶⁶ The huge quantity of decorative terracottas discovered in the Fondo Patturelli needs a brief supplementary comment. In the sanctuary have been brought to light hundreds of architectural Campanian-type terracottas. They form an unique data-set which allows us to identify the revetment system adopted by the habitants of Capua for the roofs of their main temples.³⁷⁶⁷ The standard Campanian system includes a characteristic type of head-antefixes encircled by a shell of tongues with molded edges (*nimbus*) (Fig. 74.6). The origin of this roofing system has been long disputed, and an east-Greek influence via Velia has been argued by different scholars³⁷⁶⁸ to explain the regional distribution of the Campanian-type antefix. However, as has been demonstrated,³⁷⁶⁹ it is more likely that the system was created in the western Greek *milieu* of the Bay of Naples, from where it later spread to the Etruscan *mesogaia* (Capua), and where it was further developed and transmitted both to the north and the south.³⁷⁷⁰ Capua might indeed be considered the center of diffusion of a system that was originally elaborated in the Cumae/Pithekoussai district. It gives birth to an interesting phenomenon of cultural and artistic *koiné*, which, according to some scholars, even affects the politic sphere.³⁷⁷¹ Capua's influence would have reached Minturno to the north and Fratte to the south, drawing the boundaries of a sphere of influence that would greatly overpass the limits of the alleged Etrusco-Campanian league mentioned by Strabo in Roman times (see Introduction).

Fig. 74.6: Capua: Antefix decorated with female head. Capua, Museo Provinciale Campano (after Johannowsky 1989)

5Campanian black-figure vases, bronze dinoi and terracotta appliques

According to Johannowsky, the Archaic Period is the most original period of Capua's history in terms of its artistic production.³⁷⁷² Scholars have identified several local workshops operating in the tradition of Attic and Etruscan black-figure vases.³⁷⁷³ The massive output of these workshops includes mainly tableware, including small neck-amphorae (Fig. 74.7), hydriae and colonnette-kraters, and open Greek-type shapes (stem and stemless kylikes, and mastoid cups). As for iconography, recent studies have demonstrated that the images depicted on these vases can be divided into two different groups: one that refers to the male sphere, the other to the female.³⁷⁷⁴ Some items, furthermore, seem to give a lot of importance to cult scenes where play an important role the representations of rites that happen near altars and altar-like buildings.³⁷⁷⁵

Campanian workshops were also famed in the Archaic Period for the selected production of a class of elegant bronze vases equipped with lids and

decorated with small sculptures cast in the round (Fig. 74.8).³⁷⁷⁶ They are large *lebetes* (or, according to another denomination, *dinoi*), which were exclusively used as ash-urns in the *cubo* tombs, attested in Etruscanized Campania since the seventh century.³⁷⁷⁷ Outside Capua, specimens are recorded from Cumae, Calatia and Suessula, but surprisingly, two items seem to have reached also central Italy³⁷⁷⁸ and perhaps the remote modern-day Germany.³⁷⁷⁹

Fig. 74.7: Campanian black-figure amphora. Siena, Archaeological Museum (Photo SAT)

Fig. 74.8: Campanian bronze dinos. Berlin, Antikensammlung (after Kästner 2010)

Fig. 74.9: Capua: terracotta appliqués. Santa Maria Capua Vetere, Archaeological Museum (after Allegro et al. 1995)

The decoration of these elegant vases was generally confined to the lid, but there is one relevant exception: the “Lebete Barone”, dating to the late sixth century, which displays an interesting incised frieze focusing on Herakles’ *dodekathlon* on its belly.³⁷⁸⁰

Finally, we mention the interesting series of Capuan terracotta appliques (Fig.74.9), which complete the picture of late Archaic local production. According to Fernando Gilotta, they are the result of a strong Greek influence coming from Peloponnese and East Greece via Magna Graecia.³⁷⁸¹

6Written documents and the language

Hundreds of Etruscan inscriptions have been found throughout northern Campania suggesting that Etruscan was largely spoken by the native populations.³⁷⁸² The bulk of the *corpus* is represented by short texts incised in the bottom of Attic imports (mostly stemless cups)³⁷⁸³ found at Capua, Suessula, Calatia, Nola and Avella. As a rule, these texts are brief sentences simply mentioning the owner’s name and sometimes the name of the vase-shape.³⁷⁸⁴ The *onomasticon* includes a lot of Italic names, as is to be expected in a frontier area like northern Campania,³⁷⁸⁵ a region in which—according to the picture drawn in the ancient written sources—different peoples lived

together side by side since protohistory (see Introduction). Within the *corpus* one can also find abecedaries, like the painted one on a Nolan *situla* dating to the first half of the fifth century;³⁷⁸⁶ other rare examples are datable to the sixth. A recent study has drawn attention to a class of stamnoid *ollae* with painted decorations dating to the sixth century that were probably manufactured at Capua and which sometimes carry short Etruscan painted inscriptions.³⁷⁸⁷

The *Tabula Capuana* is one of the major extant Etruscan texts (Fig. 35.5).³⁷⁸⁸ It is an archival document originally hosted in a sanctuary. The long text is incised on the surface of a pan tile that is almost entirely preserved. The text is divided into ten sections with religious prescriptions that mention several gods of the Etruscan pantheon. Particular importance is accorded to Lethams, a god also mentioned in the Piacenza liver. The monument is to be dated to the second quarter of the fifth century.

The Etruscan inscriptions from northern Campania show some original features from the epigraphic point of view, such as the use of a butterfly to mark the palato-alveolar sibilant. The Etruscan *corpus* of Nola also shows some interesting relationships with the Faliscan *milieu* regarding the rendering of the sound “F” by means of an “arrow” sign.³⁷⁸⁹

It is worth noting the late chronology of these Etruscan inscriptions from northern Campania, and comparing them to those from Pontecagnano, which date to the mid seventh century.³⁷⁹⁰ One wonders whether this discrepancy depends upon a real difference in the acquaintance with the Etruscan writing-system between northern and southern Campania, or on an accidental pattern of chronological distribution of the evidence. The lack of evidence in northern Campania had in the recent past seemed an inexplicable phenomenon due to the proximity of Greek Cumae, the city which taught the Etruscans of Etruria writing at the beginning of the seventh century.³⁷⁹¹

The late and anomalous spread of Etruscan writing system throughout northern Campania is a phenomenon that calls for an explanation. The late chronology of the *corpus* of Etruscan inscriptions found in the area under Capua’s cultural influence has been claimed in the recent past³⁷⁹² as an explanation for the so-called “second Etruscan colonization”—that is, the alleged migration that would have taken place after the first battle at Cumae. According to this point of view, new groups of Etruscan people coming from southern Etruria would have reached the Terra di Lavoro in the second part of sixth century, giving birth to a new foundation of the capital of the region, Capua. The inscriptions would represent one of the effects of their arrival, and the sign of a political and cultural prominence throughout the whole region.³⁷⁹³ This hypothesis adequately explained two related facts without forcing the archaeological evidence: the late chronology of these epigraphic documents, and the absence of similar evidence from previous periods, namely the Orientalizing Period.

In addition to this, it is worth noting the high number of abecedaries among

the Etruscan *corpus* of northern Campania and the systematic adoption—even in shorter texts—of the so-called syllabic punctuation (see [chapter 17](#) Benelli). It is generally accepted that the occurrence of these two related facts usually marks the start of the cultural phenomenon of the spread of writing.³⁷⁹⁴

On the other hand, according to some scholars, the sudden and large diffusion of Etruscan inscriptions throughout northern Campania in the late Archaic Period would only be a sign of the ripening of the ethnic self-consciousness of the region's Etruscan elite in the age of Cumae's tyrant Aristodemos.³⁷⁹⁵ Therefore, there wouldn't have been a second Etruscan colonization in Campania,³⁷⁹⁶ but a phenomenon of rediscovery of their own ethnic identity by the Etruscans of Campania. From this perspective, it would just be a coincidence that the large Etruscan-speaking population of northern Campania hadn't written anything remarkable for such a long time.

While the former interpretation is based on an *argumentum ex silentio*, the latter emphasizes the fortuitousness of discovery. Neither of the two explanations is fully convincing and it seems therefore wiser to postpone judgment and wait for new discoveries.

Whatever kind of explanatory model we adopt for this phenomenon, we can be certain that northern Campania was a frontier world where two peoples—Etruscans and Opikoi—lived together in the same settlements. A group of written texts classified as Paleo-Italic³⁷⁹⁷ suggest that the Italic component of the population used the writing in a competitive manner as to Etruscan.³⁷⁹⁸ One of these Paleo-Italic inscriptions is incised on the mouth of a Vulcian bronze *stamnos*, which shows that among Capua's urban community, since the beginning of the fifth century, there was a Sabellic-speaking elite.³⁷⁹⁹

7The final chapter of Etruscan Capua's history

According to Livy (4.37.1–2) and Diodorus Siculus (12.31), Capua was captured by the Campanians in 423. The conquest would have preceded by only two years the victorious entry of the Campanians to Cumae, and Neaples would have been the only city of this northern Campanian district not to be conquered by force. Livy, our main ancient source for these historical events,³⁸⁰⁰ describes the seizure of the Etruscan Capua as a phenomenon of social contrast between the urban population and the country people, which resulted in the rebellion of the latter against the former.³⁸⁰¹ This event also led to the replacement of the Etruscan city name, *Volturnum*, with the Italic name, Capua.³⁸⁰² When considered in relation to recent archaeological discoveries, Livy's account seems a little imprecise, for it has been convincingly argued by Valeria Sampaolo that the "Samnitization" of the region was a phenomenon starting as early as the beginning of the fifth century.³⁸⁰³ Thus the abandonment of the site of Alveo Marotta, to the east of the ancient city, wouldn't be the result of an ongoing process of urbanization leading to the fusion of various *pagi*³⁸⁰⁴ but the upshot of the Campanian military advance from east to west.

During the fifth and fourth centuries, Capua continued to be the center of the region's cultural development and expressed its originality by developing an important artistic tradition in vase and wall painting.³⁸⁰⁵ In 338, it was finally romanized and obtained the *civitas sine suffragio*.

8The northern part of “Terra di Lavoro”: Cales and Teano

As noted in the Introduction, the ancient sources distinguish an Ausonian district in northern Campania, the main centers of which were probably Cales and Teano.³⁸⁰⁶ As Johannowsky suggested, the local communities living in this area shared the use of characteristic tableware with the people of the Liri Valley. This was the so-called red bucchero, a ware coated with a red slip vaguely resembling the Etruscan black bucchero.

Thanks to recent research, it is now possible to trace the history of this vast region crossed both longitudinally and transversally by important axes of communication that linked Latium to the northern part of Campania directly.³⁸⁰⁷ Furthermore, three important rivers flowing from east to west—the Garigliano, the Savone and the Volturno—represent important regional landmarks. Not by chance did local people found two important sanctuaries in this frontier area, one at the mouth of the Garigliano River and another at the mouth of the Savone. The former had a temple with a roof decorated in the Campanian “manner.”³⁸⁰⁸ Of the latter only a small part of the votive deposits are known.³⁸⁰⁹

From the Garigliano sanctuary came also the famed Paleo-Italic inscription published by M. Cristofani, which clearly indicates that the cultural identity of this compound referred to the Ausones/Aurunci mentioned in the literary sources.³⁸¹⁰

Teano was the main urban center of the upper part of the Terra di Lavoro. The settlement was probably occupied since the Iron Age, as is suggested by a group of clay vases without specific provenance, which show interesting elements of comparison with the Tiber Valley region and southern Italy, particularly the Daunia.³⁸¹¹ During the Archaic age, the community invested a lot of resources building sanctuaries equipped with monumental buildings. In two of them, in Loreto and Fondo Ruozzo, important evidence of the *anathemata* and the cult statues dating at the earliest to the end of the sixth century have come to light.³⁸¹² Among them one can find clay statues representing *kourophoroi*, women carrying children on their shoulders, and cult statues of the goddess worshipped Popluna wearing a tall *polos a busta* (Fig. 74.20).³⁸¹³

Cales was an indigenous settlement to the north of Capua. Archaeological excavations undertaken in the Migliaro necropolis have revealed a rich archaeological *facies* corresponding to the Orientalizing Period³⁸¹⁴ that offers several elements of comparison, not only with the Opician hinterland of northern and central Campania, but also with the Latial and Etruscan cultures on the one hand, and the Sarno Valley *Fossakultur* on the other. In the choice

of vase-shapes, the local ceramic repertoire is indeed a hybrid; especially in the case of the table-amphorae we find side by side both shapes attested in the Hernic area and in the Sarno Valley.³⁸¹⁵

A rather exceptional context dating to the late Orientalizing Period is tomb 1.³⁸¹⁶ It is a male inhumation with very rich equipment, comprising a set of Etruscan buccheri and Etrusco-Corinthian vases imported from Caere, which compelled M. Frederiksen to propose that the owner of the tomb was an Etruscan warrior buried with all his weapons and vessels.³⁸¹⁷

The *corredo* of tomb 1 also includes an Etruscan transport amphora and an oinochoe of local craftsmanship decorated with painted circles on the body,³⁸¹⁸ which belongs to a class of Greek-type vases whose origin is still disputed.³⁸¹⁹ The high concentration of the vases of this production in the area around the centers of Suessula and Capua³⁸²⁰ indicates perhaps that we are facing a production enhanced *in loco*.

9The sites of the mesogaia: Suessula, Calatia, Nola, Avella

Apart from Capua, which was the main center of the Campanian *dodecapolis* (Polyb. 2.17; Strabo 5.4.3), almost all the urban centers encircling the Mount Vesuvius can be considered Etruscan foundations or Etruscanized indigenous cities. From both the former and the latter have come to light vases equipped with Etruscan inscriptions, which suggest that the entire hinterland was under strong political and cultural Etruscan domination.³⁸²¹

Calatia, a small city in the Campanian hinterland, today in province of Caserta, southeast of Capua, shows a strong Etruscan influence. We know very little about the ancient center, which corresponds to the modern town of Maddaloni. The ancient settlement appears encircled by walls built in the Republican period; it is flanked both to the east and the west by two large cemeteries in use from the ancient Orientalizing period onward.³⁸²²

One of the most important Orientalizing graves of the Calatia necropolis is Tomb 201. Besides the local impasto vases, it contained a group of Greek vases of Proto-Corinthian type and a ribbed bronze bowl.³⁸²³

The rich documentation dating to the seventh century and in particular to the late Orientalizing period (630/20–580) allows us to draw the picture of a flourishing small community of the Campanian *mesogaia*—highly representative of the local *Fossakultur*—as it progressively entered into the orbit of the cultural influence of Etruscan Capua.³⁸²⁴ The predominant rite is the inhumation in big “fossa;” cremation is very rare. The corpse of the dead is surrounded by a huge quantity of clay vases (drinking- and storage-vessels), placed around the head and along the sides of the body. As a rule, a large impasto container is placed at the foot of the dead, to indicate the clan’s

prosperity. The most representative contexts in this period include imported vases of Corinthian fabric,³⁸²⁵ which appear in the tombs along with local Corinthian-style imitations. Tomb 296 (Fig. 74.10) is a rare fossa-grave equipped with a small repository made out beneath the plan of the fossa. This rare grave typology has forerunners dating to the Iron Age, both in the local repertoire and in the Capua *milieu*.³⁸²⁶

Calatia's tombs have so far yielded a huge number of genuine Etrusco-Corinthian vases, both drinking-vessels and perfume-flasks, which date to the first half of the sixth century. Among these, one can find products of the workshops of Caere and Vulci, including kylikes of the Human Mask Group and alabastra of the confronted cocks group.³⁸²⁷ The most ancient Etrusco-Corinthian vases found at Calatia are a rare couple of aryballoi in black-polychrome style, attributable to the workshop of the Castellani painter. They have been considered the introductory gift of an Etruscan trader to a local aristocrat.³⁸²⁸

Fig. 74.10: Calatia: vases from tomb 296. Calatia, Archaeological Museum (after Laforgia 1996a)

Suessula is one of the main indigenous settlements of northern Campania.

The site was extensively excavated in the eighteenth century, and the majority of objects recovered in that time now form the rich Spinelli collection housed in the Archaeological Museum of Naples.³⁸²⁹ It includes hundreds of locally-crafted impasto and Italo-Corinthian vases.³⁸³⁰ A necropolis has recently been excavated in Piazza Vecchia by Elena Laforgia.³⁸³¹ From Suessula and Capua also come several giant bronze fibulae with exuberant plastic decorations applied to the disk, which date to the middle of the eighth century (Fig. 74.11).³⁸³² Even though a recent hypothesis³⁸³³ claims a possible Cumaean origin for this class of fibulae, it is more likely that these products were manufactured locally.

Nola was located at the core of Campanian *mesogaia*, along the “Etruscan” belt of settlements behind Mount Vesuvius.³⁸³⁴ The city is described as Etruscan in the late literary sources (Velleius 1.7), but Hecataeus of Miletus mentions it as a *polis Ausonon* (FGrH 1 F 61 = 69 Nenci). According to Strabo (5.4.8), the whole Campanian hinterland, including Nola, Nocera and Acerrae, had its *epineion* at Pompeii. The Etruscan ethnic noun Nulathe³⁸³⁵ indicates that the name of the city during the Etruscan domination was probably Nula. The most ancient archaeological record from Nola dates to the second half of the eighth century.³⁸³⁶

The predominant funerary rite is inhumation. The richest tombs of the Orientalizing period—112, 308 and 98—from the Torricelle necropolis (third quarter of the eighth–mid seventh centuries) were rich in amber ornaments.³⁸³⁷ The Orientalizing and Archaic cemeteries of the city³⁸³⁸ show that the material culture of Nola belongs to the *Fossakultur*. Some tombs contained remarkable importations of Corinthian, Attic and Etrusco-Corinthian styles.³⁸³⁹ Recent studies have shown that the aristocratic rite of incineration inside the krater is also attested at Nola.³⁸⁴⁰

Some of the most remarkable Campanian Etruscan inscriptions have been found at Nola.³⁸⁴¹ The texts seem not to be from earlier than the second half of the sixth century, which shows a strong parallel with the Capuan situation. The vase-shapes more often inscribed at Nola are stemless Attic kylikes; some inscriptions are to be interpreted as Paleo-Italic texts denoting the existence of a mixed population.³⁸⁴²

We have very little information about the ancient settlement of Nola.³⁸⁴³ Although there is no evidence regarding the Archaic architecture, we know about the existence of architectural terracottas of the so-called Campanian type.³⁸⁴⁴

Fig. 74.11: Capua: Bronze fibula with appliqués, Santa Maria Capua Vetere, Archaeological Museum (after Bonghi Jovino 2000)

Avella is an important Opician settlement on the left side of the Clanis River, at the foot of the hills that encircle the Campanian plain.³⁸⁴⁵ The urban center was set up at the end of the eighth century, and was surrounded by two large cemetery areas in the villages of S. Nazzaro to the west and S. Paolino to the east. During the first half of the seventh century, the community of Avella showed no signs of frequent external contacts, and the only imports found in the tombs of this period are some Italo-Geometric vases of colonial production. It is likely that the Greek colony of Cumae was also the intermediate source of the rare *Kreis- und Wellenband* aryballos found in a tomb.³⁸⁴⁶ The tombs of the late Orientalizing and Archaic periods show a greater quantity of imports. Some rich funerary complexes that date to the sixth century include, for instance, both clay and bronze vases imported from Greece and Etruria. Tomb nr. 1/1995B contained a bronze *Löwenkanne*, similar to those discovered at Capua, and a bronze *infundibulum* of Etruscan craftsmanship.³⁸⁴⁷

Besides Capua, Gricignano, Suessula, Calatia and Nola, short Etruscan inscriptions have recently been found at Avella.³⁸⁴⁸ The most important inscription is incised on an Attic black-glazed kylix with concave lip, which dates to the second quarter of the fifth century. It recalls the name of the Campanian gens of the *Calavii*.³⁸⁴⁹

VI. Etruscans outside Etruria

Central and Northern Italy

Luigi Malnati

75Emilia

Abstract: Unlike in Etruria proper during the centuries commonly referred to as the Late Bronze Age, in Emilia, there has been no success in gathering sure signs of the presence of protovillanovan culture. At the beginning of the Iron Age, the area of the high plateau between the Idice and the Reno was occupied, and later even beyond the Panaro to the west and the Santerno to the east. There were villages—some of them as large as several hectares—with necropolises of cremations in the characteristic biconical vases assignable to the Villanovan culture (for Villanova di Castenaso, near Bologna, where they were first excavated). The founding of Felsina (present-day Bologna) dates to the beginning of the eighth century BCE, and is documented especially in necropolises, which especially in the last quarter of the eighth century took on a monumental character, when Felsina assumed political control over a wide territory from Panaro in the west to Santerno in the east and ruled the plain as far as the Po. The beginning of the sixth century saw a major break at Bologna/Felsina and in Emilia, where new settlements were founded, such as Marzabotto and Spina, which flourished particularly in the fifth century. The invasions of the Celts in the fourth century disrupted this arrangement of the population.

Keywords: Etruria padana, Felsina, Marzabotto, Spina, Celts

1The origins

Unlike in Etruria proper during the centuries commonly referred to as the Late Bronze Age, in Emilia, there has been no success in gathering sure signs of the presence of protovillanovan culture, with the exception of the necropolis brought to light at various times during the nineteenth and twentieth centuries at Campo Pianelli di Bismantova, on the Appennino Reggiano. The topographic positioning of this discovery—in a strategic position below a cliff of the same name, astride the two valleys of the Secchia and the Panaro—indicates that during this period and at least as late as the tenth century BCE, the lines of communication that linked the Tyrrhenian region and the maritime district of upper Tuscany and the Po (where the protourban level center of Frattesina di Fratta Polesine was active, with its district that extended at least as far as the area of Mantua) were considered crucial. A second route is attested by a few unsystematic finds along the valley of the Reno, while much farther to the west the road that led from Lunigiana to Piacentino and on to the Po was certainly well traveled.

With the beginning of the ninth century, there was a systematic occupation of the entire upper lowland between the Idice and the Reno, and by the end of the century it had quickly spread beyond the Panaro to the west and the

Santeramo to the east. This involved villages that covered several hectares, with necropolises for cremations in characteristic biconical vessels that are easily assigned to the Villanovan culture (typical of Villanova di Castenaso, near Bologna, where they were first excavated) – that is, in the earliest period of Etruscan civilization.

The excavation of the hamlet of Fiera, which was already unsystematically explored in the 1970s, has been resumed several times in the last few years. It can thus be said that the village covered about a hectare, surrounded by a rampart and a moat. It was rectangular and oriented strictly north-south. The northern necropolis has also been investigated, although not completely, with more than 1,300 burials. It can, however, be concluded that this village, like others (ramparts and moats are also featured at San Vitale and Castelfranco Emilia), responds to political and religious planning and thus to an organizational scheme that necessitated a strong central power (Fig. 75.1).

promoted from Etruria proper. In particular, the instigator of these new foundations was supposed to be Tarchon, son or brother (in different versions of the story) of Tyrrhenus, the eponymous mythic hero, who was supposed to have led the Etruscans into Italy from Lydia.

The necropolises, which are by now very well documented, were for the earliest period used almost exclusively for cremations with very simple grave goods. The biconical urn, which follows the traditional typology of the Villanovan culture, was created specifically for burials. It has a single handle, or else it was rendered useless by having had one of the two handles broken off; it was decorated with engravings or with the technique of “falsa cordicella” with geometric motifs for the most part in wavy or serrated lines, or metope-like squares. They were covered with a one-handled lid and occasionally accompanied by a cluster of ceramics; bronze clothing accessories and personal ornaments were deposited either in the urn, often deformed by the heat of the pyre, or outside it. In general, the funerary evidence that has survived reveals a social landscape displaying little differentiation, based on family structures that were not yet organized into real *gentes*.

Some burials, however, differ from the others especially because they contain certain highly symbolic objects, such as scepters, which were found in at least two men’s tombs—182 in San Vitale, and 382 in Fiera. In all probability, these are burials of community leaders, while other signs of prestige in men’s tombs—such as arms, which are very rare in Emilia, not only in this period—indicate the heads of the principal family clans who are distinguished by valor in war. Besides, the distinction between male and female burials is assured for males by the presence of razors and pins for fastening clothes, and for females by spindle whorls and bow-shaped fibulae with a slight swell.

At the same time as the Villanovan culture was developing, the settlement of Frattesina was being abandoned, which was certainly not a coincidence; it seems likely that the Etruscan penetration north of the Apennines and the assertion of the Venetic civilization on the Adige stressed and subsequently destroyed the political center of the Polesine that had prevailed during the Late Bronze Age.³⁸⁵⁰

2The founding of Felsina

At the beginning of the eighth century, the opening of the necropolis in the Benacci land—just west of the Ravone stream in the historic heart of present-day Bologna—indicates that a village was established nearby, probably alongside an early core whose remains have been identified at Villa Cassarini, on the last hillside overlooking the city on the south. The first burials in the

Benacci necropolis, from the first half of the eighth century, do not seem to differ greatly from those of the contemporaneous necropolises of the region. In the middle of the eighth century, a transformation began that involved all the villages around Bologna and led to the founding of Felsina in a few decades. This foundation took place by a process of synoecism on the part of the inhabitants of the villages including Reno in the west, Idice in the east, the outlying hillsides in the south, and a line of villages in the north that runs between Fiera and the present locale of Castenaso. This was a highly deliberate activity on the part of a centralized political power that enfolded all the gentile elites who had meanwhile asserted themselves into a single community.

In fact, all the villages known in the area appear to have gone out of existence toward the end of the eighth century, based on information from the necropolises, and from excavations in settled areas. This holds for the villages near the gate of San Vitale, near Fiera, and those recently identified near the northeast gate of Bologna, at the Battistini barracks, and other settlements to the northwest, near the new university district and at Borgo Panigale. That the inhabitants of these villages streamed into the newly founded city is confirmed by the fact that, at least in the cases of San Vitale and Fiera, a fairly small group of burials including some prominent tombs, is still attested in the necropolises of the two villages through the end of the century. It is possible that these burials belonged to more prominent gentile families in the community, who maintained their own funerary traditions in accordance with their ancestral location, and from the religious point of view as well.

The foundation of the city has been proven archeologically by the recent excavations—in Piazza Azzarita and Piazza VIII Agosto—of structures that can be attributed to impressive fortifications of the northern boundary of Felsina, which was not determined by natural features and was exposed to attacks from potential external enemies.

It was a defensive system comprising palisades, earthen ramparts, and moats. In connection with the foundation of the ramparts, a four-handled vase for ritual use has been found and dated to the second half of the eighth century. In the same period, the western necropolis, on the Benacci and Benacci-Caprara land, was enriched with some of the most remarkable burials, such as Benacci-Caprara No. 39. This yielded a bronze cinerary urn with a rich set of warrior's equipment, including a sword and horse bits. Other burial grounds were arrayed to the north (houses of Fabbri, Arena del Sole) and east (Piazza della Mercanzia, Pepoli Palace). The burial grounds were thus arranged in a circle around the city and according to a variety of calculations, delimit it at between 150 and 200 ha. In the area between the southern hills, a line placed slightly south of Piazza VIII Agosto, west of the Aposa, and east of the Vallescura (or Ravone) stream, the inhabitants of the villages, who had settled nearby during the Early Iron Age, would gather according to a careful political plan. Presumably in the early phase, the urban

organization was not yet highly structured, with groups of buildings constructed on stakes with unbaked clay walls interspersed with free areas used for growing vegetables or keeping domestic animals. Each tribal group probably maintained its own identity and burial ground. The presence of raised burials, in the middle of a group of tombs on a lower level, seems to identify gentile groups. To this period can also be attributed the first funerary stelae—one at the Benacci-Caprara burial ground and another at the Pepoli Palace's. Both stelae appear to depict the deceased as a warrior associated with solar symbols, on a two-wheeled chariot with a pair of horses and a four-wheeled chariot respectively. It remains, then, to identify the gender of the deceased according to the associated articles of clothing, and to characterize the military activities of the men and the spinning or weaving by the women. The deposition of banquet tableware and funerary offerings characterizes the richest burials.

While Felsina was making its name in the territory, sufficiently distant from the proto-urban center smaller settlements emerged, which did not surpass the level of the village, from Casalecchio to Savignano, Castelfranco, San Giovanni in Persiceto, Castenaso, San Lazzaro, and Imola.

3The Orientalizing at Felsina

The birth of the city of Felsina also marks the achievement of a strong aristocratic class, which was already emerging in the middle of the eighth century. Around 730–720, during the period defined as Early Orientalizing in Etruria, it also appears predominant in the archaeological record.

Excavations of inhabited areas have recently proven that as early as the seventh century, an urban organization that presented characteristics of standardization must have already been active. In particular, it is possible that a north-south axis road, perpendicular to the northern fortification wall, divided the city down the middle, following the religious precepts that in Etruria were in charge of the foundation rituals. Moreover, it might foreshadow a specialization of the various urban quarters, with the southern part, against the hills, used mostly for residences, and the northern part for workshops and open space. A recently excavated building on the Via D'Azeglio shows a complicated elongated (albeit partial) plan with side-by-side rooms and a central span, approaching the gentile domicile known from Etruria proper; in the courtyard was a monumental well made with large cylinders of terracotta.

From the necropolises of this period, we have a clearer image of the great prosperity of the city, which took on a strategic role with respect to the entire Po Valley, in relations not only with Etruria, but also with the Adriatic coast, where the Villanovan center of Verucchio had taken on the function that had

been Frattesina's.

The necropolises are clearly arrayed as spokes of wheel, probably corresponding to the access roads from the city. In the western part, where the Benacci necropolis was, the topographic continuity is also especially clear in the sense that the Orientalizing period burials tend to grow farther away toward the western Arnoaldi lands. Similar indications are also clear to the east and north. Nonetheless, other necropolises originated in this period, such as the Arsenale Militare burial ground in the southeast, and those recently identified in the Via Belle Arti and the Piazza Azzarita to the north. Other burial grounds, with smaller numbers of burials, are placed in secluded, more marginal areas from the beginning (Via Tofane, Manifattura Tabacchi, Via Saffi, Via Monte Sabotino). This situation clearly corresponds to an articulated social structure with old traditional aristocratic families and *nouveaux riches*. Between the end of the eighth century and the year 600, the hierarchical composition of Felsinian society on the funerary level is evidenced by the typology of the burials, which are arranged in groups, in some cases in tumuli or circles, with the tombs of the progenitors in the center. The elevated burials are by a huge majority still cremations, although the percentage of burials increased over time. The urns in the richest tombs are in large pits with wooden cases sometimes filled with pebbles or covered by individual tumuli. During the seventh century, the method of inserting the urn with its appurtenances within a large terracotta jar came into use. The most important burials were signaled outside by *cippi* and stelae of stone, but probably also of wood. The entire display was thought of as a powerful exterior representation directed toward the world of the living. The most remarkable stone stelae, certainly belonging to very important people, are of a type peculiar to Felsina, a rectangle showing the body surmounted by a disc, perhaps to represent the head, although the decoration of the discs, when it is present, is not anthropomorphic in character, but symbolic.

The funerary equipment completes the picture, and reveals the extent of the relationships that the Felsinian aristocratic class maintained. The nature of the appurtenances displays a gender distinction, with the women always associated with weaving and spinning tools and some elements of clothing and ornament (fibulae, pendants, "*tintinnabuli*"—a sort of large axe- or bell-shaped pendant provided with a small clapper), the men with weapons and pins for fastening the cloak. In terms of social and economic stratification, there is a large variety of deposits, not only in the selectness and value of the objects included, but with the passing of time also in the quantity of ornaments, tableware, and furnishings that were "sacrificed" in the funerals. Especially that which relates to the funerary banquet anticipates the deposit of ever richer items, and with the greater power and social rank of the family, bronze objects were also often deposited, whose significance was merely to display their economic resources, keeping in mind that this metal was considered a means of payment by weight.

Objects in gold and silver (armbands, fibulae, ornaments), ivory (combs, pendants), amber (elements of necklaces, pendants), impasto (beads), locally made and imported bronze tableware (bean-decorated goblets, cups, *situlae*, *cistae*, large tablets It. *Presentatoi*, censers), fine ceramics made in Etruria or Greece (Corinthian or Etrusco-Corinthian goblets and perfume flasks; bucchero cups, jugs, and bowls) have all been found in the richest tombs. Among the locally made ceramics, those that are wheel-made, decorated with stamps and feature geometric motifs of Oriental inspiration stand out. They are widespread not only on the funerary level, and characterize the whole period.

The presence of specialized craftsmen indicates a rather advanced degree of social articulation that is typical of a developed urban center. Archaeology shows us only what concerns smiths and potters, but we can certainly imagine many other categories as well, from carpenters and woodworkers to merchants and scribes. These diverse conditions also make themselves known on the funerary level. With the seventh century, some burials, often identified as male by armaments, rather than being included in a gentilic-style grouping, are arranged separately, in rows.

This was thus by now an advanced society with an aristocracy that ruled thanks to its possession of land and livestock and its control of the commercial routes across the territory, and with emerging urban classes that that making itself known independently. This situation must have corresponded to quite a strong political power, probably a monarchy. In particular, two funerary stelae—one found by chance more than a century ago (the Zannoni stela), and one recovered more recently in the Via Tofane—seem to have belonged to two people who must have held considerable political power. Both are missing their upper part; assuming one ever existed, they would have represented the deceased on a cart drawn by a pair of horses, probably representing the journey to the hereafter, but following a pattern that clearly recalls the royal depictions that are widespread among Oriental sovereigns. It is worth noting that the Zannoni stela turns out to have used a reworked earlier gravestone depicting the Tree of Life, and to have in turn been reused as the lid of a pit grave from the end of the seventh century.

Other Orientalizing monuments from Felsina show clear Near-Eastern influence, which suggests on-the-spot activity by immigrant Syrian artists, in addition to content that is public in character with considerable symbolic significance. The “Malvasia stone” is a large monument with a heraldic composition of two bovines rampantly flanking a Tree of Life, perhaps originally mounted above an entrance (to the city?), in such a way that it could be seen from both sides. The Gozzadini head, part of a sphinx, recalls an element typical of an imposing funerary monument or a royal standard intended to be placed on a base. Two large cylindrical monoliths, originally embedded in the ground, offer moldings and symbolic decorations very obviously of Oriental derivation that were found deposited intentionally

during a ritual act within a votive pit. They have been interpreted as altars or as bases for a monumental gateway to the city or to the eastern necropolis.

Among the many signs of the social evolution of Felsina is the introduction of writing, which appears at its earliest as alphabetic marks or numerals used on serial bronze or ceramic products. Later it was used to record gifts and votive offerings on clay vessels. The innovation of writing corresponded either to the needs of the artisan and merchant classes to fill the obvious need to record and verify their own activities, or to the desire for public display of the political elite.³⁸⁵¹

4Emilia in the Orientalizing period

Between the end of the eighth century and the year 600, it seems clear that Felsina took political control of a wide territory stretching from the Panaro on the west to the Santerno on the east and ruled the plain as far as the Po, penetrating into the main Apennine valleys that communicate with Etruria proper. The organization of the territory was entrusted to gentilic families of local origin in close cooperation with those who ruled in Felsina. The rich funerary equipment of the territory (at Marzabotto–pian di Venola, Casalecchio, Savignano, Crespellano, San Giovanni in Persiceto, Castenaso, Bentivoglio, Granarolo, San Lazzaro, and Imola) suggests a desire of these groups to adopt the Felsinian model and viewpoint of external representation. Funerary stelae of the Bologna type come from all these sites. In their funerary interments stand out the sheet bronzes, the stamped pottery, and the decorations that came from Felsina. There was probably a matrimonial exchange among the various communities, where the wife moved to the husband's family with her own equipment. Women's tombs are certainly the richest of those of the ruling elite. Among the male equipment, however, the characterization as a warrior and "knight" often appear, in which possession of a horse or a war chariot, usually indicated symbolically by horse bits, is a typical aristocratic sign, as in many contemporary Italic and Greek societies.

The local aristocracies are also identified with more obvious manifestations of power, such as some stelae from Marano di Castenaso (the stele "of the sword") or Bentivoglio (the stele with a sphinx on the disc), the tumuli of Casalecchio, and the central Italic-style manor house found at Imola.

This is probably the period, then, to which the reputation as *princeps Etruriae* (attributed to Felsina by Pliny the Elder) should be assigned. Nevertheless, Etruscan presence north of the Apennines was probably not exhausted with Felsina; even without considering Verucchio, the forerunner of Rimini, other states of affairs should be clarified in Romagna, where at San Varano di Forlì, a funerary stela has been found—unfortunately by accident—entirely different from those from Bologna, with the Tree of Life.

In the west too, the archaeological evidence, which is constantly growing, presents a variety of situations. Two funerary *cippi* from Rubiera, dating to the end of the seventh century, stand out, one with a series of sphinxes and griffins, the other with winged lions. Both *cippi* bear inscriptions, the oldest on monumental supports, using an alphabet different from that used in Felsina. The inscriptions name a person with a binomial name, *avile amthura*, and a *zilath*—in this period a king or military leader. They also reveal the presence of groups of aristocrats who probably came from northern Etruria on the banks of the Secchia, as shown by the alphabet that was used in the area of Chiusi and the typology of the funerary symbolism, which have parallels in Volterrano and the Pisan region. Similar connections with northern Etruria can be followed on the basis of occasional finds along the Apennine rivers as far as the Po, between Taro and Secchia. These are the first signs of colonization processes, which—apart from Felsina—overtook the Po Valley in an area probably originally populated by Ligurians.

5The Archaic period

With the beginning of the sixth century, we observe signs of major change in the archaeological evidence from Bologna and the surrounding area, if not exactly a complete break with the previous picture. Edoardo Brizio, with Pericle Ducati in his wake, maintain that this change was due to ethnic turnover from the Umbrians/Villanovans to the Etruscans. Further research, rendering it ever more evident that the Villanovan culture was none other than the earliest phase of Etruscan civilization, has definitively thrown this interpretation into crisis, but not the bases on which it is founded. Actually, at Bologna/Felsina, the beginning of the sixth century marks a major discontinuity. On the plane of urbanism, the northern fortifications came to be abandoned and the inhabited region was located and organized in the southern sector, following a plan on the basis of recent finds (Via D’Azeglio, Via Capramozza, Viale Aldini), which appears to follow a regular plan of perpendicular axial roads.

In the Felsinian necropolises, contrasting lines of progression appear. The necropolises of the Orientalizing period seem almost abandoned in the southwest and southeast, while others came into use in nearby locations (Giardini Margherita compared to the Arsenale Militare) or are physically separated by built structures (a canal divides the Orientalizing Arnoaldi necropolis from the Archaic and Classical one). In other circumstances, to the north, there was instead continuity of location (Manifattura Tabacchi, Via Belle Arti), but often with the new burials distinct from the older group (Via Saffi, Piazza VIII Agosto) or alteration of the organization of the necropolis (Piazza Azzarita, laid out in rows rather than in groups). In the typology of

interments and their equipment the same variety of solutions. The burials are much more clearly apparent, while among the cremations, nearly always in jars, some primarily female tombs again stand out by the richness of their equipment and adherence to local traditions. Some burials that feature armaments seem clearly to relate to foreigners (Venetic merchants?), while others relate to people of Celtic origin.

The funerary stela from Via Augusto Righi, though it has no context, is traditional in type but features a fight scene between foot soldiers armed with shields and spears, and might offer a clue to a new interpretative hypothesis. It is possible that the gentilic system, probably monarchic in character, was called into question during the Archaic period, with the political ascendancy within Felsina of new classes not linked to the gentilic system, but organized into an army with weapons of the hoplite infantry, following a development that was found simultaneously in both the Greek model and in other Etrurian cities (Tarquinia) and in Rome (the reforms of Servius). There are some additional archaeological indications that serve as further evidence of this new situation, such as the abandonment and reuse of Orientalizing stelae (significant is the use of the stele of Via Tofane as the cover for a pot burial), the ritual burial of the *cippi* of the Via Fondazza, and finally, the exceptional figural repertory of the “*situla della Certosa*,” a bronze vase preserved in a later tomb. The work of a Venetic craftsman working in Felsina that dates to the sixth century, it shows a military parade with the army divided into several ranks of variously armed hoplites led by horsemen. This revolution in the organization of the army was probably the outcome of the changing political situation, including the advance of the Umbrians into Romagna. The Umbrians also occupied the Imolese, and cut Felsina off from Verucchio. The change also saw the renewed presence of the Ligurians in western Emilia, where burial grounds spread out with cremations right next to pots and a few burials. The Ligurians were probably flanked by Etruscan colonists from northern Etruria, who were stationed especially between Taro and Panaro. These new Etruscan colonists may be the initial founders of the city of Marzabotto (*Misa*?) in the Reno Valley during the sixth century. Around 600, furthermore, a new expedition of the Insubres, led by Bellovesus, had defeated the Etruscans of the Po region at Ticinus and occupied the region beyond the Po.

Felsina reacted to this situation with an internal political reorganization, which soon extended to the territory, with the founding of a new port at the mouth of the Po in the Adriatic, at Spina, in 530, and with the occupation and reestablishment of Marzabotto, the new city (*Kainua*) around the year 500.

6The Classical period

In the fifth century, the picture appears to have stabilized. Felsina appears completely reorganized on the urban plane, with new buildings with foundations of cobbles and squared stones, raised in mud brick or burnt brick, with several rooms, probably in regular blocks. The new political stability was sanctioned by the sanctuary complex on the Villa Cassarini hill, on the southern flank of the city, dedicated to *Hercle* and *Aplu*, as it were in the position of a small acropolis. Other minor sanctuaries encircle the city, and craftsmen's installations for the production of ceramics and metals were located in the periphery.

The necropolises, found along the entry roads to the city (from the southwest, Certosa; from the northwest, Via Saffi; from the southeast, Giardini Margherita; and from the north, Piazza Azzarita and Manifattura Tabacchi) were now for the most part arranged in regular rows, taking on an "egalitarian" tendency, but some tombs were distinguished by monumental aspects addressed to the outside, with decorated stelae, *cippi*, and funerary monuments.

The typology of interments, whether burials or cremations, presents a great variety (cremations in pots, in large vases including imported Attic figural ones or bronze vases; burials in wood caskets in simple trenches, or sarcophagi made of blocks of stone), and so does the composition of the grave goods, in testimony to a highly varied and articulated social composition. The richest male and female burials are distinguished by complete sets of banqueting equipment, with bronze tableware imported from Etruria or of local manufacture, and figural ceramics imported from Attica, as well as dining tables, candelabra, lampstands, and torches; arms are rare, but not entirely absent. Social and political prestige is affirmed by the presence of the *diphros*—a magistrate's footstool—and by the display of the typical "horseshoe" stele on the outside, which was hitherto attested only at Felsina and extremely rarely in the surroundings (Casalecchio, Crespellano). There is a variety of depictions, which tend to represent the voyage of the deceased to the beyond, and include mythological and symbolic displays and indications of gender and status (soldiers, female figures). The presence of inscriptions on some of these confirm the presence of certain great ruling families, such as the *Kaikna* (Lat. *Caecina*) and the *Kathle*, *nomen* in three cases of the *zilath*. In this political situation, it is very likely that these were indeed supreme magistrates of what by then was a republican government, albeit ruled by the gentile aristocracy, just as in Rome. This confirms the hypothesis that Felsina had still retained supremacy among the cities of Po-region Etruria in the fifth century. No other city offers such a concentration of signs of power (monumental stelae, funerary display of international prestige, presence of *zilath*, and sanctuary for the tutelary god, an ancient tradition going back to the eighth century).

Around the city, the territory took on a functional organization with the renewed role of Felsina. Lesser centers are known, whether big villages

surrounded by fortifications on the ramparts-and-moat model (Castelfranco Emilia) or organized according to more advanced urban planning, with regular streets and houses with masonry foundations (Casalecchio). The contemporary necropolises of the area around Felsina confirm the impression that there were small centers ruled by families linked to the city (Casalecchio, Sasso Marconi, Riccardina) or else with ties to the Celtic world (Crespellano, Castelvetro). The recent discovery of a manor house just outside Bologna on the Via A. Costa, to which the monumental necropolis of the Stadio may have been related, confirms that the power of the Felsinian elite was still based on the control of territory and probably on its military function. This power is also often evident in the depictions on the funerary stelae, with cavalry and hoplites in arms, as well as with the depiction of the commander of a warship on the stele of *Vel Kaikna* (Fig. 61.1).

7Spina, Marzabotto, and western Emilia

Spina was founded around 530 on the southern branch of the Po known specifically as the Spinete, very close to the mouth, in a marshy (It. *perilagunare*) area on sandy mounds surrounded by water. The main settlement, discovered in the Mezzano Valley in the 1960s, was on a sort of six-hectare island between the course of the Po and a southern tributary. It was surrounded by a system of canals, defended by ramparts and palisades, with a neighborhood of workshops outside it and a ship's landing farther east, at the point where the Po flows into the Adriatic; a sanctuary outside the town lay to the north in Cavallara.

The urban plan consisted of rectangular blocks around a main north-south axis in the form of a broad canal. The houses of this period have not been extensively excavated, but they comprise several rooms with walls of lightweight materials (wood and burnt brick).

Again, most of our information about Spina comes from the necropolises. Some 4000 tombs have been excavated in the two eastern necropolises (in Valle Trebba and Valle Pega) since the 1920s. They date from 500 to the middle of the third century. At Spina, as at Felsina, the variety in interments is considerable, whether cremations or burials; two burials in sarcophagi made from imported Greek marble stand out. The funerary equipment is highly varied at Spina. A constant feature is the great abundance of ceramics imported from Greece, which is only to be expected in what must have been the Adriatic port. Spina supplied all of Po-region Etruria—and, indirectly, northern Italy and Central Europe—with the finished products from Greece and the Near East. This is where exchange with Greek merchants took place, whose presence at Spina is proven by many inscriptions on ceramics; they had come in search of raw materials, grain, slaves, and livestock.

The richness of some of the funerary appurtenances of the fifth century, such as at Tomb 128 of Valle Trebba, shows that in terms of economic resources, the local ruling class did not have anything to envy with respect to the Felsinian aristocracy, and adopted the same funerary customs, including exotic banquet furnishings. Decorated funerary stelae lack, however, and thus the level of external representation entrusted to stone and wooden markers was less important. It seems that at Spina, the commercial bent of the city favored the ascendancy of social groups that were distinguished more by private material wealth, reflected in their equipment, if not in the public ostentation of their rank. At Spina, alongside the Etruscans, a group of resident Greeks were identified as well as populations likely from other stocks, such as the nearby Venetics.

Since the eighteenth century, another Etruscan city has been known at Marzabotto, on the Misano Plain in the Reno Valley. As has been said, it is possible that in the sixth century, the city was called *Misa/Misala*, a name found on the *cippi* from Rubiera. At the beginning of the fifth century, the city was refounded, which required construction work on a vast scale, leveling of the landscape and laying out an urban plan based on a great north-south street crossed by three east-west perpendicular streets. *Cippi* marked with the *decussis*—the cross—which were needed for laying out the street axes according to Etruscan surveying practice, were found at the intersections.

There are thus eight distinct “regions” that are in turn divided into regular blocks, with one or a few spacious dwellings in each, usually with a central courtyard. The foundations were of burnt brick, the walls almost certainly of wood, and the roof of terra-cotta tiles. An efficient water supply system ran throughout the city at the sides of the streets, which were lined by shops and workshops (foundries and potters). Northwest of the city on a little rise stood the acropolis, with three temples and two monumental altars, one dedicated to the gods of the underworld and the other to those of the heavens. Another large tripartite temple was found in the lower city, in the northern sector, dedicated to Tinia, the chief god of the Etruscans. The new city, a real example of planned construction, was certainly called Kainua (“new city”?), the name found on a sherd of bucchero near the temple. It seems clear that this city rebuilding in Felsina took place in the context of a policy of controlling the paths of communication with Etruria proper.

The boundaries of the city are not entirely clear, although at least one gate has been found in the east, which probably led to a necropolis, snugly inserted into a natural rampart consisting of a discontinuity on the plain, which drops off toward the Reno River Valley. Another rampart has recently been found to the north, and there were two sanctuaries, one of which is dedicated to the waters, and the other of which is dedicated to a goddess—perhaps Turan, the Etruscan Aphrodite—of whom a large bronze votive statue has been found.

Two necropolises have also been excavated at Marzabotto—one to the north and one to the east—laid out in groups, with cremations in stone boxes

and burials in graves edged by stones. The grave goods repeat the patterns of Felsina and Spina, at a medium level, adapted to a city of merchants and manufactures.

The mutual role of Felsina, Spina, Marzabotto/Kainua, and the other cities that constituted the dodecapolis of Po-region Etruria, mentioned in the sources, such as Mantua or Adria, is controversial. It is likely that in a framework of mutual autonomy, Felsina retained the role of political capital of a sort of confederation, in which each of the other urban centers played a specific role.

In the fifth century, greater control was exercised by Etruscans in western Emilia as well, where especially in the Modena area, but at least as far as the territory of Fidenza and the Po, agricultural settlements came into existence, from Mirandola (Misericordia Vecchia) to Reggio Emilia (Casale di Villa Rivalta) to Fidenza (Siccomonte) to Cortemaggiore, and genuine farms (for example at Baggiovara di Modena). The agricultural organization of the territory, based in this case as well on considerable reclamation and deforesting efforts on the plain, built on a system of regular canals that anticipated the Roman centuriation, furnished the economic base for exchange with the Greek world by way of the Adriatic and with Etruria via the Apennine valleys.³⁸⁵²

8The aftermath

At the beginning of the fourth century—or maybe even earlier, because it must have been a gradual process—the Boian Celts penetrated into Emilia, after crossing the Po and occupying the territory. The archaeological evidence shows that the western centers fell first, perhaps already in the fifth century, while Felsina and Marzabotto must have been occupied in the first half of the fourth century, perhaps Felsina first and the Apennine center afterward. They were to have different fates. Felsina continued to be occupied and the Boii made it their capital, changing the name to *Bononia*. Marzabotto was destroyed and occupied by small groups of military character.

Spina survived another century, inhabited mostly by Etruscans, but nonetheless politically controlled by Celts (Boii and Lingones), who were unfamiliar with maritime commerce and warships. The Etruscans of Spina thus turned to piracy, but at the same time provided the Adriatic port through which the Celtic elite provisioned themselves with valuable merchandise. The goods from fourth-century Spina and the dwellings excavated in recent years confirm the situation. The piracy and commercial activity of Spina were still accompanied by major craftwork manufacture like ceramics. Nonetheless at the beginning of the third century, after the battle of Sentinum and the ensuing extermination of the Senones by the Romans, the Celts—probably Boii—freed themselves from a center that may have formed a natural ally of Rome

and a bridge to the Venetians (who had always been faithful allies of Rome itself in anti-Celtic matters). They besieged Spina and compelled the residents to abandon the city.

76–77Romagna and the Marches

Introduction

At the end of the Bronze Age the same archaeological *facies* still seems to unite, together with Umbria, the two bordering regions to which these chapters are dedicated.³⁸⁵³ In the Early Iron Age, however, their history begins to divide, as is shown both by the difference of the *facies* between Villanovan Verucchio and Picene³⁸⁵⁴ Novilara, although geographically close to each other (Figs. 76.1 and 77.1), and by the noticeable distance (ca. 200 Km) that separates Fermo from Verucchio, both true Villanovan ‘bridgeheads’³⁸⁵⁵ in the Adriatic. In spite of the strength of the reciprocal relationships that were always to continue to link the two regions, it is not arbitrary to treat them separately.

Patrizia von Eles

76Romagna

Abstract: Romagna includes a large region from the southern boundary with Marches to the Province of Forlì. Traditionally and culturally though the area southeast of Bologna including Imola is seen as being part of Romagna and it will therefore be considered here. The focus being relation between Romagna and Etruria, the outlook is necessarily different between Early Iron Age, with main point of attention on the southern Adriatic and Verucchio, and the later period when the whole territory sees a different panorama.

Keywords: Verucchio, Fermo, Adriatic sea, Early Iron Age

Introduction

Current definition of Romagna (Fig. 76.1) includes a large region from the southern boundary with Marche to the Province of Forlì. Traditionally and

culturally though the area southeast of Bologna, including Imola, is seen as being part of Romagna and it will therefore be considered here. As will be shown, the focus being relation between Romagna and Etruria, the outlook is necessarily different between Early Iron Age, with the main point of attention on the southern Adriatic and Verucchio, and the later period when the whole territory sees a different cultural panorama.³⁸⁵⁶

The area around Imola during Early Iron Age and up to the first half of the seventh cent. BCE is strictly connected to Villanovan Bologna. As documented by well-known old finds and by recent excavations in Orto Granara, Pontesanto and Ca' Borghese it can be assumed that relations of this area with Etruria directly depended on Bologna. This territory was essential to the economic survival and the urban development of Bologna; new excavations in Imola clearly show that the relation was based on the direct establishment of aristocratic groups with important settlement structures and reserved small but prestigious and rich burial grounds (Fig. 76.2) where distinction symbols, such as thrones, were used in male and female graves. These elite families organized and controlled an intensively occupied area, certainly extremely important for agricultural activities³⁸⁵⁷ and probably had some kind of role in handling routes and commercial links between Bologna, the Adriatic and possibly also partly Etruria. Iron Age settlements in the Appennine valleys and a possible direct connection between northern Romagna and Etruria are documented, already in the eighth and early seventh centuries. BCE, by the Borgo Tossignano, Gaggio, Fontanelice and Montericco graves in the Santerno Valley. Between Imola and Cesena there are no known Early Iron Age settlements, but a lozenge belt buckle (It. *cinturone a losanga*) found near Marradi in the Lamone Valley is a likely testimony of direct connection with Tuscany, along a route later to be followed during the Second Iron Age.³⁸⁵⁸

1The Final Bronze Age

With regard to the Adriatic regions, the essential question of relations with Etruria needs to be approached starting from the Final Bronze Age situation, when in the Marecchia Valley, a territorial system is recognizable with hill

settlements in San Marino, Ripa Calbana, Monte Copiolo, Monte Perticara, and probably San Leo. There are different opinions about the cultural definition and the significance of this area in the general frame of Italian Final Bronze Age, but it is quite clear that it had an important role in relations with Northern Oriental Italy, Northern Internal Etruria and Marche.

Information is not quite sufficient for a detailed chronology of the various Bronze Age sites. It has been suggested that settlements in Calbana, San Marino and Verucchio as well as bronze deposits from Casalecchio di Verucchio and Poggio Berni can be dated to the early or middle stages of the Final Bronze Age not to the end of this period. On the hilltop of Verucchio, in Pian del Monte, recent explorations have brought to light remains that prove the existence of a Final Bronze Age settlement³⁸⁵⁹ with definite comparisons to the Pianello facies, whose relations with northern inner Etruria are generally acknowledged.³⁸⁶⁰ Due to our still incomplete knowledge of this phase in Romagna continuity with the Early Iron Age settlement it is not clear. It can be underlined though that the choice of the site in the Early Iron Age seems to follow an earlier territorial pattern.

If the most important Early Iron Age necropoleis, Verucchio and Fermo were, as generally regarded, proof of the early settlement on the Adriatic coast of Etruscans coming from southern Etruria,³⁸⁶¹ this would indicate a quite conspicuous change in the direction of contacts between the two sides of the Apennines from the Final Bronze Age to the Early Iron Age. However contacts with northern Etruria and Chiusi in the first half of the eighth cent. BCE should also be taken into consideration.³⁸⁶² At present, taking into account the territorial system, is difficult to consider the development of the Villanovan expressions in Romagna only as directly emanating from Etruria or even as a real colonial phenomenon. However, the emergence of Villanovan culture in Romagna shows a disruption with the past and the beginning of a new historical cycle which developed through a complex system of relations (parental, tribal, ethno-linguistic, religious and cultural). Within this scheme large new structured settlements likely began with the arrival of new groups, as well as with a reorganization of local communities whose inhabitants, upon becoming part of a new system, created their own identity adopting new cultural codes in a consciously selective way.

2Verucchio

In the ninth cent. BCE Verucchio became the leading center in Romagna, part of a well structured network of Villanovan sites in a territory that extended from San Marino to Cesena.³⁸⁶³ It maintained its role as the leading Villanovan center until the second half of the seventh cent. BCE.

The choice of Verucchio as the basis of Romagna territorial system in the

Iron Age is obviously a strategic one, aiming at control of the Adriatic Sea and functional to an early inclusion in commercial exchanges with northern and central Europe. From the eighth cent. BCE, amber was a primary factor in the economic development of Verucchio that certainly had a central role in controlling this commerce on the Adriatic and through the Apennines toward central and southern Italy. Other items, like tin, were probably also very significant in the connections between the Mediterranean world and Central Europe.³⁸⁶⁴

Relations between Etruria, Romagna and Bologna from Early Iron Age have long been discussed.³⁸⁶⁵ Within the Etruscan “system” each center had its peculiarities in social and economic organization, which were reflected in cultural identity features. This is easy to see in Verucchio which clearly fits a general scheme where during the first phase (ninth cent. BCE) a more homogeneous appearance is shared by all Villanovan territorial aspects. As early as the ninth cent. BCE, differences can be seen between the various areas, to be considered as marks of cultural identity but it was really during phase II (early eighth cent. BCE) that each large center developed its own peculiar features. A process of identity building that can be fully understood only in a diachronic and integrated perspective paying attention in some instances to typological attributes, in others to rituals or perhaps also to the dressing codes.³⁸⁶⁶

From Early Iron Age onward site occupation strategies continued along lines already established in earlier periods, allowing for control over the Marecchia valley and the coast.³⁸⁶⁷ This is clearly demonstrated by the location of both settlements sites and necropoleis. Based on our present knowledge, in the ninth cent. BCE two separate cemeteries faced the Adriatic (Lippi)³⁸⁶⁸ and the Marecchia Valley (Lavatoio); only later, sometime before the middle of the eighth cent. BCE, other groups used necropoleis (Moroni and Le Pegge) situated on the east side towards the Ausa Valley and San Marino (Fig. 76.3). The greatest part of modern research is due to Gino Vinicio Gentili whose suggestion that the different burial grounds correspond to groups having separate settlements is probably correct, although it is difficult to know exactly how the settlement structures were distributed.

Early Iron Age pottery had been found by Gentili on the southern border of the Pian del Monte plateau (Cappuccini), in a position directly overlooking the Lavatoio necropolis, a strategic location for control of the Marecchia Valley. On the opposite side, on a terrace overlooking the Adriatic Sea and the Lippi Necropolis, excavations conducted in 2009³⁸⁶⁹ demonstrated occupation and working activities starting in the Early Iron Age. Other undocumented finds attributed to settlement remains under the medieval castle were reported by Renato Scarani.³⁸⁷⁰ On Pian Del Monte, the hilltop having an extension of approximately 26 ha, Gentili³⁸⁷¹ mentions several structures (“*capanne*”) found in the central area which he dates to the Villanovan period. Unfortunately no systematic explorations have been conducted and published:

it is therefore difficult to understand their real significance and chronology; occupation certainly continued after the Final Bronze Age, but it is difficult to evaluate and interpret the finds.³⁸⁷² It is possible that the area was not all in contemporary use, and changes in the destination are also likely. For the earlier phase, the large pit close to the center of the area³⁸⁷³, contained what seems to be only practical use pottery, while finds relating to the eighth cent. BCE³⁸⁷⁴ and later, are connected to a sacred area and ritual activities that continued after the collapse of the Villanovan social and economic system during the second half of the seventh cent. BCE.

Fig. 76.3: Verucchio, settlement area in Pian del Monte and necropoleis (from von Eles 2014)

We do not know how the Iron Age center was called: a name from which probably derived *Ariminum* (the later Roman colony); a name that – as that of the river Marecchia (*Ariminus*) – has been connected to that of Ἀριμνήστος, “king of the Tyrrhenians the first of the foreigners to present an offering to the Olympic Zeus at Olympia”³⁸⁷⁵, whose *gens* might have had a role in the Etruscan presence in Verucchio.³⁸⁷⁶

Our knowledge of Verucchio is mainly based on funerary data. The four known necropoleis have only partially been explored. In the most extensive, Lippi necropolis, located at the foot of the hill, overlooking the Adriatic, over 400 graves have been identified; in other cemeteries (Lavatoio, Le Pegge and Moroni) even more limited explorations have taken place for a total of less than 200 graves.

All are cremation graves, except for very few dating to the final period³⁸⁷⁷, burial structures vary from simple pits to quite elaborate settings, in exceptional cases similar to chamber tombs, a variety which is certainly not only due to chronological development.

In all known necropoleis characteristics of graves structures and grave goods correspond to what Adriano Maggiani³⁸⁷⁸ synthetically defines as the archaeological markers of an established aristocratic system: exhibited richness, social differences and consciousness of family ties. Although the total number of graves can only be approximately estimated, the necropoleis seem to have been used in each generation only by elite groups consistently increasing the number of their members toward the end of the eighth cent. BCE.

Based on present knowledge, there are differences among groups as to the period of use of the necropoleis and adoption of partly different rituals, which could be another way of stressing identity, the same attitude shown by the whole community toward the “external world”.

During its entire development Verucchio villanovan and orientalising *facies* seems to be characterized by three main factors dynamically related.

1. Accepting and including cultural elements from different areas: Bologna, Piceno and Etruria;
2. Capacity to start new technologies and/or elaborate new types particularly in amber craftsmanship as well as in metallurgy;
3. Choosing to preserve objects or types which, without clear changes, continued to be included in funeral deposits for several decades.

Without going into a detailed analysis, with regard to the first issue, in the earliest phase attention is drawn towards southern Etruria and Umbria;³⁸⁷⁹ in the first half of the eighth cent. BCE³⁸⁸⁰ contacts with Bologna were manifestly quite strong; at the end of the eighth and early seventh centuries BCE direct contacts with Etruria are well demonstrated, not only in lifestyle and prestige symbols, most of which (i.e. thrones, fans, belt clasps *It. affibbiagli*)³⁸⁸¹ shared by other Late Iron Age and early orientalizing

communities in Italy. Almost exclusive persistence of cremation rite corresponds to what happens in internal northern Etruria. It is impossible to establish whether or not this similarity is due to something more than similar cultural developments. Comparisons with Chiusi and Volterra can be found in particular pottery finds³⁸⁸² and many types of fibulas.³⁸⁸³ The presence of wooden thrones in Verucchio seems to have served different purposes in funerary rites than the later bronze and terracotta thrones in Chiusi;³⁸⁸⁴ in Verucchio they were not used as a “seat” for the urn,³⁸⁸⁵ even if these are personalized and dressed up. Close connections of Verucchio with Marsiliana and Vetulonia have been frequently underlined. The existence in Verucchio of workshops active in the production of bronze (helmets, cups with high openwork handles, *ciste a cordoni*) and iron objects (long curved knives and daggers) suggests trade with sites of metal ore production likely on the Tyrrhenian coast. Iron ore could reach Verucchio via Chiusi through the Marecchia Valley, while amber, as well as probably tin and copper, arriving to Verucchio from central Europe could then reach the Etruscan centers on the Tyrrhenian coast.³⁸⁸⁶ It is significant that amber craftsmanship in Verucchio and Vetulonia seem to follow completely different models.³⁸⁸⁷ Proof of a mediation role of Verucchio in contacts between central Europe and Etruria (Tarquinia and Vetulonia) can be found in particular kinds of vessels or horse harnessing equipment.³⁸⁸⁸

A preliminary analysis of topographical organization is possible only for Lippi necropolis. It shows that already in the first phase a large part of the burial ground was already in use and that later grave groups developed mostly around the early ones.³⁸⁸⁹ In addition to topographic distribution of graves other factors clearly indicate that elite families were already established and well conscious of family ties from the ninth cent. BCE: the frequency of several depositions within single or closely connects pits, anthropological examination of the human remains showing mixed composition of grave goods as to gender and age and a consistent percentage of urns containing more than one individual.³⁸⁹⁰

Equally clear is the intentional stressing of specific self-representation and identity marks,³⁸⁹¹ as demonstrated by the development of very complex funerary rites as regards the choice of objects as well as the ways to manipulate and place them in the grave. It cannot be without meaning that the most impressive differences from other Villanovan contexts concern objects connected to ritual functions.³⁸⁹² Almost completely absent are objects typical of Bologna: ritual trays (It. *presentatoi*), bronze small footless one-handled cups (It. *capeduncole*), globular closed containers (It. *incensieri*), small bronze shovels (It. *palette*)³⁸⁹³, *tintinnabula*³⁸⁹⁴, pottery cylindric supports (It. *vasi a diaframma*) or double vases (It. *vasi gemini*), brown and red painted ware. Other items have their symbolic or ritual equivalent in objects with a different shape or decoration: the fan-shaped axes (It. *asce a flabello*) are replaced by heavy axes, made useless by small chains attached to the cutting edge;³⁸⁹⁵ the

bronze cup with high openwork handle has a recurring decorative scheme on the handle³⁸⁹⁶ typical of Verucchio and in some cases a human figure supporting it (Fig. 76.4).

At the end of the eighth and in the first decades of the seventh cent. BCE Lippi necropolis shows several high rank groups that include both male and female graves; a similar situation is also shown in Moroni and Le Pegge necropoleis. This could mean a certain amount of conflicts in power-sharing between leading high-ranking personalities, a conflict which could represent one of the weak points of the “Verucchio system” probably responsible for its sudden collapse.³⁸⁹⁷

The most famous grave is Lippi 89/1972 with a rich and exceptional set of gravegoods deposited in a deep pit.³⁸⁹⁸ Above a large wooden chest a decorated wooden throne had been placed (Figs. 48.4 and 76.5); inside the chest a large bronze *situla* was found, which served as the cinerary urn. It was “dressed” with textiles, weapons, gold, amber and bronze ornament; in the chest were also found other wooden objects, ornaments, weapons, bronze and pottery vessels, chariots and harnessing equipment. This grave has connections ranging from Central Europe to Tarquinia and Vetulonia and can be dated to the end of the eighth or early seventh cent. BCE.

Fig. 76.4: Bronze cups with openwork handle (1. Verucchio Grave Lippi 32/2006 from von Eles ed. 2007 2. Verucchio, Grave Le Pegge 3/1970, from Gentili 2003; 3. Spadarolo, Museo Civico di Rimini)

Some of the female graves contained not only very rich and complex sets of grave goods which indicate that the women had high social status and

significant roles.³⁸⁹⁹ Among the richest graves are Lippi 47/1972, 32/2006 and 40BIS/2006, all including exceptional amber fibulas (Fig. 76.6), one of the highly specialized productions of Verucchio.

In the matter of technologies and craftsmanship, Verucchio offers the most surprising data. The leading groups provided social stability, through control of the territory demonstrated by the importance of warriors, and the continuous and consistent importation of minerals and amber. Specialized artisans produced, for specific clients, – in different materials like amber, bronze, iron and glass – very particular objects that can be considered strong signals of cultural identity. Innovative techniques were used in specialized workshops where artisans of different fields worked together. Although it might be suggested that the amount of amber found is only due to exceptional preservation conditions, it must be stressed that Verucchio developed highly specialised craftsmanship using amber not only in ornaments but also in many different classes of objects, which do not seem to have comparisons in other Iron Age sites. In other instances Verucchio artisans produced objects that, although perfectly similar to items found elsewhere are not functional, demonstrating the importance of some pieces from the exclusive point of view of social communication.³⁹⁰⁰

Fig. 76.5: Throne from Verucchio, grave Lippi 89/1972 (from von Eles 2002)

Fig. 76.6: Amber fibulae from Verucchio (from von Eles 2015b)

The most elaborate fibulas were never produced in greater numbers than necessary for the costume of one lady. On the contrary, there is proof of “serial” production of metal weapons,³⁹⁰¹ like strong long iron knives, present in more than fifty pieces, or the conical crested helmets,³⁹⁰² both once considered of Picene origin. This means that distribution of some products went far beyond the local area and reached what we would now call “external markets”, certainly Bologna, Piceno and possibly Etruria.

Control by the elites over the artisans and limitations in the use of the burial grounds imposed by the aristocratic families can also be inferred by the absence of artisans' burials.³⁹⁰³ The economic system seems similar to that presently acknowledged only in the Archaic period at Murlo. The social and economic system was apparently guaranteed in Verucchio by the warriors, whose role increased during the eighth and early seventh centuries BCE, but lost some of its importance in the final phase, apparently a sign of the beginning crisis. It was a situation full of contradictions with a very strong role of specialized craftsmanship that would naturally tend to an urban social and political structure: a trend toward which did not occur in Verucchio aristocratic society.

During the final phase of the evolution of the Villanovan society of Verucchio, which came to an end not much later than the middle of the seventh cent. BCE³⁹⁰⁴, the local community contracted consistently but continued to produce or accept innovation in rituals and artefacts. New objects were pottery with stamped decoration, some types of weapons and horse harnessing equipment, amber objects. There were no changes in the social structure: warriors continued to have an extremely important role, though new weapons assemblages might indicate some internal reorganization. Cremation continued to be the only adopted funerary rite; only a small number of inhumation graves, with very simple sets of grave goods – similar to those present in Bologna around the middle of the seventh cent. BCE were placed in a central area of Lippi necropolis, apparently not previously used, where two ritual depositions of horses were found in 2008. The sacrificed horses were not related to any specific grave, so it is likely that their deposition might be connected to collective rituals as seems to be the case for a similar situation recently recovered in Bologna, in the necropolis of Via Belle Arti (Fig. 76.7).

Date and meaning of the end of the social and economic system documented at Verucchio in the Late Iron Age are still under discussion.³⁹⁰⁵ Some scholars have in the past underlined the interruption existing in the necropoleis,³⁹⁰⁶ while others believed in continuity apparently shown by the settlement structures in Pian del Monte.³⁹⁰⁷ What cannot be doubted at present is the abrupt end of the economic and social system expressed in the Villanovan necropoleis and in the settlement structures as now documented by new excavations in Pian del Monte.

Fig. 76.7: Horses burials: 1. Verucchio, Lippi Necropolis; 2. Bologna, Belle Arti Necropolis (from von Eles, P., M. Mazzoli and C. Negrini forthcoming)

An indirect signal of changes pertaining to the economic basis of Verucchio can be seen in the changes in amber trade and working traditions: before the

end of the seventh cent. BCE Verucchio no longer played the central role in amber trade. Instead amber had a highly increased diffusion in Piceno, but object types and techniques follow totally different patterns.³⁹⁰⁸

Several reasons can be suggested for Villanovan Verucchio crisis:

- 1.the limited extension of the settlement site and difficult access to it, although certainly strategically favorable during Early Iron Age, were factors that probably became severe impediments to change and development;
- 2.the significant activity in the Adriatic region of Umbrian groups whose widespread presence has been recently confirmed by a number of new finds in several sites in Romagna, Imola and Bologna;
- 3.the inability of the hegemonic groups (who continued to express their role and identity in fundamentally unchanged ways) to cope with new dynamics in a time when fully urban centers developed in central Italy and the Adriatic region, meaning that the power these dominant groups acquired in the preceding centuries became their weak point and no longer a strength;
- 4.the existence of internal contradictions among different groups within the community.

3Archaic and late archaic periods

Gentili dates to the sixth cent. BCE his phase IV³⁹⁰⁹ suggesting that the cultural change could be partly due to the appearance in the area of umbrian groups. Malnati as already mentioned³⁹¹⁰ accepts a discontinuity with respect to the end of the villanovan necropoleis, in his opinion to be placed at the end of the seventh cent. BCE.³⁹¹¹ He also observes that there is lack of documentation between the later graves in the Villanovan necropoleis and the Pian del Monte structures that cannot be dated earlier than the last quarter of the sixth cent. BCE.³⁹¹² Recent excavations by Pavia University in the area and under the so called “umbrian or etruscan house”³⁹¹³ confirm a definite iatus between the latest villanovan structure (first half of the seventh cent. BCE) and the building of the “Casa Umbra (ovvero Etrusca che dir si voglia)” in an advanced moment of the IV cent. BCE³⁹¹⁴.

After the seventh cent. BCE finds in Verucchio are concentrated in Pian del Monte but only ritual activities show some kind of continuity. The end of the eighth cent. BCE sees the already mentioned ritual deposition of bronze shields near pre-existing pit filled in the fourth cent. BCE with selected potteries, bronze statuettes and many bronze fragments presumably originally located in a nearby cult area open to presences from distant region: Etruria, Piceno, Veneto and for the first time also Lombardy, as demonstrated by objects recovered from the pit.³⁹¹⁵

From the sixth cent. BCE a general change is quite definite both with regard to of cultural panorama and territorial setting in Romagna.

Cultural differences are evident in the burial grounds: cremation disappears, inhumations (frequently multiple deposition) are disposed in circles (Fig. 76.8); pottery shapes and ornaments types change and also show marked differences from those attested in Etruscan Felsina. In the largest explored necropolis, Montericco in Imola, combined analysis of archaeological and anthropological data shows changes in the social structures and roles during the period of use. In the central phase individual role is particularly underlined by the importance of weapons³⁹¹⁶ in young warriors graves, and by the marginal location of children depositions, in the later period family ties seem to prevail, with children graves placed inside the circles stressing their being full members of the family groups.³⁹¹⁷

Attribution of this cultural *facies* to Umbrians has been generally acknowledged since Giovanni Colonna and Mario Zuffa studies³⁹¹⁸ mainly based on the finds from San Martino in Gattara.³⁹¹⁹ Recent doubts advanced by Giuseppe Sassatelli³⁹²⁰ have been rejected with adequate answers and updated information by Colonna to which nothing need be added.³⁹²¹ New data, due to territorial researches and excavation by Monica Miari³⁹²² and the present author indicate that, Umbrian settlements are well documented in the plain between the Apennines and the Adriatic coast, reaching Ravenna.³⁹²³ Presence near Medicina (south east of Bologna) of Umbrian settlement structures and graves overlaying a small earlier Villanovan necropolis indicates a possible contraction of Bologna territory.³⁹²⁴ A similar situation had already been documented in Imola where orientalising graves were found in the area of Montericco Necropolis.³⁹²⁵

1

2

Fig. 76.8: Burial circles. 1. Montericco Necropolis (from von Eles 1981) 2. San Martino in Gattara (from Bermond Montanari 2005)

Interaction, suggested by Colonna on the basis of the bronze breast-plate from Rio Carpena and of a particular type of bronze belt-buckles, which he believes made in Bologna and from there diffused to Romagna (Castrocaro, Forlì),³⁹²⁶ has been recently confirmed by “Umbrian” fibulas (Casalfiumanese type) in Bologna Belle Arti graves dated to Bologna IV C phase.³⁹²⁷

Presence of the Umbrians in Romagna certainly did not interrupt contacts

with Etruria also through the Apennine valleys as proved by the San Varano gravestone, found at a crossway of the roads coming down from Tuscany with the plain road connecting Bologna to the Adriatic coast, which shows direct influences from Tuscany.³⁹²⁸

From the end of the seventh cent. BCE in southern Romagna organization of the territory changes, with control moving to the hills nearer to the coast; pressure from Umbrian groups is well documented and could also explain the already mentioned lack of documentation in Pian del Monte settlement in the first part of the sixth cent. BCE. It has long since been established, on the basis of both archeological and epigraphic data,³⁹²⁹ that Etruscans continued to have in the area a very significant role as shown by Etruscan inscriptions found in Verucchio and Convignano:³⁹³⁰ direction of contacts were new and point mainly at Tyrrhenian Etruria (Volsinii) through the Ausa valley; continued Etruscan presence in the higher Marecchia valley has been recently indicated by the discovery at Ponte Messa, near Pennabilli, of a large stone with an etrusco-corinthian bas-relief connected to a kind of monuments well-known in Chiusi and in Val d'Elsa in the first half of the sixth cent. BCE.³⁹³¹ Contacts through the Marecchia valley have also been documented in recent excavations near San Sepolcro³⁹³² by the In the lower Marecchia valley Covignano substitutes Verucchio as the most important center: but the two cult areas documented at San Lorenzo in Monte³⁹³³ and Villa Ruffi probably also attracted external contacts.³⁹³⁴ The sanctuaries in Covignano as well as in Pian del Monte continued to be in use probably deriving their importance and significance from being “places of tradition and memories”.³⁹³⁵

77The Marches

Abstract: The Marches stretch along the eastern slopes of the Apennines to the south of Romagna on the shores of the Adriatic Sea. This region is crossed by parallel river valleys, like the teeth of a comb, but those of the Esino and Potenza, amongst the most important rivers of the central area, are connected at the base of the mountain, where Fabriano and Matelica are found, by an easily crossed geological depression. It was, therefore, the mountain passes, the maritime routes, and the coastal and lower valley plains that allowed the penetration of the Etruscans, whom ancient literary sources and archaeological evidence attest as both a sporadic physical presence and more generally as agents of a cultural influence.

Keywords: Picene civilization, Cupra, Fermo, Matelica, Orientalizing

1Early Iron Age Fermo in its regional context

As the theme of the Etruscan presence in Romagna centers on Verucchio, at the beginning of the Early Iron Age and throughout the almost two centuries of its duration, so in the Marches it essentially centers upon the weight given to the Villanovan nucleus of Fermo,³⁹³⁶ whose very existence, in contrast to the contemporary, but not uniform, spread of Picene civilization³⁹³⁷ throughout the rest of the region, is amazing in its isolation.³⁹³⁸ (Fig. 77.1) To the south of the promontory of Conero and twice the distance of Verucchio from the Apennine ridge, Fermo is, in fact, much further also from the basin of the Tiber and so, compared to the other regions of the peninsula where the Villanovan culture spread, truly isolated by land.³⁹³⁹ Here, in any case, unlike Verucchio, the Villanovan settlement seems always to have remained within the limits of a single site, which archaeology continues to show us as being devoid of appendages of similar *facies* in the surrounding territory,³⁹⁴⁰ and almost without any reflection in the following period,³⁹⁴¹ when, from the seventh century BCE, it takes on the characteristics of one of many centers of the zone belonging to the Picene civilization.³⁹⁴² This change— though the funerary grave goods of the seventh century BCE remain completely unpublished, but are anyway devoid of startling signs of orientalizing character³⁹⁴³ — is yet to be clarified in its unwinding and causes; but as for its effects, it does not seem to have left or indeed filtered the slightest legacy of mythical-historical accounts or secure enough traces in the toponymy.³⁹⁴⁴

Fig. 77.1: The Marche and sites mentioned in text

In a territory perhaps only apparently uninhabited³⁹⁴⁵ at the end of the Bronze Age, scarcely seven kilometers from the sea, and dominating from on high all the expanse of low and perhaps then marshy beach between the mouths of the rivers Tenna and Ete Vivo, Fermo is already easily recognizable as Villanovan in the 9th century BCE. (Fig. 77.2) The two necropoleis of Misericordia and Mossa, explored several times over during the work of the expansion of the modern city, actually began with tombs belonging to the older period of the Early Iron Age and already typically Villanovan, with

elements which — apart from those less indicative in such a sense and common to the areas of Umbria and the Marches — recall both southern and inland Etruria, especially through the pottery³⁹⁴⁶ and prestige objects, and to a lesser extent Bologna, particularly through small bronze objects such as fibulae and others. In this first period the funeral rite is exclusively incineratory; the biconical urns, decorated in the canonic forms and closed by a bowl, turned upside down, with the edge curving inwards, or, more rarely, with a truncated cone and only blocked at the mouth thanks to the brimmed edge, are found inside simple pits. These have burnt earth at the base, which in several cases³⁹⁴⁷ goes as high as the stone covering. Funerary objects are rare, often consumed by fire and almost solely of personal apparel; there are no weapons, but often in male burials we find the crescent-shaped razor and in female almost always the addition of the spindle. As regards the relatively early beginning of the necropolis of Misericordia, which has also provided us with two urns of a form still echoing Protovillanovan models, the later date for the necropolis of Mossa³⁹⁴⁸, — actually far less known because of the serious delay in the restoration of almost all the finds — could be more apparent than real.

Fig. 77.2: Fermo: the hill (in the middle) and the necropoleis (on both sides) (after Baldelli 2000c, 57)

It is only close to the passage to the second phase of the First Iron Age (when observation of the incineratory rite also becomes less rigid, with, for example, an end to the rigorous practice of filling the pit to the brim with burnt earth) that there begin to appear at Misericordia, perhaps significantly in

female burials, the first trench tombs for individual interment: in one case,³⁹⁴⁹ already on a wooden plank — as will be seen more frequently later on³⁹⁵⁰ — and with the addition, also for the first time,³⁹⁵¹ of some supplementary small jars beside the biconical urn, not used for incineration; in a second case,³⁹⁵² with a little gold parure³⁹⁵³ as a first isolated supplement of objects of great prestige.

It is more prudent,³⁹⁵⁴ instead, to date the Misericordia tomb 8/1911 to the second phase, largely corresponding to the 8th century BCE, because of the quantity of grave goods³⁹⁵⁵ and in spite of the presence among them of at least one arched fibula with a whole curve apparently twisted.³⁹⁵⁶ Consequently, this tomb's bronze crested helmet,³⁹⁵⁷ a true status symbol of a war leader, loses every primacy on being deposited, conforming to more general use, just as others like it, documented at Verucchio and also in Etruria itself, where so many helmets are put in the tombs sooner or later after their use.³⁹⁵⁸ Equally attested in the same burial is the stratum of pebbles on the base of the burial trench and covering the interment, which, like the use of burying more than one body inside the same trench,³⁹⁵⁹ appears on other occasions in the necropoleis of Fermo only from the second phase.³⁹⁶⁰

In the course of this phase, then — following the evolution which, elsewhere as well, is in any case mostly Villanovan — interment continues to spread until it in its turn becomes the sole method. We also see, in both interment and incineration, the continuance and indeed enrichment and progressive increase in numbers of the new combinations of grave goods presented in the earlier context of the passage from one phase to the other. In a number of cases these succeed in giving us a hint — but only a hint — with the first clear signs of belonging to a high social group,³⁹⁶¹ of a more ample provision of true panoplies and sets of dishes. Examples of these are, respectively, the grave goods of the male tomb Misericordia 78S/1957, with an *antenna* sword of the Fermo type inside a sheath and a breastplate, probably of the Latium model, both of bronze (Fig. 77.3), and the female grave goods of Misericordia tomb 63Q/1957, with an amphora with crested handles, also of the Latium type, and a small cup with stamped decoration, both clay and placed one inside the other.³⁹⁶² The grave goods of two other tombs are each marked by a larger vase of thin bronze and inside a small clay cup for drawing out the contents: the male tomb Misericordia 2B/1956³⁹⁶³ has a situla with moveable handles with cruciform attachment, of a central-European type but most probably of northern-Etruscan manufacture; and the female tomb Misericordia 121S/1957³⁹⁶⁴ has a ribbed pail. Finally, in this last burial a lozenge belt buckle seems worthy of note, made of bronze and already repaired in antiquity, which can be placed alongside three others found in the same necropolis and a fifth kept in the Museum of Fermo, also of plausible local provenance.³⁹⁶⁵

2Fermo, Cupra, and the Etruscans

Fermo's isolation in the First Iron Age is, however, not only detectable from

the type of cultural material recovered from the burials and from the ideological and social reality which can be inferred on its basis, but also from the exceptional nature, compared to all the surrounding territory, of the inhabited proto-urban dimensions that can be deduced from the whole topographical situation, as was first seen by Renato Peroni.³⁹⁶⁶ The necropolis of Misericordia probably developed at the beginning along the course of the ridge leading directly inland, and the other necropolis, of Mossa, from the other side, at the beginning of the slope that descends towards the Adriatic Sea, leaving the mid-ground on the higher part of the hill for habitation, a large empty space of around 100 hectares. Such a general settlement scheme, like its relation to the geo-hydraulic situation,³⁹⁶⁷ is actually no different from that of the Picene centers further south³⁹⁶⁸ and of other known centers in the rest of the same civilization;³⁹⁶⁹ but it is the spaciousness of the central area that is not found in these centers, and makes us turn to the comparison, yet again, with the contemporary great protourban centers of Villanovan Etruria.³⁹⁷⁰ Yet it is true that at Fermo the gentle and hilly landscape is completely different from that of the bounded tufa plains of southern Etruria and the rock of Verucchio;³⁹⁷¹ and so we should not imagine that sparse areas of habitation uniformly covered the whole surface, from time to time steep and rugged,³⁹⁷² on which the mediaeval city then spread itself.³⁹⁷³ Indeed, in view of the general lack of sure evidence, this cannot be said even for Verucchio:³⁹⁷⁴ the Roman Picene cities themselves, characterized by intensive urbanization, rarely exceeded 20 hectares. On this, most recently and with reference to prominent situations in Etruria, Giovannangelo Camporeale has written of the organization of the inhabited areas by ‘quarters’, close to the necropoleis.³⁹⁷⁵ The suspicion could also arise that the huge resources (demographic and economic) required for whole inhabited occupation of the wide intermediate space never existed, so determining at Fermo the impossibility of passing to a more advanced phase of urban formation,³⁹⁷⁶ and thus establishing the premises for the final absorption of the Villanovan enclave into a different local context.

Massimo Pallottino³⁹⁷⁷ suggested the hypothesis of a link between Villanovan Fermo and the important coastal sanctuary, 20 kilometers further south, of Cupra, still not identified in the territory of the Roman city of *Cupra maritima*.³⁹⁷⁸ The suggestion was possibly made to avoid admitting an exception to the rule of the substantial coincidence between the areas of Villanovan spread and, in the historical period, of definite Etruscan occupation — an exception which was, however, then made explicit by Delia Lollini.³⁹⁷⁹ Pallottino, who continued to develop and support his hypothesis until the end, added the idea of an early penetration from the north ‘by a maritime route... perhaps. .. from Romagna’. According to Strabo (5.4.2. C 241) *Cupra maritima* was a known foundation of the ‘Tyrrhenians’, who absorbed the cult there, lending to it the cult of *Hera* (or *Uni*).³⁹⁸⁰ After Pallottino came those³⁹⁸¹ who wished to see in the Villanovan nature of

Fermo the outcome of a true colonial episode in the context of the so-called 'first Etruscan colonialization', which, however, could not be followed, over the passage of time, with all the necessary continuous support from the mother country.³⁹⁸² The theme remains a subject of discussion,³⁹⁸³ both through the claim to a local root of the 'Villanovan revolution' at Fermo (and in the other parts of Italy) due to the work of Peroni,³⁹⁸⁴ and through the more recent (and converging) critique of the concept itself of 'double colonization' and of 'first' and 'second' Etruscan colonization on the part of Giuseppe Sassatelli.³⁹⁸⁵ In the meantime, while with this last question the view of integration between various ethnic components, and of different provenance, has gained some way,³⁹⁸⁶ Giovanni Colonna, lending perhaps excessive weight to the modest though important territorial discontinuity between the districts of Fermo and Cupra, has preferred to defer few centuries later the Etruscan presence³⁹⁸⁷ at the trading sanctuary recorded by Strabo and has framed it in the historical circumstances of the 'long march' of the Etruscans from the Po valley in the direction of Cumae in 524 BCE. In this way he did not notice the contradiction with the sample of significant Etruscan imports of the first half of the 7th century BCE, which he himself immediately before illustrates for the same territory of Cupra³⁹⁸⁸ and which, by way of contrast, reinforce Pallottino's conjectural link, suitably supported by Camporeale and most recently quoted by Simone Sisani.³⁹⁸⁹

3The Marches from the seventh to the fifth cent. BCE

Independently from Fermo, above all from the orientalizing phase, cultural influences and exchanges of objects, ideas, and people between the Etruscan and Picene civilizations were always strong and penetrating,³⁹⁹⁰ sometimes not clearly distinguishable from the similar relations with the Latium³⁹⁹¹ and Falisco-Capenate territory;³⁹⁹² apart from Fermo, on the other hand, these relations began for no other reason than through geographical proximity and easy communications already between Novilara and the Villanova culture of Verucchio and Bologna.³⁹⁹³ The recent discoveries at Matelica³⁹⁹⁴ have simply confirmed and significantly increased the evidence of orientalization and, in a startling and unexpected way, have extended a little southward what was already known from the necropolis of Fabriano,³⁹⁹⁵ always along the same inland valley which, parallel to the Appennines, descends from Sassoferrato³⁹⁹⁶ down towards San Severino (Fig. 77.4). Greater light is thereby thrown on the rise of the new social organization in the Picene communities of this geographical sector,³⁹⁹⁷ the nearest to the mountain passes of communication with Umbria:³⁹⁹⁸ an organization dominated by powerful local elites, who are characterized by the prompt adoption of many

of the innovations then drawn from the life style and funerary rituals of the Etruscan and Latin elites, perhaps excluding only writing and the first architectural and town-planning forms.³⁹⁹⁹ The innovations extended from the banquet and symposium, with the serving dishes and equipment necessary for this use, to the two-wheeled chariot for war leaders and women of rank; to furniture, ornaments and weapons of prestige, sometimes enriched with images echoing the mythological world, the epic poems and figurative art spread to Italy from Greece; to the more than probable circulation of master specialists as gifts of friendship between leaders; and to the great dissipation of wealth itself, finally gathered into the tombs together with the sacrifice of the first fruits laid down to propitiate the interments. Two aspects of this important development, well localized and so decisive for the subsequent growth of the whole Picene civilization, should be taken account of here, over and above the individual and indeed numerous imports and imitations of objects that are known by the material evidence: on one side the great adherence of social behavior and rituals highlighted from the burials to those that can be found in the mid-Tyrrhenian coastal strip; on the other side, the absence (until proved otherwise) of similar funerary assemblages, of an equal level and equally widespread, in the corresponding strip of submontane Umbria, to the west of the Appennine ridge.⁴⁰⁰⁰ This can only mean that relations between the peoples of Matelica and Fabriano with the princely orientalizing courts of the southern-Etruscan (and Faliscan and Latin) centers was to a large part direct and of a type definitely not precarious and occasional; much less the product of slow territorial penetration and of reciprocal linked relationships for a more or less commercial purpose. To understand the nature of this better, we could perhaps refer to the massive seasonal migration towards the countryside near Rome and to coastal Lazio, documented for the 16th to 20th centuries CE, but a phenomenon of long standing that has structurally characterized the entire mountain economy of the Marches.⁴⁰⁰¹ The drain, to the final advantage of the Tyrrhenian centers, was not only of human resources — men as mercenaries and women as matrimonial exchanges⁴⁰⁰² — but also of all the products which the princes of Fabriano, Matelica, and, probably, San Severino, exploiting their military force and the strategic geographic position of their respective seats at the center of the region, succeeded in channeling from a good part of the present-day territory of the Marches, as indicated by the now generalized spread of substantially the same orientalizing models of composition of grave goods into the whole Picene civilization from the beginning of the archaic age.⁴⁰⁰³ It is only from the middle of the sixth century BCE and for a further two centuries thereafter that the progressive substitution of figured Attic vases in the symposium services placed in the tombs constitutes a further important cultural innovation, due to the discovery of the landfalls in the Marches, and in particular to that of Numana, on the part of the Greek merchants who sailed up the Adriatic. But this penetration, commercial and cultural, that spread

anew to the entire region of the Marches, even if with less intensity in the district of Ascoli, did not happen independently from that similar and more traditional from Etruria, which continues to suggest ‘the Etruscan material insight of the dead in the tomb’⁴⁰⁰⁴ and to ensure — both from the Tiber area (with Orvieto at the head⁴⁰⁰⁵) and later, also through maritime routes, from the area of the Po — that the more prominent families of the Picene communities (as also the Greeks) retained the valuable provision of bronze dishes and furnishings necessary for the symposium and banquet and that the devotees frequenting the numerous local cult places had the equally precious bronze votive statuettes (Fig. 77.5).⁴⁰⁰⁶ The principle, however, that ‘the (copy of) imported objects does not imply a cultural attribute and even less an ethnic one of the human group to which it belongs’⁴⁰⁰⁷ remains firm.

4The Marches from the fourth to the first cent. BCE

Inasmuch as Pliny's explicit record of the Etruscans, who replaced the Umbrians and were hunted by the Gauls, along the coast to the north of Ancona (Plin. *HN* 3.14.112) has no certain archaeological verification in the stretch of the Marches,⁴⁰⁰⁸ until the Roman period the two problematic cases of Fermo and the maritime sanctuary of Cupra remain the only cases from which we can infer, with some certainty or plausibility and on the basis of precise archaeological documentation and historical evidence,⁴⁰⁰⁹ the real and more or less stable presence of Etruscans in the Marches.

In the treacherous field of toponymy, in fact, the names *Rasenna*⁴⁰¹⁰ and *Rasenanus*⁴⁰¹¹, respectively of a lost locality near Visso and of a late-mediaeval *fundus* in the hinterland of Numana, undoubtedly constitute the trace of the ethnic naming of the Etruscans, but remain locally undatable as to origin and devoid of a known context of reference, having in any case both passed through a process of ‘Umbrianization’, like the greater part of the similar names in *-ēno* / *-ēna* / *-enna*⁴⁰¹² of the Italian peninsula.

We need, therefore, to go to the middle of the first century BCE to find an Etruscan, in the Etruscan-Latin funeral inscription of Pesaro:⁴⁰¹³ *Laris Cafates*, perhaps a Tarquinian or a Perugian, was a soothsayer, who was therefore able to exercise his profession even without a minority of his own ethnic group in the city where he died (Fig. 77.6).⁴⁰¹⁴

Fig. 77.6: Etruscan-Latin funeral inscription from Pesaro. First cent. BCE. Pesaro, Musei Oliveriani (photo courtesy Biblioteca-Musei Oliveriani, Pesaro)

Instead, problems of interpretation remains unanswered for the previous period of the Romanization of the *ager Gallicus*:

- the participation of Etruscans at the battle of Sentino as allied with Galli and Samnites, which, while attested by a number of sources (Duris, *FGrH* II A, F 56, 151; Tzetz., *ad Lycophr. Alex.* 1318) and remaining plausible from the quantity of their goldwork,⁴⁰¹⁵ bronzes and pottery⁴⁰¹⁶ in the tombs of the Senoni, has come to be denied by many historians;⁴⁰¹⁷
- the ethnic belonging of the wearer, in the sepulcher of Monte Rolo, of the helmet of Montefortino type with the inscription *mi spural*⁴⁰¹⁸, indicating for Sisani only the public provision on the part of an Etruscan city to one of the *soci* of the Roman army of Manius Curius Dentatus;⁴⁰¹⁹
- the presence in a *villa rustica*, in the surroundings of *Ostra*, of individuals coming from Chiusi, responsible for the Etruscan graffiti *θve* on the edge of a dolium of scattered provenance;⁴⁰²⁰
- finally the very recent identification of an Etruscan by now romanized, also probably originary from the countryside of Chiusi, in the inscription on a

78Lombardy

Abstract: During the Final Bronze and Early Iron Ages present-day Lombardy was divided into three distinct cultural entities. In western Lombardy, from Serio and Adda to Ticino, was the Golasecca culture, which also spanned eastern Piedmont and southern Switzerland (geographically, an Italian region). Como and Golasecca-Sesto Calende-Castelletto Ticino were the two main centers of this area. Pre-Alpine and Alpine valleys of the provinces of Brescia and Sondrio belonged to a cultural context which can only be adequately defined starting from the sixth century BCE with the facies Breno-Dos dell'Arca. The rock art of Valcamonica and Valtellina is the main source of knowledge for this area. Finally, the plain crossed by the Oglio, Chiese and Mincio rivers was affected by a succession of peoples and cultures. In the Final Bronze Age a cultural group closely related to the so-called Proto-Venetian is documented, as shown by the finds of Casalmoro along the Chiese and Sacca di Goito along the Mincio. In the ninth and eighth centuries, Paleo-venetian cultural aspects are present at Castellazzo della Garolda, Castiglione Mantovano and Valeggio sul Mincio, but they are also attested by stray finds scattered all over the area. During the seventh century an initial spreading of Etruscan cultural aspects along the Oglio river can be detected, while from the mid-sixth century a broader phenomenon of Etruscan colonization took place along the Mincio river, with the foundation of Forcello of Bagnolo S. Vito and other smaller settlements. The fifth century represents the most flourishing period of this part of Padan Etruria to the north of the Po. Following the Gaulish invasion of 388 BCE, the Cenomani occupied the plain from Brescia to Verona and the town of Forcello was abandoned, but the Etruscans maintained control over the lower course of the Mincio and founded Mantua.

Keywords: Golasecca, Valcamonica, Valtellina, Forcello, Mantua

Introduction

During the Final Bronze and Early Iron Ages present-day Lombardy was divided into three distinct cultural entities. In western Lombardy, from Serio and Adda to Ticino, was the Golasecca culture, which also spanned eastern Piedmont and southern Switzerland (geographically, an Italian region). Como and Golasecca-Sesto Calende-Castelletto Ticino were the two main centers of this area. Pre-Alpine and Alpine valleys of the provinces of Brescia and Sondrio belonged to a cultural context which can only be adequately defined starting from the sixth century BCE with the facies Breno-Dos dell'Arca. The rock art of Valcamonica and Valtellina is the main source of knowledge for this area. Finally, the plain crossed by the Oglio, Chiese and Mincio Rivers was affected by a succession of peoples and cultures (Fig. 78.1). In the Final Bronze Age a cultural group closely related to the so-called Proto-Venetian is documented, as shown by the finds of Casalmoro along the Chiese and Sacca

di Goito along the Mincio. In the ninth and eighth centuries, Paleovenetian cultural aspects are present at Castellazzo della Garolda, Castiglione Mantovano and Valeggio sul Mincio, but they are also attested by stray finds scattered all over the area. During the seventh century an initial spreading of Etruscan cultural aspects along the Oglio River can be detected, while from the mid-sixth century a broader phenomenon of Etruscan colonization took place along the Mincio River, with the foundation of Forcello of Bagnolo S. Vito and other smaller settlements. The fifth century represents the most flourishing period of this part of Etruria to the north of the Po. Following the Gaulish invasion of 388 BCE, the Cenomani occupied the plain from Brescia to Verona and the town of Forcello was abandoned, but the Etruscans maintained control over the lower course of the Mincio and founded Mantua.

1From the ninth to the early seventh century

From the ninth and particularly from the eighth century Villanovan artifacts are found in the territories to the north of the Po river, including crested helmets, antennae swords of the Tarquinia type or its variants, Veio type horse bits, razors, Bambolo type end-winged axes, San Francesco and Cortona type socketed axes, thickened bow fibulae with large catch-plate, small fibulae with a lowered bow of the San Vitale type, leech fibulae with large catch-plate, and elliptical bronze-sheet belt plaques. In some cases they are probably local productions that closely recall the Villanovan models. Villanovan (or Villanovan type) artifacts spread over a wide area, encompassing all the territories to the north of the Po, even if a greater concentration is discernible in the Alpine sector of the Adige valley.⁴⁰²² These finds demonstrate the interest Villanovan Etruscans had in establishing relations with the northern and Alpine territories. Soon after, however, with the rise of the first protourban center in the district of Como,⁴⁰²³ trade and contacts, which originated in Bologna, were directed towards this area. Thanks to its geographical position, Bologna played a central role in trade towards the north.

Some finds provide evidence of the relationships between Bologna and Como in the eighth century. From the settlement on the outskirts of Como comes a fragment of an elliptical Villanovan belt plaque. In the tomb of the Vigna di Mezzo at Rondineto, whose grave goods have scarcely survived, there were two twisted horse bits, a pin with a conical head similar to the Melenzani type, the fragment of a sheet-bronze amphora decorated with rows of large and very small bosses – probably attributable to the Veii-Gevelinghausen group (Figs. 44.1 and 44.2) –, and a bronze bident that Giovanni Colonna has connected with the Etruscan world.⁴⁰²⁴ In the grave-goods of a tomb discovered in 1871 in the area in front of the Villa Giovio at Breccia (Como) a small boot-shaped vase of the Bologna-Vetulonia-Veii type was found.⁴⁰²⁵ The wagon burial discovered in 1950 at the Ca' Morta is dated to the Early Orientalizing period (late eighth – early seventh century). The bronze cast angle-sockets of the two-wheeled chariot comes from beyond the Apennines, the bronze socketed axe belongs to the San Francesco type, the dipper with lever handle is attributable to a Villanovan type of Bologna, the bronze-sheet amphora belongs to the Veii-Gevelinghausen group, two bronze flat-ribbed bowls – one mounted on a *Kesselwagen* – certainly come from Vetulonia.⁴⁰²⁶ The same type of Etruscan bowl has been discovered to the north of the Alps in the tombs of Frankfurt Stadtwald, Poiseul-la-Ville and Appenwihr (Fig. 44.1).⁴⁰²⁷ Thus, the Golasecca culture began to act as intermediary between Bologna and the Etruscan world on one side and the western Hallstatt area on the other. For this period, it is not yet possible to precisely reconstruct trade routes because of the scarcity and scattered nature of the finds.

2From the seventh to the mid-sixth century

The relationship between the Etruscans and the Golasecca culture people intensified from the second quarter of the seventh century. The main role was no longer played by Como, but by the “proto-urban” area of Golasecca-Sesto Calende-Castelletto Ticino. The oldest object that documents direct contact with Bologna is an Arnoaldi type bronze knife, characteristic of the Villanovan IV B1 period⁴⁰²⁸, unfortunately now without context.⁴⁰²⁹ Later, with the mid and late seventh century, the materials become more abundant. We can mention a situla with crescent-shaped attachment-plates and a “light” bucchero *kylix* of Tom Rasmussen’s 1-c type from Golasecca,⁴⁰³⁰ the greaves of Archaic Greek type from the “First Warrior” tomb of Sesto Calende,⁴⁰³¹ the large bucceroid impasto *kyathos* decorated with Orientalizing animalistic friezes from Sesto Calende (San Giorgio area) of Vetulonian manufacture,⁴⁰³² the double sheet-bronze basin decorated with lions with wide open jaws and winged sphinxes from the tomb of Castelletto Ticino-Motto Fontanile, also of Vetulonian manufacture (Fig. 81.4). Some grave goods of the latter tomb survived, including a bronze ribbed cylindrical bucket (It. *cista a cordoni*) of local manufacture and a clay beaker with a globular body decorated with helical grooves, while the fragment of an iron multi-head pin (Ger. *Mehrkopfnadel*, It. *spillone a globetti*), now lost, assures us it was a male burial.⁴⁰³³

Nothing similar can be documented for the Golasecca I C tombs of the cemeteries located around Como, in particular at the Ca’ Morta. Therefore, it seems that the new “proto-urban” center of Golasecca-Sesto Calende-Castelletto Ticino had assumed a leading role in the management of trade and relations with the Etruscan world. Direct contact with Bologna is evident, but other considerations suggest that another route was active, leading from northern Etruria to the Golasecca area without the mediation of Bologna, and thus passing through the Ligurian territory. During phase Golasecca I C at Golasecca – but not at Como – the first epigraphic records appeared. The cup of Sesto Calende (Presualdo area) was discovered in 1937,⁴⁰³⁴ an inscription is on the interior of a bowl from the Bellini collection,⁴⁰³⁵ and an inscription carved on stone was discovered in the settlement of Castelletto Ticino, Belvedere area.⁴⁰³⁶ To this we can add the inscription of Montmorot (Jura), inscribed on a Hallstatt ceramic fragment, while its palaeographic Lepontic characters must be considered as made by a person from the area of Golasecca.⁴⁰³⁷ In the subsequent Golasecca II phase, the presence of Lepontic epigraphic documents is still restricted to the Golasecca-Sesto Calende-Castelletto Ticino area. Among the most important is an inscription on the beaker from tomb no.12/1993 at Presualdo, which dates to the G. II A,⁴⁰³⁸ an inscription on the beaker of tomb no. 5 of via Aronco at Castelletto Ticino, and the stele of Vergiate, a stray find and therefore without context, but hardly dating to a period later than the end of the sixth century.⁴⁰³⁹ As Colonna

pointed out long ago, writing did not reach Golasecca via northern Etruria – Bologna – Ticino, but followed a more western route, Southern Etruria – Northern Etruria – Ligurian territory – Golasecca, as shown by the concurrent presence in the most ancient Lepontic epigraphy of the circular dotted theta and of the sigma with four or six strokes, as well as by the inscription of Vergiate, written within two horseshoe-shaped lines, which recalls patterns of the Sienese-Volterranean area.⁴⁰⁴⁰

Concurrently with the increase in Etruscan imports at the center of Castelletto Ticino, in the plain between Brescia and the Oglio River tombs and settlements related to a new cultural facies appeared. This facies is not yet well-known, but its appearance seems to be a direct consequence of the expansion of the Etruscans of Bologna in the direction of the Panaro and Enza and towards the Po during the Villanovan IV B1 and IV B2. The finds – unfortunately all recovered in the nineteenth century, when the scientific excavations were not yet the norm, or gathered from surface ground during archaeological surveys – cluster between Chiese and Oglio Rivers, and seem to attest to an Etruscan penetration to the north of the Po along the course of the Oglio, probably because the Mincio territory was still firmly controlled by Palaeo-Venetian people.

In the municipality of Leno traces of settlements have been discovered in two nearby locations, Madonna della Stalla and Cascina Fornasetta⁴⁰⁴¹. From Quinzano d'Oglio come a few fragments of a large amphora decorated with fish scales (“Anforoni Squamati Group”) of Caeretan manufacture dating to the late seventh century,⁴⁰⁴² and from Castel Goffredo comes a bucchero *kylix* of Rasmussen's type 3b (late seventh– early sixth century).⁴⁰⁴³ The most significant discoveries – but also the most problematic – were made at Remedello Sotto in November 1885 during the excavations carried out by Giovanni Bandieri.⁴⁰⁴⁴ According to his unpublished report, in the area between the Gaulish necropolis to the north and the Eneolithic necropolis to the south two rectangular pit-graves were discovered, oriented east-west, with a bench placed along the two short sides and the deceased buried in the supine position. A few meters further west, on the bottom of a large north-south oriented pit, three heaps of broken pottery were found at a distance of approximately 4 m from each other. The pottery is characterized by a light gray impasto and a smooth black surface similar to that of bucchero; forms include *oinochoai* with a burnished decoration on the shoulder, *olpai*, *kantharoi* with high strap handles of Rasmussen's 3e type but having a high ridged stem, *kylikes* with a deep carinated bowl resembling the Greek forms of the second quarter of the sixth century, triple hemispherical bowls with a triple stem. Finally, there are the remains of six large unusually shaped vases. The body of each vase is decorated with horizontal cordons, the wide and rounded shoulder has large vertical swellings interspersed with triangular spouts, the bottom of the vase is hollow and is joined to a high cone-truncated cordoned foot, which is completely hollow (Fig. 78.2). These vessels were

probably covered by lids decorated with large vertical swellings and a high foot with four curved stems and provided with a small globular vase at the top. Certainly these vessels had no practical functions in everyday life, but they must have been used for religious ceremonies or special rites of purification, being comparable to *thymiateria* or very elaborate and complex incense burners. The finds also included a clay statuette of a praying man or offering bearer almost 20 cm high, with a thick stem 8 cm long meant to be inserted into a support of some sort, a fragment of another very similar statuette and an elliptical support with three hollow vertical cylindrical elements, into which statuettes could probably be affixed. The interpretation of the complex of Remedello Sotto is problematic from several points of view. Two burials are too few to constitute a necropolis. The presence of so many incense burners suggests that it was a sacred area connected to purification rites and to two exceptional burials. In a brief dig test carried out by Lawrence H. Barfield in 1986 about 120 m north-west of the excavation by Bandieri a circular ditch was discovered, with a diameter of 10 m and a V shaped profile, intersected by other two pits. The fill contained pottery dating to the early decades of the sixth century, including a complete *oinochoe*. Unfortunately this excavation has remained unpublished, but it shows that the complex described above was, in fact, larger and dates to the period of Etruscan expansion in the Po valley.

Fig. 78.2: Remedello Sotto (Brescia), selection of figurine and pots discovered in 1885. Late 7th – first half 6th cent. BCE. Museo Patrio di Antichità, Reggio Emilia (Drawings by A. C. Cattaneo)

From the area of the Eneolithic, Final Bronze and Gaulish necropolis of Fontanella Mantovana, about 10 km to the south-west of Remedello Sotto, come incense burners similar to those of Remedello, but simpler in shape and certainly more recent. Three hollow-bottomed cordoned *ollae*, five hollow cordoned truncated-cone feet, and two lids with a cordoned stem ending with a small globular vase, also hollow, have survived.⁴⁰⁴⁵ Excavation data is completely missing.

Despite their problematic nature – largely due to the lack of scientific investigations –, the finds of the territory between Chiese and Oglio, all dated to the end of seventh century / first half of the sixth century, testify to the earliest evidence of Etruscan penetration north of the Po. Shortly after the mid-sixth century the Etruscans began a more systematic expansion along the course of the Mincio.

3Forcello of Bagnolo San Vito (Mantua)

The most important Etruscan center north of the Po River in the sixth and fifth centuries was undoubtedly Forcello of Bagnolo San Vito. It was founded shortly after the mid-sixth century within the framework of a process of expansion and reorganization of the Padan Etruria in conjunction with the foundation of Marzabotto and Spina and the urbanization of Felsina, as well as the foundation of several other minor centers in central-western Emilia and along the Po of Adria.

Forcello is located a few kilometers south-east of Mantua, close to the right morphological escarpment of the paleo-bed of the Mincio River, on a small mound where the gravely alluvium ends and the sandy-silty one of the lower course of the river begins. Paleo-ecological research conducted since 2008 by Cesare Ravazzi and his team has allowed us to reconstruct the characteristics of the environment at the time of the settlement's foundation.⁴⁰⁴⁶ A series of coring undertaken both in the area of the settlement and 100 m further east in the paleo-valley of the Mincio up to a depth of 4 m revealed a sequence of fluvial sands, followed around the fourteenth-thirteenth centuries BCE by peaty deposits of palustrine origin and, starting from the eighth-seventh centuries, by lacustrine sediments rich in freshwater mollusks and almost 2 m thick.⁴⁰⁴⁷ Forcello, therefore, was founded on the banks of a lake that stretched from Pietole to Roncoferraro for more than 5 km, which in front of the settlement was almost 2 km wide. The lake of Bagnolo was still active in Roman and medieval times, as evidenced by the radiocarbon dating of the cores and historical sources. It was gradually reclaimed thanks to the hydraulic works of the Pitentino (1188–1190 CE), which led to the current layout of Mantua's lakes, and then with the embankments of the lower reaches of the Mincio in the early sixteenth century CE.⁴⁰⁴⁸

The location was chosen because it was favorable to river trade and for the presence of an elongated rise, stretching for about 1 km in a northwest-southeast direction and with a maximum width of 500 m, which at the time of the arrival of the Etruscan settlers must have had a maximum height of 14.8 masl, while the water level of the lake must have been approximately 13.6 m. The mound on which Etruscan Mantua rose in the fourth century had a greater elevation only in a few points – approximately 1 m –, but was considerably smaller in size.

The Etruscan city of Forcello, so far unnamed, had a triangular shape, with a 460 m long base oriented northeast-southwest, a 550 m perpendicular height, and with the tip located to the southeast. At this important archaeological site, discovered in 1979, research and excavations have been carried out for over thirty years. From mechanical and geophysical investigations conducted in 1980, 1981 and 1983 and from surface collections it has been possible to determine that the settlement stretched around 12–13 ha. Like all newly founded centers, Forcello seems to have had a regular urban structure, orthogonal and planned from the beginning. In fact, every dwelling excavated so far – even those that belong to different chronological phases – are always oriented northeast-southwest. They are parallel to the northwestern rampart and perpendicular to what must have been the main road, 15 m wide, that crossed the entire town with a southeast-northwest orientation, and ended exactly in the middle of the north-western side.⁴⁰⁴⁹

It is very difficult to read the Forcello's stratigraphy due to the building materials used. In the absence of stone, which is totally lacking in the low plain, houses were built of perishable material, such as wood, reeds, straw, unfired and sun-dried clay, and mostly carbonate silt. Following the natural collapse or catastrophic events (frequent fires), the houses underwent periodic maintenance and reconstruction works, leaving difficult to read stratigraphy.

The geomorphological setting of the area – located within a broad basin that was formed at that point by the paleo-valley of the Mincio River – certainly enhanced the potential of the settlement as a river port but also exposed it to the danger of periodic flooding. Therefore, to defend the town against these events, it was bounded and protected by an embankment, an *agger terreus*, well-preserved along the northwest side of the settlement (where it is 8 m wide at the base), which was surmounted by a wooden palisade on top and another along its external front. Following episodic floods, the earthwork was periodically rebuilt throughout the settlement's existence.⁴⁰⁵⁰

On the other two sides, the existence of a rampart is recognizable through the slight undulation of the ground, although less markedly than along the northwestern side, where a clear morphological escarpment had preserved.⁴⁰⁵¹ Some time during the first half of the fifth century, probably around 480/475, there was a major flood. The waters of the Mincio River overflowed the embankment, depositing 60 cm of sand well inside the settlement. Following

this flood, a new embankment was built from mud bricks further back but also higher by about a meter, because in the meantime an anthropic layer had already formed, significantly raising the level of the settlement.

Inside the settlement or on its outskirts there had to be a religious building or a cult place of some sort, that might be found in the south-easternmost part. The evidence of this consists of a fragment of a pillar altar made of trachyte and an inscription incised on the underside of an Attic black-glazed *skyphos*, both found in area V 10–11.⁴⁰⁵² The inscription bears a formula that forbids appropriation (*ei menpe kape mi pr [---] aitush*), and is traced in an “italicizing” writing style, which according to Adriano Maggiani was used in sanctuaries during the fifth century. Also in the same area a small clay female head of probable Greek manufacture was found.⁴⁰⁵³ To the northeast the base of a bowl was collected on the surface after plowing. The inner surface of the foot of the bowl bears a bimembral onomastic inscription made before firing (*anthush.markeš*); the binomial formula with forename and *gentilicium* and the impression before firing demonstrate the particular importance of the person and the votive character of the inscription.⁴⁰⁵⁴ Many schematic figurines of worshippers, cast or cut from a bronze sheet, have been found at Forcello in area R–S 17–18 and belong to different phases of the settlement’s history.⁴⁰⁵⁵ They come from fillings or “bonifica” layers, and thus have a secondary provenance, but in some cases they were recovered from primary contexts, like the cast bronze figurine found in room 1 of house F II, dated to the late sixth – early fifth century.

What makes Forcello unique among the centers of Padan Etruria is the thickness of its archaeological stratification, which reaches up to 2 m and refers to several chronological phases, corresponding to phases of construction, destruction and reconstruction of dwellings. Excavations carried out in the center of the settlement (areas Q–R–S 17–18–19), which in some places reached the undisturbed soil and therefore the period of foundation, have revealed a sequence of nine main phases, labeled with letters from the top (phase A, the most recent) down (phase I, the oldest).⁴⁰⁵⁶

During the settlement’s history extensive fires occurred, destroying the houses, particularly in phases F and C. In both cases, the destruction and collapse layer was sealed by sterile clay or waste materials, used to reclaim the area and create a new ground level on which dwellings could be rebuilt. Because of this all the materials that were present in the houses have been preserved *in situ*, albeit heavily fragmented and often warped by the heat of fire. This is therefore a lucky and rare example of material found in a primary context. The collapse layer pertaining to the phase F is the better investigated one. Currently, another important collapse layer is under excavation, referring to phase C (second quarter of the fifth century), a few meters away from the houses of phase F.

Little has been known about phase I until now. Phase I coincides with foundation (around 540–530) and it is dated by fragments of Little Masters

band cups and *lekythoi* (third quarter of the sixth century). During phase H, which yielded fragments of Cassel cups (530–520), an outdoor workshop with facilities for smelting and metalworking was active in area R18, replaced in phase G by a large house, which has been investigated over an area of approximately 90 sq m. Phase G yielded a black-figured *lekythos* attributed to the Cock Group (around 520–510), which had been reused in the drainage feature for the hearth. Not long after, the building of phase G was dismantled, and the area was cleaned and levelled by laying a silty layer on top of which the houses of phase F were rebuilt with an identical layout. Destroyed by fire shortly after 500, the debris were sealed under a thick sterile clay layer, on which an outdoor craft area was created with numerous hearths and even more numerous small pit forges for metalworking (phase E, around 495–485).

In the area surrounding the pit forges and the hearths, iron slags and scraps, bronze chips, small sheets, small bronze bars and ingots, fragments of tuyères and moulds, and deer-horn chisels and gouges were found. After the ground was levelled again, a new house was built (phase D), with a layout different from that of the previous phases, whose structure is very poorly preserved. After it was dismantled, the phase C house was built (around 475–450), measuring 12.3×5.2 m, whose perimeter is defined by large postholes. The house comprises a large room that is 10 m long and a smaller one, separated by a wooden partition. The first room features a central fireplace and, on the northwestern side, a vertical loom, whose existence is attested by the discovery of 150 loom weights. In the house were found 186 oval bodied *ollae*, containing charred fava beans, wheat, barley, lentils and peas. This building, which was perhaps used as a workshop and storeroom, was also destroyed by a massive fire, the remains of which were sealed with a layer of earth and waste materials.

The latest phases (A–B), almost completely destroyed by agricultural work, have yielded only fragments of floors, hearths, slots for timbers that supported mud brick walls and tiled roofs, as documented by the discovery of fragments of semi-cylindrical tiles, sometimes painted, and the remains of an antefix.⁴⁰⁵⁷

The houses were rectangular and had internal wooden partitions, resting on foundation timbers housed in slots. Most houses had rammed clay floors, but were sometimes made of hard silt. Roofs must have been double-pitched, and, except for during the latest phases, covered with thatch. Inside the houses were one or more hearths, mostly located in the center of the rooms and consisting of pits lined with insulating materials such as shards, pebbles, stones and a layer of clay and silt. During phases D, F and G, dwellings were built entirely of wood, probably with the *Blockbau* technique, although some walls of the phase F structures were made of wattle and daub. In phase C, the large postholes and large amount of fired daub with wattle impressions show that the load-bearing structures were made of by wooden poles supporting the roof and wattle and daub walls (*parietes craticii*).

3.1 Phase F

The investigation of phase F in areas Q–R–S 18–19 ended during the 2011 excavation campaign, when the perimeters, covering a total area of 450 m², of two houses were brought to light. House F I was an aristocratic residence, and although the other house contained a wealth of imported objects, it included a workshop for coral working, spinning and weaving and honey collection from the hives, as evidenced by the discovery of great amounts of bee bread and remains of honeycombs (F II).⁴⁰⁵⁸

Along the northeastern and southwestern sides, the complex of the two houses was delimited by channels, that sloped from northwest to southeast, and that ran into a channel bordering the southeastern side. Their function was to drain and discharge rainwater and sewage. The southeastern channel most likely ran into the pair of large channels of the main road that crossed the entire town, which was 15 m wide and oriented northwest-southeast. Houses F I and F II were separated by a channel 2.0 to 2.4 m wide, which also sloped northwest-southeast and ran into the southeastern channel (Fig. 78.3).

A passageway flanked the northwestern side of the two houses which has been only partially excavated. The passage along the southeastern side was smaller and overlooked the channel that flew toward the major road of the settlement. The two houses covered an area of 275 sq m, and considering also the channel that divided them, the extension of the housing complex reached 314 sq m.

House F I is made up of five rectangular rooms, arranged next to each other and with the major axis oriented northeast-southwest; each room was flanked along the two short sides by smaller rectangular rooms, which were service or storerooms. The entrance must have been on the northwestern side. All large rooms except one were equipped with a hearth, located in the center in two cases and against the wall in the other two which included the southeasternmost room most likely the kitchen. The whole house covered an area of 175 sq m.

The number, shape and size of the rooms differentiate house F II from F I, as does in part the building technique. House F II was made up of a large rectangular room located to the northwest, that covered an area of almost 50 m², and whose southwestern side yielded collapsed fired daub with many wattle impressions; a large room of 38 m², with a centrally placed hearth of 2.1 × 1.8 m (the largest in the entire phase F complex); and a smaller service room to the southeast. The whole house is 100 sq m in extent. The floors in the biggest room seem to have been used as work-surfaces, being very blackened in parts, burnt and reddened in others. The ditch that borders the northwestern short side of the house features a series of postholes along, arranged regularly, at intervals of 85 cm.

Fig. 78.3: Forcello. 1. Digitized plan of the phase F in areas Q-R-S 18–19

The connection between the two houses is still unclear as it is still unknown – although it seems likely – whether they formed a single functional unit, a real aristocratic *oikos*.

At Marzabotto, a center perfectly contemporary with Forcello, the houses had a front section of about 180 sq m, divided into various rooms of different sizes, and a broader rear section with a central cruciform courtyard, equipped with a well and flanking rooms. So far no comparison has been found for the model offered by the settlement at Forcello for the late sixth century, and therefore it constitutes both a valuable document for understanding Etruscan domestic architecture and an interesting case study.⁴⁰⁵⁹

The aristocratic character of the phase F houses is shown by their size and layout, as well as by the quality and quantity of materials recovered. In addition to large amounts of fine tableware (bowls, small plates, large and deep bowls, footed vases, *olpai*, jugs), kitchenware and storage vessels characterized by a coarse-grained *impasto* – globular and ovoid *ollae*, large cordoned vases, cordoned *dolii*, cooking pots with and without inner flange, lids, two stoves –, a large quantity of Greek pottery was recovered. In room 11

of house F I was a black-figured column *krater*, attributable to the Leagros Group, dated to the late sixth century. On its primary side it depicts the scene of Achilles ambushing Troilos and Polyxena, who runs away leaving her *hydria*, and on its secondary side Dionysos with a procession of satyrs and maenads.⁴⁰⁶⁰ There were also some type C *kylikes* belonging to the *Frühgruppe* after Bloesch, and three *lekythoi*, one referable to the Cock Group and one with opposite palmettes separated by a braid. Other type C *kylikes* were found in the house, particularly in room 3, while a black-figured *lekythos* of the Class of Athens 581/I, with two hoplites and two women wrapped in their mantles, comes from room 4, the kitchen. Also found in the house F I were seven Greek trade amphorae and one fractional amphora. Three Thasian amphorae, of the type Silenus Gate after Grandjean (1992), and one fractional amphora were found between rooms 8 and 11 and the service room 9, where there were also a Corinthian B amphora and an Ionian-Massaliote amphora. Another Thasian amphora was in room 3 and the fragments of a second Corinthian amphora were scattered on the floor between the service room 1 and 9.⁴⁰⁶¹ Among the highly valuable materials should be mentioned a silver fibula coated with gold leaf, of the type with the bow sloping towards the catch-plate, which was found in room 11,⁴⁰⁶² and a green jasper scarab of Greek-Cypriot manufacture from room 8.⁴⁰⁶³ The basal face bears an engraved depiction of the god Bes facing a lion. The scarab is perforated along its length by a hole through which a gold or silver thread must have passed forming a swivel setting, and must have hung around the neck. It was used as a seal to be impressed on wax or unbaked clay, as a sign of possession or a real signature. Traces of a prolonged use indicate that he had perhaps been handed down from father to son for a couple of generations.

In the kitchen (room 4) a stove, four querns and three grinders made of trachyte from the Euganean Hills, an iron knife, a mortar, a Paleovenetian small olla and the black-figured *lekythos* were found. In the adjacent service room, a lot of ring-shaped loom weights and several oval bodied storage jars mainly containing broad bean seeds (*Vicia faba minor*) were found.

The large rectangular room of house F II yielded a considerable amount of truncated pyramid shaped loom weights, hundreds of unworked coral branches, a tall pedestalled Paleovenetian bowl decorated with horizontal red-and black-painted bands separated by narrow cordons. From the room with the large fireplace in the center and the adjacent service area come another Thasian transport amphora of the type “Silenus Gate”, a black-figured eye-cup with a jumping leveret depicted on both sides, a Heron-Class *skyphos*, some black-glazed cups of the Bloesch C type, the fragments of a black-figured *lekythos* with the figure of a hoplite, an *amphoriskos* decorated in the Fikellura style, numerous small stemmed plates with a broad horizontal rim and an overpainted decoration on the interior, a Paleovenetian cup with an up-raised handle.

The bronze artifacts are often unrecognizable, having been melted in whole

or in part. A fragment of a twisted handle testifies to the presence of a *situla* or a cist in the kitchen of house F I. From room 1 of house F II comes the fragment of a votive bronze figurine, from the service room 6 of house F I a rectangular belt buckle. Fibulae were found in almost every rooms, including Certosa type fibulae, fibulae with the bow sloping towards the catch-plate, serpentine and leech fibulae. They all belong to the Este III middle – Golasecca II B chronological horizon.

Once the restoration and study of the large number of recovered artifacts is complete, it will be possible to better define the function of the rooms on the basis of the materials found *in situ*, in their original locations.

Thanks to the analysis of the retrieved animal remains, and of the seeds, fruits and charcoal, the study of the primary economy is under way, but preliminary results are already available. Ninety-nine percent of paleobotanical remains belong to cultivated species, including the already mentioned broad beans, and foxtail millet, millet, emmer, spelt, bread wheat, barley, oat, rye, lentils, peas, legumes and indeterminate cereals. The discovery of several cloves of garlic (*Allium sativum* L.) that have preserved by charring in fire is exceptional.⁴⁰⁶⁴ The discovery of an olive pit suggests that one or more Greek transport amphorae contained olives instead of wine. Among the faunal remains the pig predominates, but the bones of cattle, goat, sheep, fish vertebrae (especially pike) and bones of domesticated fowl, probably chicken, are also present.⁴⁰⁶⁵

Approximately half a century later than phase F, phase C is also characterized by levels of collapse caused by fire and sealed by layers of clay or debris. In 1983 and 1985 a house was excavated in area R 18, which was called the “house of loom weights”;⁴⁰⁶⁶ more recently, another dwelling has been unearthed in area R 19, and finally in September 2011 the excavation of another structure in area R 17 began. Here, a 80 sq m surface pertaining to a house destroyed by fire was exposed. After the removal of the remains of the collapsed wattle and daub walls, a gray-black carbonaceous layer emerged, resting directly on the dwelling’s living surface. Both the collapse and carbonaceous layers contained a lot of materials, in particular sherds, many of which pertain to Attic red-figured and black-glazed vessels. Of the over 1000 fragments of Attic pottery recovered so far, about 200 are from a red-figured column *krater*, which has been almost fully reassembled. The rim is flat, the concave-profiled hanging part of the rim is decorated with a stylized ivy pattern. On the neck there is an ornamental frieze of lotus buds linked by stem arcs on one side. Vertical bands decorated with highly stylized ivy patterns frame the two figured body panels. Side A depicts five figures, from left to right: a standing bearded man holding a stick, with a petasus turned back on his shoulders and a cloak that leaves his legs bare, another bearded man sitting on a rock, dressed in the same manner, raising his bent left leg with his hands, and wearing shoes marked with a network pattern; both look to the right and in front of them is a young man, turned to the left, who holds a stick and

seems to be talking to the two bearded men. Next is a young man facing right, with his bare shoulder and the right arm bent, having a conversation with a young man draped in a mantle and turned to the left. On side B is a scene of conversation among three young men. Based on a preliminary assessment, pending the cleaning and restoration, the krater, attributable to the Orchard painter, can be dated around 470–460.

Over 200 fragments, which have been partially joined, belong to a second column krater, larger than the other and attributable either to the Boreas painter (470–460) or the Florence painter (465–450), whom Beazley considered “brothers”. A red-figured cup has been partly reassembled by twenty fragments, it is a late work by Makron (480–470). Other sherds belong to black-glazed cups, including many bowls with thickened rims, rounded on top and projecting outwards, or to skyphoi. Among the skyphoi one is a so-called hybrid and according to comparison with some specimens from the Agorà dates to 480–450. Finally, there was an oinochoe in the form of a female head, which has been assigned to the later production of Group N after Beazley (around 470). The possibility of joining the fragments shows that, after the catastrophic event, all the materials were left *in situ* and sealed by earthen layers. In conclusion the Attic pottery has provided valuable data for the absolute dating of phase C (second quart of the fifth century), to which the burned structure belongs.

3.2 Commercial character of the settlement

The distinct commercial character of Forcello settlement is evidenced by its favorable geographical position at the confluence of two major traffic routes. The first of these was the land route that started from the inland Etruria cities, crossed the Apennines and passed through Marzabotto and Bologna. The other was the sea route that reached the Adriatic from the Aegean sea, took advantage of the ports of Adria and Spina and continued along the waterways to the heart of the Po Valley before heading towards the Alpine passes. The quantity of foreign goods emphasizes the importance of trade activities.

Clear evidence of such long-distance traffic is provided by the large amount of Attic pottery and Greek transport amphorae that have been found from every phase of the settlement. The transport amphorae come from different production centers: there are Thasian, Mendeian, Chian, Samian and Milesian amphorae, amphorae of the so-called Ionian-Massaliote type, Corinthian A, A 1 and B amphorae, “à la brosse” and Solokha I type amphorae (Fig. 78.4).⁴⁰⁶⁷

Corinthian type B amphorae, manufactured at Kerkyra or in Magna Graecia, are present from the earliest to the most recent phases, in the early fourth century. Corinthian A 1 and A amphorae appear from the second quarter of the fifth century. Amphorae “à la brosse” are only documented by a few specimens, some of which refer to phase E, whereas others come from

secondary contexts. Five Thasian storage jars of the “Silenus Gate” type, dating to the late sixth / early fifth century, come from the phase F dwellings. Mendeian amphorae are frequent at Forcello from the mid-fifth century to the early fourth century. Eastern Greek trade amphorae seem to be absent in the earliest phases. The “early bulgy” type Chian amphorae are documented by several specimens dating from the early to mid-fifth century. Samian and Milesian amphorae span from the beginning to the end of the fifth century / early fourth century. Solokha I type amphorae, now related to a southern Aegean center, are attested only in the final phases of the settlement’s life.

Fig. 78.4: Types of Greek trade amphoras from Forcello. 1. Thasian, type Porta del Sileno; 2. Corinthian B; 3–4, Chios, early bulgy type; 5–6, à la brosse; 7. Corinthian B; 8. Chios; 9. Corinthian A; 10. Milesian; 11–12 Solokha 1 type; 13. Samian; 14. Late Mendeian type. Scale: 1/10 nat. size (Drawings by R.C. de Marinis)

Many thousands of Attic pottery fragments were recovered at Forcello. The inventory is not yet complete, but it is nevertheless possible to make some rough estimates. In most cases sherds pertain to non-figured black pottery, mainly *kylikes* and *skyphoi*. The figured pottery represents at least one quarter of the total amount, even if we must consider that it is often not possible to determine whether a fragment came from a figured or a black-glazed vase. Regarding the shapes, *kylikes* are the most frequent, followed by *skyphoi* and kraters, *kantharoi*, *lekythoi*, bowls, small bowls, salt cellars, *lekanai* and *lekanai* lids. There are only a few specimens of *oinochoai* and *olpai*. One fish plate and one black-figured *epinetron* have been recorded so far. Closed forms, like amphorae, *hydriai*, *stamnoi* and *pelikai*, are not documented with certainty. The most common shapes are therefore those used for wine consumption, including cups, *skyphoi* and *kantharoi* for drinking and kraters for mixing wine with water.⁴⁰⁶⁸

The black-figured pottery spans the earlier phases of the settlement, from I to E. Phases H and I yielded fragments of Little Masters, Droop and Kassel cups. The column *krater* of the Leagros Group, the eye cup and the black-figured *lekythoi* of phase F have already been discussed. There are many Floral Band cups, both the oldest types, featuring palmettes with united petals separated by engravings and superposed violet paint (530–500), and the latest types, from phase E or from secondary contexts (500–475). From phase E also comes a fragment of a black-figured krater decorated with a chariot wheel design. A fragment of a band-cup with a satyr head dates to 540–530, a fragment of a Leafless Group cup (490), as well as few specimens of cup-*skyphoi* of the Haimon Group's late production (480–470), were found in secondary contexts.

The first red-figured pottery made its appearance at Forcello in Phase F (late sixth–beginning of fifth century). It consists of a few fragments of a tondo edged with a meander pattern, whose adoption occurred a few years before the end of the sixth century. Several specimens of Archaic red-figured cups that date to around 500 or to the early fifth century, come from phase E or from secondary contexts. Among them stands out for its relevance a cup with a kneeling Scythian archer who is trying an arrow, which can be attributed either to Epiktetos or to Proto-Panaitios (Fig. 78.5). A cup decorated by a courtship scene and attributed to the latest production of Makron (480–470) has already been discussed.

Many fragments of columns, volute and calyx kraters survive from the early Classical period. Among them are some joined sherds that come from a calyx krater with a scene of a duel in front of a fallen warrior, attributable to the group of the Niobid painter (470–460). Several *kylikes* have been found

that belong to the same period and have been attributed to Hermonax, the Telephus painter, the Tarquinia painter or the school of Makron. Unfortunately, these materials come from secondary contexts.

Many fragments of *kylikes* and *skyphoi* of the Classical and late Classical periods have been found among domestic debris or strata from the settlement's later phases. Owl-*skyphoi* and St. Valentin *kantharoi* are also frequent. The latest Attic vases date to the first quarter of the fourth century. Among them we find a *skyphos* of the Fat Boy group.

As for trade and the contacts the Etruscans of Forcello had, we cannot fail to mention the discovery of seventeen Late Hallstatt fibulae and four Early La Tène fibulae.⁴⁰⁶⁹ The Ha D 3 fibulae (*doppel Paukenfibeln*, *Fusszierfibeln* and *doppel Zierfibeln*) belong to phases E, D and C, whereas the La Tène fibulae belong to phases C and B. These fibulae show that Forcello was frequented by Celts coming mainly from Burgundy and southwestern Germany. Golasecca II B and III A pottery and bronze objects attest the relationships with the area of the Golasecca culture, in particular with Como;⁴⁰⁷⁰ some Rhaetian artifacts are also present.

Fig. 78.5: Forcello, phase E. Red-figured cup with figure of a Scythian archer, attributable to Epiktetos or to the proto-Panaitian group. 500–490 BC (Photo by R. C. de Marinis)

3.3 The necropolises

The data is still incomplete concerning funerary rites. In the nineteenth century burials were discovered in several gravel and sand pits in the municipality of Rivalta sul Mincio, including the pit near Corte Collefiorito.⁴⁰⁷¹ In 1877 a tomb was discovered that contained a pedestalled vessel, a bronze arm ring, a silver Certosa fibula, an elliptical belt plaque, as well as other objects that are no longer identifiable. The belt plaque has the same shape of the Este type specimens, but its decoration is completely different: a group of thirty-two compass-drawn concentric circles arranged in vertical rows, are framed by geometric patterns impressed with a punch. The tombs of Rivalta yielded Etruscan-Padan pottery, Certosa fibulae – all dating to the second half of the fifth or early fourth century –, a ring with small globules of the Golasecca III A type, an Attic owl-*skyphos*, a black-glazed *lekythos*, an Attic *oinochoe* in the form of a female head referable to Beazley's T group, a polychrome glass *alabastron*, and a bronze situla of the so-called Rhenish-Ticinese type.

A funerary provenance is to be assumed for the *Schnabelkannen* found at Corte Romane and in the Cavalletto canal, respectively to the southeast and to the southwest of Forcello.⁴⁰⁷² In 2003, three inhumation burials and four cremation tombs were discovered at Ca' Rossina di Bagnolo San Vito, to the south of Forcello. Among the grave goods were a black-figured *lekythos*, Etruscan-Padan pottery, silver serpentine and Certosa fibulae, amber and glass beads.⁴⁰⁷³ In the past, a cremation burial with dolio had been found at Righelli (Bagnolo San Vito). Inhumation burials have been recently discovered at Cerese (Arginotto area) and at San Giorgio Mantovano (Valdaro area).⁴⁰⁷⁴ Further west, at Corte Alta Cerese along the right bank of the river Oglio, an Etruscan inhumation necropolis, that had been largely destroyed by quarrying works, was partly excavated in 1990. Among the materials recovered was an Attic stemless cup with a finely engraved decoration with two rosettes inscribed into each other, dating to the mid-fifth century.⁴⁰⁷⁵ Overall, the funerary evidence indicates that, even if inhumation prevailed, the Etruscans who inhabited the territories to the north of the Po River practiced biritualism, just as in Bologna.

The creation of an important bridgehead to the north of the Po along the course of the Mincio and the foundation of the Genoa's emporium intensified Etruscan trade with the Golasecca culture and north of the Alps with the Celts, through the Alpine passes. In the tombs of Golasecca III A at the Ca' Morta and in other cemeteries around Como we find bronze vessels of Etruscan manufacture (*Schnabelkannen*, stamnos-situlae, basins, *kyathoi*, ribbed cylindrical buckets with fixed handles of Felsinean type) and, in some cases, Attic and Etruscan-Padan pottery.⁴⁰⁷⁶ The stamnos-situlae were used as funerary urns, whereas the *Schnabelkannen* as grave offerings.⁴⁰⁷⁷ In the cemeteries around Bellinzona many *Schnabelkannen* have been found, but

stamnos-situlae are lacking.⁴⁰⁷⁸ In the large proto-historic settlement in the surroundings of Como Attic pottery is relatively frequent, unlike in the graves. At Prestino-via Isonzo (Como) a drachma from Populonia was also found, that belong to the earliest series with the Gorgoneion figure. It probably arrived via the Genoa-Milan-Como route.⁴⁰⁷⁹ The most ancient archaeological stratification in Milan date back to the Golasecca III A and yielded fragments of Attic pottery. The picture of Etruscan imports in the Golasecca culture is completed by a bronze cast socket fitting of a *diphros* from the G. III A cemetery at Cuggiono, a type studied by Alessandro Naso, who suggests that the folding seat in Etruria was a symbol of authority.⁴⁰⁸⁰

4The end of Forcello and the foundation of Mantua

According to the dates of the latest Attic pottery found there, the abandonment of the town of Forcello, whose ancient name is unknown, must have occurred, as for many other centers of the Padan Etruria, in the early decades of the fourth century. The coincidence with the Gaulish invasion of 388 BCE might not be an haphazard circumstance. Unfortunately the upper part of the archaeological deposit has been destroyed by agricultural work and destruction by violence cannot be ascertained. Pliny the Elder comes immediately to mind (Plin. *HN* 3, 125), who relates the dramatic events following the Gaulish invasion. The Etruscan town identified through the archaeological investigations at Forcello might be recognised in the *Melpum opulentia praecipuum* “destroyed by Insubres, Boi and Senones in the same day when Camillus captured Veii”.

The Gaulish invasion led to the collapse of the Padan Etruria, but the lower course of the Mincio remained in the control of the Etruscans, who founded Mantua, *trans Padum Tuscorum sola reliqua* (Plin. *HN* 3, 130), and further south the Castellazzo della Garolda, active throughout the fourth and the first half of the third century. Another contemporary smaller Etruscan center was located on the right bank of the Mincio at Bagnolo San Vito, where the parish church is now located.

The Etruscan city of Mantua covered approximately the same area as the subsequent Roman city, the *parva Mantua* mentioned in the ancient sources. In fact, its size, estimated at approximately 5–6 ha, was smaller than that of Forcello. In all the excavations carried out inside the ancient city (piazza Sordello, piazza Paradiso, Casa del Rigoletto, Vicolo Pace, Palazzo Ducale-Cortile degli Orsi), the virgin soil has always been encountered below the fourth century levels.⁴⁰⁸¹ The only exception is the recent excavation in Santa Barbara square, where older levels were detected.⁴⁰⁸² Materials dating to the fifth century were also recovered in the area known as “gli Angeli”, on the western outskirts of Mantua. Along the entire course of the Mincio towards

the north, there must have been several small centers which marked the stages of the river route.

The excavations carried out in the historic center of Mantua in the last 30 years— unfortunately almost entirely unpublished – have revolutionized our knowledge about the city's origins and have provided valuable information about northern Italian trade during the fourth and third centuries.⁴⁰⁸³

The picture is very different from that of the previous period. Trade with Greece had not been interrupted, but no longer offered the variety and volume known at Forcello. Attic figured pottery was still present, but during the fourth century it was gradually replaced by black-glazed pottery, perhaps imported from Magna Graecia, and still later black-glazed pottery from Volterra became prevalent. Greek transport amphorae were also present, especially the Corinthian A type oil amphorae and the B type wine amphorae. By the early third century the Greek-Italic amphorae of Siceliot or South Italian manufacture appeared, and their massive importation continued throughout the century.⁴⁰⁸⁴

If trade did not lose vitality, its range had certainly shrunk. Upper-Adriatic pottery, produced at Adria or some other center of the Delta, has been found in Mantua. The Po route continued to be used, but sea and river trade declined in favor of land trade, as shown by the massive importation of Volterranean black-glazed pottery, which spread from Mantua to the territories of Cenomani and other Gaulish populations.

The picture offered by Castellazzo della Garolda, along the left bank of the Mincio, is perfectly comparable to that of Mantua.⁴⁰⁸⁵

Old and new finds give us some indication about the necropolis of Etruscan Mantua. A funerary provenance seems certain for the intact Kerch-style bell krater which dates to around 350, and was found in Corridoni street in 1911, 400 meters to the south of the ancient town.⁴⁰⁸⁶ A large burial ground must have been located between the railway station and Mondadori square, about one kilometer east/southeast of the ancient town. A recent discovery of inhumation burials has been reported from Corso Vittorio Emanuele and Mondadori square,⁴⁰⁸⁷ while a red-figured aryballic *lekythos* that dates to the fourth century was retrieved from destroyed graves in the area in front of the railway station. Cremation tombs pertaining to the settlement of Castellazzo della Garolda were discovered in the winter of 1845–6 at Corte Cavriani, 600 meters east of the settlement. Grave goods included pottery and bronze vessels, but only two Attic red-figured bell kraters are currently identifiable. One features a banquet scene, while another is attributable to the late production of the Filottrano painter, with the figures of Perseus holding the Gorgon's head in his right hand and Andromeda seated and crowned by Eros. A second necropolis was located to the west of Castellazzo, at Corte Vivaio. Here, in 1974 numerous inhumation burials were destroyed during the planting of a poplar grove. Among the recovered materials are a bronze *oinochoe* with a carinated body of Etruscan manufacture, a bronze *kyathos*,

fragments of a situla and of a ribbed cylindrical bucket, the foot and the base of an Attic bell krater, and a black-glazed *askos*.⁴⁰⁸⁸

Ceramics bearing inscriptions in the Etruscan alphabet and language come both from Mantua and Castellazzo della Garolda (Fig. 78.6). Castellazzo yielded a full alphabetic sequence incised with firm strokes and a perfect circular *ductus* on the bottom of a bowl that dates to the fourth century.⁴⁰⁸⁹ A Volterranean black-glazed cup found during the excavations carried out in Mantua-piazza Sordello, features an inscription scratched on the inside, *herini*, a family name widely attested at Chiusi and Perugia.⁴⁰⁹⁰ During the excavation of Mantua – Vicolo Pace a gray ware bowl was found that dates to the third century and bears the inscription *eluveitie* incised on its interior. The root “*elu-*” or “*elvo-*” assures us that this is a Celtic name (see the name *Elvorix*).⁴⁰⁹¹ According to Daniele Vitali and Gilbert Kaenel, the possessive case of the name would be formed starting from the ethnonym **Elvet-*, i.e. the name of the Helvetii, the well-known Gaulish tribe.⁴⁰⁹² The excavation of Vicolo Pace yielded also black-glazed cups with the inscription *fukis*, a name whose root corresponds with the Venetic language (*Fugia* and *Fugio-*).⁴⁰⁹³ The inscriptions of Mantua and the territory of the lower course of the Mincio document the persistence of the Etruscans in the area well into the fourth and third centuries, but at the same time reveal the Mantua’s multi-ethnic character, with the presence of people of Celtic and Paleo-venetian origin, accounting for the celebrated verses of Virgil: *Mantua dives avis, sed non genus omnibus unum* (Verg. *Aen.* 10, 201–203).

Fig. 78.6: Black-glazed cup of Volterranean manufacture with the inscription *Herini*, from Mantua, piazza Sordello; 2. black-glazed cup with the inscription *fukis*, from Mantova; 3. grey ware bowl with the inscription *eluveitie*, from Mantua. Scale: 1, 4:5; 2–3, 2:5 (Drawings by R.C. de Marinis)

VI. Etruscans outside Etruria

Etruscan Finds in Italy

Alessandro Naso

79Central Italy and Rome

Abstract: During the first millennium BCE, Central Italy was a mosaic of different peoples, each with its own culture and language. Modern-day Latium was settled by Latins and other minor peoples such as Sabines, Faliscans, Hernici, and Volsci. There were other populations in the adjacent regions, too—Umbrians in Umbria, several tribes in Abruzzo, and Picenes in the Marches. Handicrafts suggest that Etruscans were in touch with their neighbors mostly as traders, although geographic mobility is documented by inscriptions. In the case of inscriptions, individuals of high social rank were granted foreign citizenships at the same social level they had at home. The cultural contacts between Etruscans and their neighbors changed through the ages and were not only one way.

Keywords: Rome, Latium, Faliscan, Umbria, Abruzzo

Introduction

During the first millennium BCE, Central Italy became a mosaic of several peoples with different cultures and languages. In the second half of the millennium, in modern-day Latium, near the Latins who were settled around Rome and on the Alban Hills can be identified other peoples, such as Faliscans in the *ager Faliscus* on the left bank of the Tiber. Sabines were in the mountainous hinterland northeast of Rome around modern-day Rieti, Hernici were between the Lago del Fucino and the Sacco River around modern-day Anagni, and Volsci were in the southeast. There were further populations in the adjacent regions, such as Umbrians in modern-day Umbria and Emilia-Romagna, several tribes in Abruzzo, and Picenes in the Marches (Fig. 79.1).⁴⁰⁹⁴ Handicraft items suggest that Etruscans were in touch with their neighbors mostly as traders, even though geographic mobility can be assumed earlier for particular finds, and is documented later by inscriptions; in the case of inscriptions, we can see that individuals of high social rank were granted foreign citizenship at the same social level. Cultural contact between Etruscans and their neighbors changed through the ages and were initiated on both sides.⁴⁰⁹⁵

1Latium and Rome

Latium is a flat and fertile region, which to the south blends naturally into

Campania. Not by chance did ancient people derive the name *Latium* from the Latin adjective *latus*, meaning “broad, wide.” Eastern mountains border vast plains, which are watered by several rivers, the largest of which generally flow north–south and the lesser of which flow east–west. Both were used in antiquity as natural roads. The most significant river is the Tiber, the river of Rome, which was the northern border of Latium, dividing it from Etruria. The southern boundary is not so clear. In the first century CE, Pliny the Elder called the territory between the Tiber and the Mount Circeo promontory *Latium vetus*, and the region of the Garigliano, Liri, and Sacco Rivers *Latium adiectum*. The river corridor of the Sacco and Liri-Garigliano Valleys was an important natural road to Campania and southern Italy. At its northern access lay the Latin Praeneste, whose flourishing phases benefited from its location.

Fig. 79.1: Ancient Latium and adjacent areas

The role played by the Etruscans (Lat. *Tusci*) in Latium is stressed by literary sources, archaeological finds, and inscriptions. Ancient toponyms—many of which remain in use, such as the city name Tusculum on the Alban Hills—demonstrate the close nature of the relationships with the Latins. Due to the close connections, in Etruscan inscriptions personal names derived from the stem Latine are documented from Veii and Caere, showing geographic mobility from Latium to Etruria.⁴⁰⁹⁶

2The Early Iron Age in Latium (1000–730)

In the Italian Iron Age, the finds from Latium represent a well-defined group, called the Latial culture, which has been periodized into four main phases whose traditional chronology has recently been discussed within the intense debate about the absolute chronology of the Italian Iron Age (see [chapter 33](#) Pacciarelli). The new chronological proposals are earlier than the traditional ones for the Latial culture, too, as shown by direct comparison between the traditional dates and the system suggested by M.Pacciarelli ([Table 1](#)).⁴⁰⁹⁷

Table 1: Dating schemes for Latial culture

	Traditional	Pacciarelli
I	11 th century – 900	12 th century – 950/925
II	900–770	950/925–850/825
III	770–730/725	850/825–730/725
IVA	730/725–640	730/725–640
IVB	640–580	640–580

The four main phases are subdivided into sub-phases, whose chronologies depend largely on the sequences of single sites. Phase II is actually better known than phase III. It probably depends on the state of publication of the respective finds. The cemetery of Osteria dell’Osa, near Gabii (east of Rome, along the Via Prenestina), belonging mostly to phase II, has been published, while the cemetery of Castel di Decima near Decima (south of Rome, along the Via Pontina) has not, for the most part.⁴⁰⁹⁸ What is clear in the sequence is the end date. After 580, archaeological evidence from cemeteries is lacking, because in Rome and Latium people were buried without grave goods, probably because of funerary laws. Therefore one has to work with other archaeological sources, such as architectural terra-cotta decoration of buildings.

In the early Iron Age, some cultural elements, such as proto-urban settlement patterns⁴⁰⁹⁹ and relationships with foreign peoples such as Phoenician and Greeks, are known in central Italy—mostly in Etruria and Latium—and are typical traits of the Etruscan and Latin cultures. In the tenth and ninth centuries, certain elements such as the miniaturization of funerary objects, the ancestor cult, and votive offerings to divinities are actually better

documented in Latium than in Etruria. The idea of miniaturizing weapons is an exclusive characteristic of Latium; bronze statuettes and votive deposits occur in Latium earlier than in Etruria. This tendency is supported by some recent finds that have expanded previous knowledge: miniature bronze items, including chariots and weapons, and bronze statuettes have been found extensively in graves dating to phases I and II of the Latial culture at Santa Palomba (a site near Rome), the Alban Hills, and the Tyrrhenian coast.⁴¹⁰⁰ Even if these elements reveal the early tendency of the region's inhabitants to embrace identity, are they enough to conclude that the Latins defined themselves as "Latin" before the Etruscans defined themselves as "Etruscan"? The question remains open, but these cultural elements are important for us to stress the relevance of the inhabitants of Latium already in the early Iron Age.

There is earlier evidence of writing in Latium than in Etruria, too. In the eighth century, only a few inscriptions are attested in the Italian peninsula, and they all belong to the second half of the century. An interesting graffito was recently discovered on an uniquely shaped olla in the female Grave 482 in the Osteria dell'Osa cemetery, datable to the first quarter of the eighth century at the latest, if the provenance from that tomb is definitive. This new text is generally read as Greek *eulin* (in this sense it could refer to skill in weaving, according to David Ridgway), but there are other readings, too. Giovanni Colonna suggested a retrograde Latin reading *ni lue*.⁴¹⁰¹ If Greek, it would be the oldest evidence for this language in Italy, and would suggest that written Greek was present in the Latin area independent of Etruscan influence. If Latin, it would constitute the oldest evidence of this language and would show how old the Latin language was formed and used.

Another tomb group at the Osteria dell'Osa cemetery indicates the probable presence of Etruscan people in this Latin community. Grave 600, which unfortunately was explored only after its destruction by a plow, was isolated, as was customary for eminent burials, according to evidence in several cemeteries. It contained bronze objects belonging to a high-ranking warrior—not only defensive equipment (a crested helmet, two round shields, and a breastplate) and offensive weapons (a sword with its scabbard, a spearhead, and a javelin), but also vases (an amphora, four ribbed bowls, and a basin) and the remains of a cult wagon. Three further similar wagons are known, all found in Veian tomb groups, dating to the second half of the eighth century.⁴¹⁰² In central Italy in the eighth and seventh centuries, cult wagons were reserved for individuals of high social rank, mostly warriors playing a role in ceremonies. According to the finds, and especially the wagon, tomb group 600 may belong to a warrior of Etruscan origins, probably from Veii, who was buried in the cemetery of Osteria dell'Osa, because very probably he was in the Latin community of Gabii that used that cemetery. If this is true, geographic mobility between Etruria and Latium can be assumed in the second half of the eighth century.⁴¹⁰³

3The Orientalizing period in Latium (730–580)

If complex tomb groups allow us to assume episodes of geographic mobility, isolated Etruscan finds in Latial contexts raise other possibilities, such as trade relationships or gift exchanges between members of the elite. A possible gift is the Etruscan bronze horse tripod with rider, which belongs to a group produced at Vetulonia, found in Grave XLIII in the cemetery of La Rustica, east of Rome, and dating to the first half of the seventh century.⁴¹⁰⁴ Luxury goods of this period are concentrated in tomb groups in the Latin center of Praeneste, whose geographic location allowed it to control not only the natural route between Latium and Campania, but also the road to the Apennine passes in the direction of the Adriatic region. Thanks to its location, Praeneste's elite was presumably able to charge a toll on people passing on the routes and through the territory under their control.

The set of jewelry from the Galeassi tomb—consisting of gold bracelets, silver pendants, silver fibulae, an amber necklace, a silver-plated bronze pectoral, and additional unidentifiable objects—has been assigned to a workshop in Caere, where similar items have been found.⁴¹⁰⁵ More impressive are the sumptuary goods from other tomb groups in Praeneste, such as the Barberini and Bernardini tombs, which date to the second quarter of the seventh century. The Bernardini tomb contained a very large number of luxury items, which have few comparisons anywhere in the Italian peninsula, and cannot be listed in their entirety. The highlights among the precious metal vases are a gold *skyphos* mounted with tiny sphinxes decorated with granulation, three Phoenician silver bowls with friezes, a North Syrian bronze cauldron on its stand, and a silver wine set. A small Phoenician gold-plated silver cauldron was “etruscanized” by applying to it six gilded silver serpents, which partly cover the original decoration. A set of gold jewelry, including a breastplate, is Etruscan, but a glass bowl and ivory carved plaques have North Syrian and Phoenician origins. The Etruscan connections of the high-ranking individuals or kings of Praeneste are declared by the Etruscan inscription on the Phoenician silver bowl belonging to the wine set from the Bernardini Tomb. One can read *vetusia*, meaning “(I am property) of Vetus,” the personal name of the owner, who is probably the deceased buried in the tomb.

If the inscription is Etruscan, we must recognize the presence of a high-ranking individual, probably of Etruscan origin, in the Latin city of Praeneste.⁴¹⁰⁶ The Barberini Tomb contained a small number of similar precious items, but included a sheet bronze throne and a silver pin with gold head, 34.5 cm long, which was probably used as scepter, clarifying the royal status of the deceased. The best comparisons for both Praeneste tomb groups are in southern Etruria, namely in the Regolini Galassi Tomb at Caere, so that the Near Eastern and Etruscan luxuries likely reached Praeneste through Etruria, probably through Caere.

If the case of Praeneste shows a dependence on the Etruscans, due to the

strategic location of the city, in other areas the autonomous initiative of the Latin centers to establish relationships must be emphasized. This is the case of Phoenician transport amphorae, used only for wine, which between 725 and 650 are documented only in Latium vetus and not in Etruria.⁴¹⁰⁷ We can expect further finds to be made in Etruria, because it is widely accepted that the form of Etruscan transport amphorae was inspired by Phoenician forms.

A possible role for the Etruscans in Latium in the first half of the seventh century is revealed in the geographic distribution of painted pottery from Corinth. These vases have been found in coastal localities such as Lavinium and Satricum, together with Etruscan pottery such as *bucchero sottile* and subgeometric vases, at the earliest from the second quarter of the seventh century.⁴¹⁰⁸ Because the Etruscan vases are characteristic of Caere workshops, one can imagine this city's role in developing a wave of trade from southern Etruria to Latium. The coastal locations show that the trade was carried out by sea, with the mouths of rivers (at Lavinium, Ardea, and Satricum) and natural creeks (at Antium) serving as adequate harbors. These centers were connected by land as well.

A central place in Latin cities was Satricum, near modern Borgo Le Ferriere, where a cemetery, a votive deposit, and several huts have been explored, dating from the eighth century onward. The huts have an oval, rounded, or rectangular plan: the first two plans are the earliest. The sets of painted pottery found in many huts, such as VI and XIII, include both imported Proto-Corinthian and locally made vases. The votive deposit is the richest known in all of central Italy (Fig. 79.2). From around 730 to 540, votive offerings were mostly clay vases, but silver jewelry was also given to the god. Like the huts, the votive deposit yielded both imported and locally made vases, including Proto-Corinthian and Corinthian pottery. *Bucchero* pottery follows the patterns of Caere's workshops, confirming Satricum's close relationship with Caere. This is stated by the only inscription found in the votive deposit, scratched in Etruscan on some *bucchero* sherds of a cup dating to the last quarter of the seventh century mentioning "*mi mu[---]e velchainasi*." The text is to be restored using the identical but complete inscription on a *bucchero* cup in private ownership, "*mi mulu larisale velchainasi*," meaning "I (have been) given by Laris Velchaina." The complete inscription has neither context nor provenance, but it can be assigned to Caere, where the family name Velchaina is documented.⁴¹⁰⁹ So, these inscriptions further confirm the close relationship between Caere and Satricum, which persuaded Laris Velchaina—probably a native of Caere who was buried there in a chamber tomb that yielded the intact cup—to give a votive offering in the sanctuary at Satricum in the last quarter of the seventh century.⁴¹¹⁰ A similar but somewhat later case is made by two *bucchero* vases, in the sanctuary of Portonaccio at Veii and in a chamber tomb in the necropolis of Lavinium. On a jug from Veii and an amphora from Lavinium, both dating to about 570, are scratched two similar inscriptions "*mini*

m[ulu]vanice mamar:ce a.punīe,” meaning “me gave Mamarcē Apunīe.” The syllabic punctuation shows that Mamarcē Apunīe was probably a native of Veii and bought the two vases there, offering the first in the home sanctuary and the second to the men buried in the tomb at Lavinium.⁴¹¹¹

4The Archaic and Late Archaic period in Rome (580–450):*La grande Roma dei Tarquinii*

Rome, the most important city in Latium, had a continual relationship with the Etruscans and was under Etruscan hegemony at least from the end of the seventh to the sixth century during the reigns assigned by the historical sources to three kings of Etruscan origin: L. Tarquinius Priscus (616–578), Servius Tullius (578–536), and L. Tarquinius Superbus (535–509). Following an influential article by Giorgio Pasquali on the subject, this flourishing period has been called *La grande Roma dei Tarquinii*.⁴¹¹² Scholars have discussed the real character of the Etruscan period in Rome, and a range of

possibilities, from simple presence to domination, has been explored.⁴¹¹³ Rome has not yielded purely Etruscan contexts, with a very few exceptions. Among them is the disturbed collection of pottery, found on the Caelian Hill under the Palazzo Apostolico Lateranense (modern-day Piazza San Giovanni in La-terano), which originally belonged to the fine tomb groups of the late seventh–early sixth centuries, and were later removed from their original location.⁴¹¹⁴ The presence in Rome of natives of Etruria is attested by the literary sources, which mention the *vicus Tuscus*, the Etruscan quarter, dating to the period of the monarchy, located near the Forum between the Palatine and the Tiber.⁴¹¹⁵ According to the literary tradition, in the period of the Etruscan kings, impressive changes were carried out, such as the draining of the site and the paving of the Forum by Tarquinius Priscus. That same king built the Circus Maximus between the Palatine and Aventine Hills and planned the huge temple of Jupiter on the Capitoline Hill, which became the sacred citadel reserved for cult buildings. The plan of the temple of Jupiter, the largest in the city, was based on the three-room model characteristic of Etruscan tomb, house, and religious architecture. The dimensions, on the other hand, measured during recent excavations as 50 m wide by 68 m long, are unique and are hard to interpret for several technical reasons, as, for one thing, its roof would have been nearly 3,500 m². According to some literary sources, Tarquinius Superbus, who finished the building, charged Etruscan craftsmen with making the terra-cotta acroterial statue (statue atop the pediment), reproducing a quadriga.⁴¹¹⁶

The Regia in the Forum and the temple of Mater Matuta in the Forum Boarium show that the plan adopted in the temple of Jupiter was not unique, but buildings on the three-room model belong to archaic house and religious architecture in Rome. Thanks to its location in the trade area of the Forum Boarium, the temple, built around 580–570 and restored around 540–530, had the character of an *emporium*.⁴¹¹⁷ It is the oldest known temple built according to the three-room plan, in either Etruria or Latium. Some chamber tombs in Caere that date to the end of the seventh century show that the plan is an original Etruscan development.⁴¹¹⁸ The votive offerings include bucchero and Etrusco-Corinthian ware, both imported from Etruria and locally made. It is not easy to determine the origins of the vases. Among the votive offerings, very important is an ivory tablet in the form of a lion, on whose reverse is inscribed *araz silqetenas spurianas*, meaning “(I belong to) *Araz Silqetenas* (of) *Spurianas*.” This little tablet, dated to the second quarter of the sixth century, has been identified as a *tessera hospitalis* belonging to Araz Silqetenas and was intended to match a similar piece belonging to Spurianas. As with a similar find from Carthage, the purpose of the *tessera hospitalis* was to state the (trade) relationship between the two persons (see chapters 10 D’Ercole and 88 Naso). Because the family name Silqetenas is quite similar to the name of the Punic city of Sulcis in Sardinia, it has been argued that Araz Silqetenas was a guest from Punic Sardinia, while Spurianas

could be the Etruscan from Rome. According to many scholars, the Etruscan Araz in Rome instead of Arath in Etruria is characteristic of Rome, and the form might indicate that the inscription was incised by an Etruscan from Rome.⁴¹¹⁹ This is confirmed by the bucchero bowl with the Etruscan inscription *ni Araziia Laraniia* “I (belong to) Araziia Laranai,” which was found under the Capitoline Hill in a well near the temple of Saturn.⁴¹²⁰ It testifies to the presence of Etruscans in Rome in the second half of the sixth century who spoke a particular dialect, and together with the above-mentioned *tessera hospitalis*, shows how old the settlement of Etruscans in Rome was, which the literary tradition knew under the name of the *vicus Tuscus*. According to the literary tradition, at the end of the sixth century, the Etruscan Porsenna, king of Clusium and Volsinii, attempted to control Rome and Latium, but his effort was stymied by a Roman and Latin army in a battle near Aricia around 504.⁴¹²¹

5The Archaic and Late Archaic periods in Latium (580–450)

Etruscan finds from Latium show that the close relationships between the communities of the two regions continued in the second half of the sixth century. The development of a common style, including the same decorations and motifs, is clear in the terra-cotta plaques with figured friezes used to ornament the roofs of buildings that have been found in several findspots in Rome and Latium. Although this decorative system had probably come from Veii to Rome and Latium already by the end of the seventh century, as the most recent finds in the Piazza d’Armi show,⁴¹²² around 530 it developed further with the creation of the decorative system known from such main findspots as Veii-Rome-Velletri. Revetment plaques with figured friezes in relief and antefixes made from the same molds characterize these roofs, which are closely related to roofs belonging to the Caere system, because they probably had common Ionian origins.⁴¹²³ The friezes, meant to decorate the lower parts of the roofs, offer scenes of chariot races, chariot processions, a seated assembly, and a banquet, and were formidable devices for expressing the ideological values of the powerful inhabitants of the buildings concerned, as they often repeat the same scenes dozens of times. Here we may mention the roofs from Velletri and from Caprifico near Cisterna di Latina, which both belong to temples (Fig. 79.3).⁴¹²⁴ In the fifth century, the tradition of the three-room-plan temple continued, as shown by the dedication of the temple of Castor and Pollux, the Dioscuri, in the Roman Forum in 484.⁴¹²⁵

6Other peoples in modern Latium and central Italy

A complete overview of the relationships between Etruscans and the peoples settled in Latium other than Latins is still to be written; at the moment only some individual cases can be mentioned.

Sabines were traditionally one of the more ancient populations of central Italy, if not the oldest of all. They were settled in the mountains of modern-day Abruzzo and Lazio, around L'Aquila and Rieti as far west as the Tiber, which was the geographical and spiritual heart of ancient Italy.⁴¹²⁶ According to ancient sources, a series of migrations from Sabine territory gave rise to Picenes and Samnites, from which Lucanians and Brettians successively emerged. The Sabine settlement pattern was a dispersed one, with its major centers along the left bank of the Tiber, such as Eretum, Magliano Sabina, Poggio Sommavilla, and Cures Sabini.⁴¹²⁷ Relationships with Etruscans are clear not only through specific finds of luxury objects, such as the remains of a bronze wagon from Grave XI of the Colle del Forno cemetery, but also through inscriptions. A little clay flask from Poggio Sommavilla with a Sabine inscription, dating to the end of the seventh century, was probably inspired by Near Eastern prototypes known in Italy by way of Etruria (Fig. 79.4). Its counterpart is a larger flask from Chiusi, dated to the same period, also with a Sabine inscription.⁴¹²⁸ The second of these, probably a gift, shows the existence of deep connections between the Etruscan elite of Chiusi and the Sabine Tiber Valley at the end of the seventh century, the age of Tarquinius Priscus. According to Dionysius of Halicarnassus (3.58–59), the Roman king once defeated an army assembled by several central Italic communities, including both Sabines and Etruscans from Chiusi. Because the Etruscan army arrived in Latium through Sabine land, following the suggestion of some Sabines, the episode may prove the existence of good relations between Sabines and the inhabitants of Chiusi. Later finds show the distribution of luxury Etruscan objects in northeastern Latium, such as bronze mirrors from southern Etruria, which date to the third century.⁴¹²⁹

Fig. 79.3: Velletri pediment reconstruction drawing (after Palombi 2010, p. 114, fig. 1a)

The land located on the right bank of the Tiber between the Cimini Hills, Mount Soratte, the Tiber, and the Via Cassia was called *Ager faliscus*, after the name of its inhabitants, the Faliscans.⁴¹³⁰ They had close relations with the Etruscans, as shown by about twenty Etruscan inscriptions concentrated in cemeteries of Narce, near modern-day Calcata, which date to the seventh and sixth centuries. Some are incised on votive offerings in sanctuaries of the fourth and third centuries. Several older texts follow the writing norms used in the inscriptions from the Portonaccio sanctuary at Veii and probably refer to Etruscans from this city; they allow us to assume the existence of an Etruscan community living in the Faliscan Narce.⁴¹³¹

Etruscans are also documented in southeastern Latium in the land settled by the Hernici, around modern-day Anagni and along the natural course of the Sacco River Valley. A bucchero jug from Grave 22 from the Ominimorti cemetery near the modern-day village of San Biagio Saracinisco has a shape characteristic of bucchero jugs from a Caere workshop dating to the second quarter of the sixth century, which were exported to southern Etruria and Pontecagnano, and outside Italy as far as Marseille.⁴¹³² To the second half of the sixth century belong a few inscriptions found in the sanctuary explored at Santa Cecilia; there are a few Etruscan terra-cotta-decorated temples in other localities in the same region, and they have been connected to workshops at Caere.⁴¹³³

From the Iron Age onward, close relationships connected Etruscans and Umbrians, who lived along the left bank of the Tiber and in the adjacent areas of central Italy.⁴¹³⁴ In the sixth century, the Umbrian elite appreciated Etruscan bronze vases from workshops of Volsinii Veteres, modern-day Orvieto, as shown by the finds from the cemetery of the Umbrian community near modern-day Colfiorito di Foligno, which controlled a strategic crossing.⁴¹³⁵ Sanctuaries played a special role in the relationships among people of different origins and allow us to recognize foreigners, because each generally offered the deities the characteristic votive gifts he offered at home. In this way the dedications of South Umbrian bronze statuettes in Etruscan sanctuaries may reflect South Umbrian believers in Etruria.⁴¹³⁶

In modern-day Abruzzo, archaic Etruscan trade is attested by fine ware and bronzes. The main findspots are grave groups belonging to the local elite in the cemeteries of Campovalano (in the province of Teramo), Fossa, and Bazzano (both in the province of L'Aquila). Campovalano yielded bronze vases, both imported and locally made; Fossa and Bazzano yielded Etrusco-Corinthian pottery dating to the sixth century (Fig. 79.5). Some Etrusco-Corinthian vases from Abruzzo have been assigned to workshops in Vulci, and it has been noted that drinking cups are often in male graves, while jugs are in female ones. Vases from Athens may have also reached Abruzzo via Adriatic *emporia* like Numana.⁴¹³⁷

Fig. 79.4: Clay flask from Poggio Sommavilla with Sabine inscription (from NS 1896)

7Late Classical and Hellenistic periods (450–250)

From the fourth century onward, relationships between Etruria and Rome changed, because as Rome continued to expand, it began to conquer first Latium and then the Etruscan cities (see [chapter 37](#) Marcone). Thus it is easier to identify Roman traces in Etruria than Etruscan traces in Latium, as shown, for instance, by the wall paintings of the François Tomb in Vulci, dated to around 330. Here, Cneve Tarchunies Rumach from Rome is depicted among Etruscan warriors coming from several cities involved in a battle; it has been suggested that these scenes be identified with a fight for the control of Rome, which might have happened two centuries before the grave paintings were made. Evoking his ancestors' glorious past, the tomb's owner stressed his own glory against the same enemies⁴¹³⁸ (see [chapter 57](#) Gilotta). For this period, scholars have focused on close relationships between Etruria and Latium in handicraft production of both bronze and clay vases and utensils, which went in both directions (see [chapter 58](#) Ambrosini). From this period onward, the Etruscan legacy to Roman civilization began to increase steadily (see [chapter 38](#) Torelli).

Gianluca Tagliamonte

80 Southern Italy

Abstract: A part from the Villanovan site of Sala Consilina, there were no permanent Etruscan settlements south of present day Campania after the end of the 8th century BCE. There is however archaeological evidence that there were individuals or groups of individuals of Etruscan origin present in the area south of the river Sele and a network of cultural contacts and commercial exchanges which linked the centres of Tyrrhenian Etruria and etruscanized Campania to local populations (Oenotrians and Iapygians, in particular) and to the Greek colonies of Southern Italy between the seventh and fifth, and in some late cases fourth, cent. BCE.

The evidence for the existence of these individuals and contacts lies in the discovery in Southern Italy of objects related to burials, shrines and settlements which were certainly or likely to have been of Etruscan manufacture (i.e. made in Etruria, Etruscan Campania, Etruscan Po Valley) especially bucchero pottery, bronze vessels and jewellery.

On the basis of this kind of evidence, the paper aims at analysing the cultural and historical meaning of these artefacts, according to the various needs for self-representation of local élites (particularly Oenotrian and Daunian) and to the different routes of trading. With reference to this last aspect, the archaeological evidence allows us to identify a series of long-distance routes over land and sea by which “Etrusco-Tyrrhenian” artefacts entered and were distributed in Southern Italy.

Keywords: Oenotrians, Daunians, Campanians, Iapygians

Introduction

Apart from the Villanovan site of Sala Consilina (which fell into decline towards the end of the eighth century BCE) there were no permanent Etruscan settlements south of present day Campania in later periods. There is, however, archaeological evidence that there were individuals or groups of individuals of Etruscan origin present in the area south of the river Sele. There was also a network of cultural contacts and commercial exchanges that linked the centers of Tyrrhenian Etruria and Etruscan Campania to local populations (Oenotrians and Iapygians, in particular) and to the Greek colonies of Southern Italy between the seventh and fifth (and in some late cases, fourth) century.⁴¹³⁹

The evidence for the existence of these individuals and contacts lies in the presence in Southern Italy of objects—especially bucchero pottery, bronze vessels and jewellery—related to burials, shrines and settlements that were likely to have been of Etruscan manufacture (i.e. made in Etruria, Etruscan Campania, or Etruscan Po valley). These have come to assume the value of true and proper archaeological indicators (It. *fossili-guida*) of the contacts

between the Etruscan world and that of Southern Italy. Uncertainties remain about the actual location of the production centers of these materials, together with the unresolved possibility that the artifacts found in Magna Graecia might have been imported from other Etruscan territories or made by artisans, either of Etruscan origin or trained in Etruscan craft, who could have been immigrants or itinerants in the South. The objects may even have been local imitations. All of these possibilities make it difficult to be specific about the historical meaning of these Etruscan connections, beyond the generic reference to their origin as “Tyrrhenian.” What is clear is the fundamental role played in the Orientalizing and Archaic periods by the Etruscan settlements in Campania (especially those of Capua and Pontecagnano) as production and distribution centers of Tyrrhenian artifacts exported to the south.

While these artifacts are often serial (bucchero vases, bronze basins with embossed or braided rims, bronze “Rhodian” *oinochoai* etc.) there are some pieces which are unique or of a very high quality. The latter are almost always status symbols for members of a local elite, or destined for the sanctuaries of Magna Graecia. The artifacts in question are above all from tombs of local aristocracies (particularly Oenotrian and Daunian). The role that the elite played was not only as consumers of imported goods, but sometimes as redistributors within their own areas or in the areas in their zones of influence.

The acquisition of these goods in the Archaic period brought contact with the more structured Etruscan and colonial Greek societies and their ideological and cultural models. Particularly in funerary contexts, the reference to the “Tyrrhenian” banquet and the Greek symposium models is suggested by recurring examples of Etruscan metalwork used in banquets (especially medium and large bronze vessels, like embossed rim basins, “Rhodian” *oinochoai* etc., mostly from Vulci), and by imported buccheri related to wine consumption (trefoil mouth *oinochoai*, *olpai*, *kantharoi*, and *kylikes*). It seems that high social status was displayed not only by the quantity of goods a tomb contained, but by the number of imported goods it contained, and at the ideological level by the use of collective models of self-representation other than the traditional. Archaic Etruscan artifacts, then, appear to represent an important element of definition.

In the regions of Southern Italy, these artifacts seem to have had various and selective means of distribution, according to the various needs for self-representation of local elite and different trade routes. Some areas of Southern Italy have few or none of these products. For example, in Melfi area and in the mid and upper valleys of Bradano and Basento, the bucchero is almost completely absent. On the other hand, in the Agri and Sinni valleys, these products seem to have been popular. In still other areas, there are suggestions of the existence of “sub-regional” distribution networks. In a large part of present-day Basilicata, the “Rhodian” *oinochoe* is frequently associated with the bronze embossed rim basin. In any case, the circulation and distribution of “Tyrrhenian” artifacts (with particular reference to bronze ware and bucchero

pottery) in Southern Italy in the Archaic age do not seem to have involved the acquisition of entire banqueting sets but rather individual and few pieces used as funerary vessels inspired by the previously mentioned ideological models. There are only some examples from the fifth century from specific areas (the territory of Melfi for example), which can be considered complete “services.”

If the circulation and the presence of these artifacts in the Italic and Greek colonial contexts of Southern Italy are the result of commercial exchanges that unite the Tyrrhenian region (and the Etruscan Po valley) to the south and to Greek world,⁴¹⁴⁰ it can be supposed that their presence is not the result of purely economic relationships, but, rather, are of exchanges of a socio-anthropological nature, like a gift-exchange, or “chieftain’s trade,” which would have connected members of the Etrusco-Campanian elite with those of Oenotrians and Daunians.⁴¹⁴¹

1 Trade, exchange, mobility: the land routes

There is archaeological evidence that allows us to identify the probable routes over land and sea by which “Etrusco-Tyrrhenian” artifacts reached and were distributed around Southern Italy. Those over land originated in Etruscan Campania and followed a series of long-distance routes, which went southwards from Campanian *mesogeia*, crossing the mountainous area of the Apennines (the “Trans-Apennine Way”).⁴¹⁴² These routes took advantage of natural features like river valleys and passes, and at least partly followed roads already traveled by men and goods during the Iron Age. These roads, especially those farthest south, had been used to bring pottery from Daunia to Campania (It. *Geometrico Protodaunio tardo* and *Subgeometrico Daunio* 1, following the classification of Ettore De Juliis).⁴¹⁴³ Eighth and seventh century examples have been recorded in internal areas (Caudium, Bisaccia), on the borders of the Campanian plain (Suessula, Nola, Avella) and along the coast (the Sarno valley, Pontecagnano and Pithecusa). It is during the second half of the seventh and above all during the sixth century that heightened relations between Campania and the Apulo-Lucanian area are recorded (in particular with Melfi and Daunia)⁴¹⁴⁴ and that these routes, archeologically marked by the presence of the types of articles mentioned above, took clearer shape.⁴¹⁴⁵

A first route, which led to the Oenotrian region of southwest Basilicata, followed the valley of the Sele river across the Vallo di Diano to the Sinni and Agri valleys, and continued toward the Greek colonies on the arch of the Ionian coast. Along this route there is ample evidence of the presence and movement of goods of probable Etruscan and Etrusco-Campanian origin.⁴¹⁴⁶ The most important Orientalizing necropolises in Vallo di Diano (at the centers of Atena Lucana, Sala Consilina and Padula) and in the Sinni and Agri

valleys (Chiaramonte, Armento and Alianello) have yielded abundant examples of bronze vessels for banquets or symposium (embossed rim basins, “Rhodian” *oinochoai*, tripod lebes, ribbed *phialai*, *kotylai*, etc.) and a smaller number of examples of bucchero vases. Examples of the latter in black, finely burnished bucchero (trefoil mouth *oinochoai* of Rasmussen 7a type, *kantharoi* of Rasmussen 3e type) possibly of Etruscan manufacture from Southern Campania (Pontecagnano, Fratte) were found in male and female tombs from the beginning and the first half of the sixth century (Chiaramonte and Armento).

Grey bucchero wares with brown metallic engobe coatings and a wide range of shapes, some of which are connected to wine consumption, have been found in Alianello, with a single example found at Chiaramonte. These grey bucchero vases came from the Etrusco-Campanian area or were produced locally from the second quarter of the sixth to the beginning of the fifth century. It has been suggested⁴¹⁴⁷ that the silver necklaces from Chiaramonte tombs 142 and 157 may have come from Etruscan Campania, as may have the itinerant artisans who, it is thought,⁴¹⁴⁸ might have produced some of the amber works found at Armento, Chiaramonte, Roccanova, and Alianello etc., northern Lucania (Braidia di Vaglio, Tricarico, Tolve etc.), the areas around Melfi (Melfi, Banzi, and Ripacandida etc.), in Daunia (Canosa) and Peucezia (Rutigliano, Ruvo, Ceglie del Campo, and Valenzano).

A second route, whose characteristics are better defined from the last decades of the seventh century, after the foundation of the Achaean colony of Metaponto, leads from the Sele valley, into the Potentino, enters eastern Basilicata through the Basento and Bradano valleys, and ends in the area around Metaponto. The ancient sites located along this route have not yielded any examples of bucchero vessels, which have been found only around Metaponto, where they probably arrived by other routes. “Tyrrhenian” metallic vessels with basins with embossed or braided rims have been found at Baragiano, Braidia di Vaglio, Serra di Vaglio, Oppido Lucano, Montescaglioso, and Pisticci, as have some “Rhodian” *oinochoai* at Metaponto, and what may be a fragment of a Campanian-type bronze funerary lebes at Anzi.⁴¹⁴⁹

There is important evidence of the link to Etruscan Campania in the Etruscan inscription engraved on the lip of a tripod lebes found in the luxurious tomb 106 in Braidia.⁴¹⁵⁰ The text, written in the characters of the Etrusco-Campanian alphabet, tells us it is a gift and constitutes a very rare example of an Etruscan epigraph south of the river Sele.

A third “trans-Apennine” northerly route joins Campania with the region of Melfi and continues on to Northern Puglia. Starting from south-central Campania, it crosses the Calore and Sele valleys, climbs up to the upper Ofanto valley, touches the cultural centers of the Cairano-Oliveto Citra culture, and arrives first at Melfi and then at Daunia (and from there Peucezia). While there are practically no examples of Etrusco-Campanian

bucchero along the route (only some vases in “impasto buccheroide” have been found, like the *kantharos* in tomb 58 in the necropolis at Melfi/Cappuccini), there are examples of “Tyrrhenian” metalwork, or at least metalwork inspired by “Tyrrhenian” models. It is thought that some were produced locally.⁴¹⁵¹ Bronze basins with embossed or braided rims and “Rhodian” *oinochoai* from the Late Orientalizing and Archaic periods have been found in the centers of the Cairano-Oliveto Citra culture, in northern Lucania (at Ruvo del Monte, for example) and in the Melfi region (at Melfi, Lavello, and Banzi, where “Rhodian” *oinochoai* were absent).

From the end of the sixth century, especially in the Melfi region, which was culturally linked to nearby Daunia, new forms appeared (various types of round-mouthed *oinochoai*, *Schnabelkannen*, *stamnoi*, lamps etc.) sometimes acquired as entire services (one of the most complete of these comes from female tomb 955 in the necropolis at Lavello/Cimitero, dating from the end of the fifth century). Also dating from the fifth century are finds of large bronze candelabra with figured top which could have been made in Vulci but may also have been produced *in loco* (Melfi/Chiuchiari, tomb F; Ruvo del Monte, tomb 64; Melfi/Pisciolo, tomb 48; Lavello/Cimitero, tomb 955).⁴¹⁵² There were also similar finds in the Agri valley (Roccanova).

After this period there was a sharp decline in the importation of “Tyrrhenian” products. The antefixes with a shell frame which have been found from the late Archaic age in the Melfi area (Melfi, Lavello) as well as in Frentania (San Giacomo degli Schiavoni) and Daunia (Serracapriola, Tiati-San Paolo Civitate, San Severo, Lucera, Arpi, Aecae, Orsara di Puglia)⁴¹⁵³ certainly derive from Campanian (particularly, Capuan) models and molds. The Campanian antefixes (originally a system of coating in clay known as “tetti campani”)⁴¹⁵⁴ were a strictly local decoration and during the fifth century gave rise to later regional production, which continued (but with few examples) to the beginning of the fourth century. Antefixes with a shell frame, however, are just one element of the more general problematic question of the relations, or rather the overlaps and structural parallels between the architecture of Magna Graecia and that of Etruria.⁴¹⁵⁵ Their common use of terracotta frieze plaques in the early phases of monumental buildings (sacred and otherwise) also shows this.

Fig. 80.1: Southern Italy: findspots of items both imported from Etruria and imitating Etruscan models

First land route

1 Atena Lucana, 2 Sala Consilina, 3 Padula, 4 Chiaromonte, 5 Roccanova, 6 Armento, 7 Alianello.

Second land route

8 Baragiano, 9 Anzi, 10 Braida and Serra di Vaglio, 11 Oppido Lucano, 12 Pisticci, 13 Montescaglioso, 14 Metaponto.

Third land route

15 Oliveto Citra, 16 Cairano, 17 Ruvo del Monte, 18 Melfi, 19 Lavello, 20 Banzi.

Fourth land route

21 Guglionesi, 22 Termoli, 23 Larino, 24 San Giacomo degli Schiavoni, 25 Macchia Valfortore, 26 San Giuliano di Puglia, 27 Serracapriola, 28 Carlantino, 29 Tiati (= San Paolo Civitate), 30 San Severo, 31 Lucera, 32 Aecae (= Troia), 33 Orsara di Puglia, 34 Bovino, 35 Arpi, 36 Ascoli Satriano, 37 Ortona, 38 Canosa, 39 Manfredonia/Cupola.

Peucetia

40 Minervino Murge, 41 Ruvo, 42 Bari, 43 Rutigliano, 44 Valenzano, 45 Noicattaro, 46 Gioia del Colle, 47 Egnazia.

Messapia

48 Oria, 49 Brindisi, 50 Valesio, 51 Rudiae, 52 Cavallino, 53 Rocavecchia, 54 Vaste.

Sea route from Etruria to Southern Italy

55 Campora San Giovanni, 56 Scalea, 57 Hipponion (= Vibo Valentia), 58 Metauros (= Gioia Tauro), 59 Reggio Calabria, 60 Locri, 61 Cirò Superiore and Serra Sanguigna, 62 Sibari, 63 Policoro (Siris?), 14 Metaponto, 64 Taranto, 65 Satyrion, 66 Faggiano, 67 Ginosia.

A fourth land route runs from Campania to Daunia through the valleys of the Volturno, Calore, Tammaro and Fortore rivers and on to the Adriatic coast. This route is archeologically marked by the presence of heavy bucchero (“bucchero pesante”) vases probably made in Campania, although some could have been produced locally. There were also bronze “Tyrrhenian” embossed rim basins (found in Frentania and Daunia at Guglionesi, Termoli, Carlantino, Tiati-San Paolo Civitate, Canosa, Manfredonia/Cupola, Ascoli Satriano, Ortona, and even at Minervino Murge), and Campanian type antefixes with a shell frame and a rare type of silver band tiara with molded decoration probably produced in Campania (found in a “princely” female tomb in Cupola dating to the late seventh century).⁴¹⁵⁶ Examples have been found in Frentania (Larino, Termoli, Macchia Valfortore, San Giuliano di Puglia) and Daunia (Carlantino, Tiati-San Paolo Civitate, San Severo, Bovino, Lucera, Arpi, Ortona) in forms connected to the consumption of wine. These are mostly trefoil mouth *oinochoai*, carinated bowls, *kantharoi*, *olpai*, often found together and concentrated in the late sixth century.⁴¹⁵⁷

It is the presence of bucchero vases, together with the supine position of the corpses (which indicates a funeral rite extraneous to that of Daunia) that has led to the supposition that the four graves from the last decades of the sixth century found in the necropolis of San Severo/Guadone may be referred to individuals of foreign origin, possibly coming from Frentania or Campanian Etruria.⁴¹⁵⁸ An earlier seventh century indication of the presence of people coming from Etruria (or Campanian Etruria) is the supine corpse in tomb 104 in the Peucetian necropolis at Rutigliano excavated in 1979. Here fragments of thin bucchero (“bucchero sottile”) were also found.⁴¹⁵⁹ The warrior buried on his back in grave 103 (excavation 1833) at Ruvo with an extraordinary collection of weapons may also have had the same origin.⁴¹⁶⁰

From the Melfi and Daunia regions, Etruscan and “Tyrrhenian” artifacts were sent and distributed even to the southernmost areas of Peucezia and

Messapia, where they were the preserve of the local elite. There are a significant number of bronze artifacts, some of which can probably be assumed to have come from the Adriatic by sea.⁴¹⁶¹ The oldest example found to date from the last quarter of the seventh century is a tripod-lebes from Oria, probably produced at Vetulonia. Other “Tyrrhenian” pieces (or those presumed as such) date to the sixth or beginning of the fifth century. These include “Rhodian” *oinochoai* (Rutigliano, Valesio); embossed rim basins (Rutigliano, Minervino Murge, Noicattaro); basins with flared rims and walls probably produced in Etruria or Latium (Rutigliano, Rudiae); a Castel San Mariano type *podanipter* (Vaste); ribbed pails probably made in Etruscan Po valley which could have arrived in Puglia via Adriatic trading routes (Brindisi, Rudiae); several examples of *Schnabelkannen* (Valenzano); and strainers with undulated handles (Ginosa, Rutigliano).

There are more limited examples from the second half of the fifth and fourth centuries, including a beautiful bronze candelabrum with figured decoration from Ruvo. At Canosa and Egnazia, Negau helmets of the Vetulonia type have been found, which are also known at Cairano. Some examples of third generation Etrusco-Corinthian pottery would seem to have been documented at Ruvo and Gioia del Colle. Among the luxury goods destined for members of the Peucetian elite of the Late Archaic, there are decorated plaques in ivory from a chest likely made at Vulci (Ruvo) and some gold Etruscan or Etruscan-inspired artifacts (Ruvo, Noicattaro, Rutigliano) including a necklace with pendants of acorns, lotus flowers and satyr heads dating to around 490–480, which was found at Ruvo and is held in the Naples National Archaeological Museum. Some Campanian black-figure vases attributable to the Leo-Gallo and the Painter of Milano Groups also come from Ruvo.⁴¹⁶² The origin of the local production of a group of high quality black-figure vases (“apulo-etruschi”)—mostly column craters⁴¹⁶³—from the first half of the fifth century in Peucetia and Messapia (Bari, Rutigliano, Ruvo, Egnazia, Cavallino, Rocavecchia, and Vaste etc.) could be directly linked to this latter type of pottery decoration,⁴¹⁶⁴ or with Etruscan black-figure production (particularly with the Painter of Micali workshop at Vulci),⁴¹⁶⁵ if not with Attic black-figure vases.⁴¹⁶⁶ Some scholars have proposed that the beginnings of the Apulian tradition of funerary decoration should be considered alongside the arrival of artisans coming from Campanian Etruria.⁴¹⁶⁷

2Trade, exchange, mobility: the sea routes

Albeit in a limited way “Tyrrhenian” artifacts reached as far as the Greek colonies of Magna Graecia.⁴¹⁶⁸ The presence of fragments of heavy bucchero (particularly Rasmussen 3e *kantharos*, the most common type exported

outside of Etruria and Italy) has been documented along the arch of the Ionian coast at necropolises, sanctuaries and Greek and indigenous settlements. These include Taranto (Taranto, Satyrion, Faggiano), Metaponto (from where some older fragments of thin bucchero also come), Siris (Policoro), Sibari, the Crotona area (Cirò Superiore, Serra Sanguigna) and Locri Epizefiri.

These were vessels that arrived by sea along a route that hugged the coast, and from the Strait went up the line of the Ionian coast and then headed for Greece. It is therefore likely that these bucheri can be considered goods carried by Greek merchant-sailors on their way back from the Tyrrhenian Sea. The same explanation probably applies to the other goods of Etruscan manufacture found along the Ionian coast, like the ivory plaques decorated with banqueting scenes on a Vulci chest, probably from the Persefone sanctuary at Locri/Mannella. Other “Tyrrhenian” objects could have come from Locri but their local provenance has been questioned.⁴¹⁶⁹

It is no accident that heavy Campanian type bucchero, Etruscan bronzes and Etrusco-Corinthian vases were found at Reggio,⁴¹⁷⁰ which must have had an important role on this maritime route that united the “Tyrrhenian” world with Taranto (and Taranto with Greece). Reggio was one of the places from where Chalcidian vases reached Etruria during the sixth century via the “Chalcidian” route. These black-figure vases were probably made in the city of the Strait and were widely exported to the towns of Tyrrhenian Etruria, where they influenced local painting and ceramic production. What is more, there is some modest indication of the presence of Etruscan goods (buccheri, wine amphorae and metalware mostly dating to the first half of the sixth century) on the Tyrrhenian side of Calabria from Metauros and Hipponion to Scalea and Campora San Giovanni.⁴¹⁷¹ In the area of ancient Temesa, among the objects recovered from the temple outside the town of Imbelli (which was active between the mid sixth and the first three decades of the fifth century), were found a Py 4A type Etruscan amphora and a bronze fragment of a crested Villanovan helmet, a sort of *keimelion*, consecrated in the sanctuary.⁴¹⁷²

Ancient literary sources make explicit references to an Etruscan presence in the lower Tyrrhenian Sea, reporting episodes of piracy⁴¹⁷³ or naval skirmishes between the Etruscans and the Greeks from Cnido and Rhodes who had colonized the Aeolian Islands shortly after the fiftieth Olympiad (580–576).⁴¹⁷⁴ Etruscan mercenaries and adventurers were still arriving at the Strait and in Sicily along the Chalcidian route until the beginning of the third century.⁴¹⁷⁵ Finally we should remember the old tradition that suggests that there were Etruscans among the disciples of Pythagoras and the Tyrrhenian origins of the great philosopher himself.⁴¹⁷⁶

81Northern Italy(Piedmont, Veneto, Trentino–Alto Adige, Friuli–Venezia Giulia)

Abstract: Cultural exchange between Etruria and the regions neighboring it to the north finds expression beginning in the Villanovan period in an increasing number of foreign goods in the area north of the Po. In fact the northeastern part of the Po Valley and the adjacent Caput Adriae are comparatively poor in clearly accountable imports from the early phase of these contacts. Various indirect indications, however, suggest the conjecture that this picture is due primarily to the vagaries of preservation. They include the adoption of technological innovations in the north, for instance in wagon-building, as well as the integration of foreign prestige goods, such as the lozenge-shaped belt plaques of the Villanovan culture, into the material culture of the Venetians and their neighbors. The last-named object in particular emphatically clarifies the intensity of the early contacts. Scholarship fully agrees that the belt plaques decorated with waterfowl and sun symbols incorporate entirely specific spiritual and religious content. The acquisition of foreign manners of dress must consequently also have involved an encounter with the ways of thinking of their area of origin. In any case it follows from this that already in the Villanovan period the cross-cultural contacts went far beyond the sporadic exchange of exotic goods to also include communication on the intellectual and social levels.

In the period of the Etruscan “colonization” of the Po Valley, the Veneto and the southeast Alpine region also remain comparatively poor in finds. This holds specifically for imported items of Etruscan metalwork, whose existence, however, must, on the basis of the acceptance of its repertoire of decoration into *situla* art, be considered certain. A distinct change emerges with the founding of Etruscan settlements (Adria, Mantua, Forcello) in the regions across the Po during the sixth century and the associated intensification of trade, which is reflected *inter alia* in the importation of Greek pottery that now begins. Unlike the bronze vessels, the imported pottery is attested in impressive numbers from the mid sixth century in the Veneto. Both in the formal respect and in reference to the decoration of the vessels, however, it is clear that in no way does this involve the total adoption of Greek and Etruscan ideals as they are manifested in pottery. On the contrary, the selective reception of the Athenian ceramic repertoire in the area north of the Po already makes it clear that the importation of foreign goods was substantially determined by the specific needs and wishes of the recipients. Correspondingly it follows that the imports fulfill a function in the native context that differs considerably from what they had in their places of origin, and this—*mutatis mutandis*—is also to be assumed for the preceding periods.

Keywords: import, cultural exchange, trade, Venetians, prestige goods

Introduction and problematics

The northern frontier of Etruria, which is generally considered identical with the course of the Po, has long been a permeable space. Already in the Bronze Age, traces of distant cultural contacts have been found that extend beyond the Po Valley into the southern Alpine valleys and regions beyond the mountains. We refer specifically to the settlement of Frattesina near Fratte Polesine in the Veneto, which excavated materials reveal to have been closely connected with the regions of the Po Valley and central Italy, but which also functioned as an important junction in a network of transregional contacts between the Italian peninsula and the northern Alpine area.⁴¹⁷⁷ During the ninth and eighth centuries BCE, on the southern edge of the Po Valley a dynamic branch of the Villanovan culture emerged that was closely tied to the core region of the Villanova culture in central Italy and simultaneously radiated impulses to the north. With the Etruscan expansion into the Po Valley from the first half of the sixth century onwards, cultural exchange with the north took on systematic traits that left their traces specifically in the area of the Golasecca culture in a proper “Etruscanization” of the local elites.

Archaeologically, the contact is represented by a growing number of imports in the area north of the Po. For the most part these are valuable items made of bronze and other costly materials, which—on the basis of their material, their distant origin, or their exotic form and decoration—enjoyed a high reputation and circulated in the context of the exchange of prestige goods between high ranking members of the social elite in both the Mediterranean as well as the non-Mediterranean world. We refer primarily to weapons, bridles, clothing ornaments, and bronze banquet vessels, but pottery and glass vessels, primarily of Greek origin, were also exported beyond the northern borders of Etruria. The same must be assumed for items made of organic materials, which for obvious reasons have left only limited traces. The export of wine must have been foremost.⁴¹⁷⁸ Moreover, other valuable exotica, such as incense —on the evidence of a discovery from Como-Rebbio⁴¹⁷⁹— were also traded in the north.⁴¹⁸⁰

Along with the transfer of goods across the cultural boundaries of Etruria there was also an exchange of ideas, technologies, and social ways of life, which is often evidenced only indirectly in the material culture. We may mention for example the quick spread to the periphery of an aristocratic Etruscan warrior ethos based on military success and economic power, which is reflected in the increasing number of weapons and metal vessels deposited in the tombs of the early Iron Age.⁴¹⁸¹ Later, in the sixth and fifth centuries, the genesis of new social ways of life can be verified not least by the increasing number of imports, especially of pottery from Athens, which, more strongly than before, was characterized by egalitarian criteria.⁴¹⁸² The Attic pottery, which in many places determines the picture of the contacts, follows uniform formal and qualitative standards across a wide area. Exchange with the south in this period appears to have been supported by broader circles, a circumstance that—along with others—may have been jointly responsible for

the emergence of the first protourban settlement structures in the southern foothills of the Alps.⁴¹⁸³

1The first contacts (ca. 800–730 BCE)

With the expansion of the Villanovan culture into the Po Valley, during the ninth century a dynamic process of economic and cultural interaction with the neighboring cultural areas set in.⁴¹⁸⁴ On the one hand, this can be read off the foreign goods in the Bologna tombs,⁴¹⁸⁵ and on the other from finds of the Villanovan culture in the area north of the Po. Already in the latter, though, it is often difficult to distinguish “genuine” imports from Bologna or central Italy from products that were created in local workshops in imitation of foreign models, a circumstance that alters little, however, about the facts of cultural contact per se.

From the very beginning, the attention of the protourban center of Villanovan-period Bologna was directed to the southern Alpine valleys that provided access to the mountains, and to the regions beyond. Interaction with the inhabitants of the southern foothills of the Alps appears often to have taken place at intermediate stations. Specifically, close contacts existed with the great Venetian settlement of Este, which through its location near the Adige River controlled one of the most important trade routes into the Alpine region. In the tombs from this area, several objects have been found that scholars partly classify as “genuine” imports, and partly see as imitations. These include, along with an *antenna* sword of the Fermo type⁴¹⁸⁶ (which has an exact counterpart in the bronze hoard from San Francesco in Bologna⁴¹⁸⁷), a lozenge-shaped belt plaque with engraved decoration showing spirals and waterfowl from the rich woman’s burial Este, Pelà Tomb 8.⁴¹⁸⁸ It belongs to a type widespread in Etruria,⁴¹⁸⁹ of which several examples have also been found in Bologna.⁴¹⁹⁰ The Este belt plaque is probably not an Etruscan “original,” though, but a local imitation, as Raffaele de Marinis has recognized.⁴¹⁹¹ However, the Etruscan provenience of a belt plaque from Pfatten/Vadena in the Adige Valley is undisputed. Further examples of the same type, most of which must have been made locally, are known from the necropolis of Baldaria in Cologna Veneta near Este,⁴¹⁹² from Leifers/Laives⁴¹⁹³ in the Adige Valley, from Cles⁴¹⁹⁴ and Mechel⁴¹⁹⁵ in the Nons Valley, and from Fliess in the upper Inn Valley⁴¹⁹⁶ and Wörgl in the lower.⁴¹⁹⁷ In their geographic orientation toward the Adige Valley and the neighboring valleys of the northern side of the Alps, the findspots clarify the course and target area of the long-distance contacts of Villanovan-period Bologna and their orientation along a staged traffic network (Fig. 81.1).

Fig. 81.1: Distribution map of the bronze lozenge-shaped belts in Italy, without Tivoli and San Giovanni in Galilea (compiled by A. Naso)

Alongside the belt plaques, which are female clothing accessories, the significant role played by high-ranking women in cultural exchange is also expressed in two bronze spindles from Este, which once again find their best parallels in examples from Bologna.⁴¹⁹⁸ Being an integral component of female dress, belt plaques take on special significance—they must have most likely “wandered” northward with the wearers.⁴¹⁹⁹ In any case, the finds testify to the penetration of foreign styles of dress into the Venetian and central Alpine cultural sphere during the eighth century.

Similar contacts are manifested in two bronze tripods with curved legs decorated with eyelets from Este and Novo Mesto.⁴²⁰⁰ They have typological counterparts in Bologna⁴²⁰¹ and Vetulonia,⁴²⁰² which, as Giovannangelo Camporeale has convincingly set out, was in all likelihood the city where they were produced.⁴²⁰³ Two more examples of the same type are known from Verucchio on the Adriatic coast.⁴²⁰⁴ These vessels should probably be recognized as the expression of a direct long-distance contact between the Etruscan center on the Tyrrhenian coast and the native power centers in the southeastern Alpine area, a long-distance contact that also emerges in the distribution of other bronze items. These include horse bits of the Veii type, which once again are attested in Bologna, as well as in the Adige Valley with

the find from Pfatten-Stadlhof (Fig. 81.2).⁴²⁰⁵ The latter are probably local imitations, which, however, just like the well-known horse shaped bronze bit from Zurich-Alpenquai and another example from the former *Komitat* of Zolyom north of Budapest, point to the widespread distribution of the early Etruscan harness. To be taken into consideration here is not only the export of the horse's bridle alone, but also of horses as especially prestigious status symbols of Iron Age elites. In Etruria, where the bits are often consigned to the tombs in pairs, horses appear to have served as draft animals pulling chariots and wagons. It must be more than mere coincidence that at the same time in the Alpine area and in the regions beyond, *Winkeltüllen* (construction elements of the wagon) appear in large numbers, which point to the adoption of Etruscan wagon technology.⁴²⁰⁶ Direct evidence of an Etruscan wagon in the Alpine area, however, has not yet emerged.

The appearance of Etruscan-influenced horse and wagon equipment in elite funerary practice on the periphery of the early Etruscan world likewise manifests the adaptation of the native elites to the status- and representation forms of their southern neighbors. In the wider sense this also includes the use of corresponding weapons and armor, of which the spread of the *antenna* swords of the Tarquinia type and its local variants is an example.⁴²⁰⁷ In the eastern Po Valley and the Caput Adriae, *antenna* swords are known from Ponte Nuovo di Gazzo Veronese, Este, Preara, Casier, Ba-gnarola, and Tret in the Val di Non. Although again in many cases originals imported from the south cannot be distinguished with certainty from local imitations, the weapon burials and weapon dedications nonetheless reveal the genesis of a warrior ethos that can be compared over a wide culture area.⁴²⁰⁸

2The Orientalizing period (ca. 730–580 BCE)

In the Orientalizing period, the export of Mediterranean goods to the north continued. As in the Villanovan period, the number of verifiable imports to the eastern part of the Po Valley and the southeastern Alpine headlands remains comparatively limited. Alongside the aforementioned tripods from Este and Novo Mesto a ribbed bronze bowl from Este (Fig. 81.3) must be mentioned⁴²⁰⁹ which belongs to a type attested in northern Italy by two more examples from the Tomba del Carrettino of Ca' Morta near Como.⁴²¹⁰ These three bronze vessels are of especial significance, because they belong to a class of object widespread in the north, which with great probability was made in Vetulonia.⁴²¹¹ The available chronological information support a dating of the vessels to the end of the eighth and the first half of the seventh centuries. The distribution pattern of the ribbed bowls, whose northernmost findspot is near Frankfurt-Stadtwald (Fig. 83.1),⁴²¹² suggests that behind their export hides a deliberate strategy of the early Etruscan rulers of Vetulonia. It

is a short step to accept that the tripods from Este and Novo Mesto are also to be seen in a similar context, though remarkably, these are not yet attested north of the Alps, while the ribbed dishes are not found in the southeast Alpine region.

Fig. 81.2: Horse-shaped bronze bit from Pfatten/Vadena (photo F. Marzatico)

Among the most significant traces of Vetulonian bronze exports in the Orientalizing period belongs with great probability the well-known bronze basin from Ca-stelletto Ticino, decorated with a frieze of fabulous animals (Fig. 81.4), whose closest stylistic parallel is the bronze disk decorated with sphinxes and lions from the “Circle of the Sphinxes” from Vetulonia.⁴²¹³ The richly ornamented bronze basin from Castelletto Ticino, which dates to the first half of the seventh century, takes on a special position among the early Etruscan imports in the area north of the Po. The assumption that it was transferred northward in the framework of an individual exchange of prestige goods between rulers of the two sides of the cultural boundary of the Po is tempting and so has long been seen. Camporeale has recently postulated an origin in a Vetulonian workshop for the well-known bronze *pyxis* from Appenwihr (Fig. 83.3).⁴²¹⁴ Various indications suggest that after its manufacture, the piece was reworked and altered.⁴²¹⁵ The ribbed bowl found together with the *pyxis* was also modified afterward, in this case by the addition of two bronze rings. The two vessels from Appenwihr make it clear that the Mediterranean prestige goods led an independent “life” in the “Barbaricum” and possibly were used within local networks of gift exchange.

Fig. 81.3: Bronze ribbed bowl from Este (after Sciacca 2005)

The findspot thus need not *a priori* be identical with the original destination of the vessels. Nevertheless, on the whole there emerges a coherent distribution area of Vetulonian vessel exports, which on the one hand is oriented via the Swiss Alpine passes into the Rhine Valley and on the other via the Veneto into the southeast Alpine region (Fig. 83.2).

Moreover, there appear to have been contacts between the two export axes: thus it is possibly more than a mere coincidence that the two bronze vessels from Appenwihr mentioned above were associated with a bronze sieve that is thought to have been produced in Este or the extended area of the Caput Adriae.⁴²¹⁶

It is tempting to assume that the strong engagement of Vetulonia in establishing contact with the north is connected with the city's leading role as center of Etruscan mining efforts in the Colline Metallifere. It is obvious that not only the Greeks and Phoenicians were interested in Etruscan metal and metal technology, but also the neighbors to the north. What moved Vetulonia's rulers to maintain or even to use costly gifts to promote contact with the northern neighbors? What gifts did they receive in return for the ore and the technological know-how that they sent north? Scholarship plausibly argues that it was done with goods that cannot be documented archaeologically, such as perishable items and human resources in the form of slaves and mercenaries. Material transfer from north to south can be grasped more concretely in the example of some selected bronze vessels, among them the *Kreuzattaschenkessel*, which occasionally reached as far as the core Etruscan area and are probably to be regarded as return gifts in the framework of a reciprocal gift exchange between the elites of the two sides of the Po (Fig. 82.4).⁴²¹⁷ These vessels, which are distributed north and south of the Alps, are concentrated in two centers near the Caput Adriae, which is probably where they were made—the eastern Veneto on one side and Slovenia and Istria on the other—thus, the same two zones that on the evidence of the aforementioned tripod and ribbed bowls stood at the focus of Etruscan trading interests. Given this background of cultural connections, it cannot be by chance that among the *Kreuzbandkessel* exported to the south an example has also been found at Vetulonia (Fig. 82.4).⁴²¹⁸ But what made the rulers at the Caput Adriae attractive trading partners for the Etruscans? It seems likely that

raw materials played a major role. We may consider metals from the Alpine region, but also amber, which already in the Orientalizing period appears south of the Alps in increasing quantity, including in Vetulonia.⁴²¹⁹ A large part of this fossilized material that came from the Baltic region⁴²²⁰ must have been brought through the eastern Alpine passes to the *Caput Adriae* and from there was traded either overland or by sea to northern Italy. In the framework of this trans-Adriatic “amber trade” the settlement of Verucchio acquired a leading role, and from there the raw material was taken farther into the central areas of Italy, including Bologna, where amber goods experienced a real boom in the late eighth and the seventh centuries.⁴²²¹ The appearance of Etruscan tripods of the Vetulonian type in the amber town of Verucchio, discussed above, fits into this background, confirming the model of a trans-European transportation and trade network in the Orientalizing period driven by Etruria, in which Vetulonia played a leading part.

That Etruscan products themselves reached the Baltic and the Atlantic only in exceptional cases does not necessarily contradict the supposition of purposeful trading relations with the distant lands *a priori*. Thus the Celtic potentate of Frankfurt-Stadtwald may well have come into possession of a Vetulonian ribbed bowl, because his sphere of control lay on an important long-distance route that led farther north.⁴²²² He would thus have come to the attention of the Etruscans for the same reason as his peers, who controlled the trade routes across the Alps farther south.

Fig. 81.4: Bronze basin from Castelletto Ticino (after *Italia omnium terrarum alumna*, Milan 1988)

Distant trans-European relationships of the Early Iron Age find concrete manifestation in a biconical bronze amphora from Gevelinghausen on the lower Rhine, whose best comparisons come from Villanovan-period Veii (Figs. 44.1 and 44.2).⁴²²³ Of a somewhat younger date is the cauldron that gave its name to the Hassle type in Sweden. It has good parallels in Caere and

Monteleone near Perugia.⁴²²⁴ While in some cases it must be left open how the imports reached their findspots, they show that the radius of Mediterranean goods—and therefore probably of the people who stood behind the transfer of these goods—reached far beyond the area of the middle Rhine.

Unlike Lombardy and the nearby southern Swiss Alpine valleys, where trans-Alpine communication is manifest in the continuous deposit of finds into the fifth century, the Venetian and southeast Alpine regions are distinguished in the same period by a notable absence of imports. Two basins with embossed rim from Vače and Magdalenska gora,⁴²²⁵ two “Bolognese ribbed cists,” the handle of a *Schnabelkanne* from Este,⁴²²⁶ and the handle attachment of a bronze situla from Padova⁴²²⁷ belong to the scant material evidence of exchange of goods with the south, which incidentally might have taken place not only over land routes, but also by sea.⁴²²⁸ Various considerations, however, suggest that this picture depends on the archaeological record and therefore does not correspond to ancient reality. Here we must refer first to the retrospective pictorial tradition of situla art that was native to this area, brought to notice by Otto-Hermann Frey. The oldest demonstrable representatives of this style can be dated to the years around 600, including the famous situla from Tomb 73 at Este, Benvenuti.⁴²²⁹ Stylistic features in the formulation of the figured friezes and vegetal ornaments, however, point back to the Orientalizing period of the seventh century.⁴²³⁰

It is natural to suppose that the iconographic models of sixth and fifth century situla art are to be sought in imports from the Etruscan area which have not been preserved, an assumption that appears to be confirmed not least by the existence of clay imitations of *Schnabelkannen* in the area,⁴²³¹ not to mention the well-known belt plaque from Este, Carceri (Fig. 81.5), on which a symposium scene according to the Graeco-Etruscan tradition is portrayed, once again making use of a *Schnabelkanne*.⁴²³²

Strong influences from Etruria are also manifested in the famous cult wagon from Strettweg, whose rich figural decoration is hardly imaginable without models from the south (Fig. 82.6).⁴²³³ Unlike the bronze vessels with engraved and embossed decoration, which are adapted from Etruscan pottery and metal originals, the statuettes on the wagon from Strettweg stand under the influence of Etruscan figurines. Are we to accept that as well as tableware, sculptural works were exported into the contact zone north of Etruria as well? This question is of special consequence because the figural Etruscan bronzes occur in a different context from the imported vessels. While the latter reveal a connection with the symposium and the banquet, the bronze figurines are mostly connected with cultic requirements, as is very clearly expressed in the wagon from Strettweg. Independent of the question as to whether the wagon was built directly on the model of an Etruscan cult wagon or whether it represents an independent creation that derives only indirectly from southern models, on the whole it follows from it that the native bronzesmiths closely

oriented their work to the Etruscan figurative small-sized sculptures.⁴²³⁴

The two examples demonstrate that the Etruscan export of goods to the northeast must have been considerably more intensive than can yet be recognized from the picture transmitted by the archaeological record.

Fig. 81.5: Bronze belt plaque from Este, Carceri (after Frey 1969)

3The period of the foundation of Etruscan cities in the Po Valley (sixth–fifth centuries BCE)

With the founding of the Etruscan harbor towns of Adria and Spina in the second and third quarters of the sixth century, trade relations with the north changed.⁴²³⁵ Besides goods that traveled farther north by land routes across the Apennines, wares increasingly appear that were distributed from the Adriatic coast along the course of the Po and other rivers. To the latter belongs in all probability a large portion of the Greek pottery that appear in increasing numbers from the middle of the sixth century onward in the Veneto and eastern Lombardy.⁴²³⁶ Among the oldest pottery imports, an amphoriskos of the Fikellura style from Forcello that dates to the third quarter of the sixth century deserves to be mentioned.⁴²³⁷ The vessel belongs to a style rarely found in Etruria. All the stronger, therefore, weighs the proof of a second Fikellura *amphoriskos* in Adria, which underlines the role of the Etruscan harbor town in the development of the interior beyond the Po.⁴²³⁸

At about the same time, in the second half of the sixth century, Attic pottery begins to appear increasingly in settlements in the Veneto, although the paths of origin cannot be determined with certainty. Land transport via Bologna is just as likely as the sea route. More important than the question of provenience is the fact that export from the Etruscan centers was no longer limited to their own goods, but Attic ceramics and products originating outside Etruria were sent north as well. The Etruscans thus functioned in this case as brokers for foreign products.

Athenian vessels thus experienced a double cultural transformation, which is reflected for example in the formal composition of the finds in the indigenous contexts north of the Po. Drinking cups are by far the most common, while mixing and pouring vessels, which in Greece and Etruria are

major components of symposium paraphernalia, are only occasionally found.

It is striking that the repertoire of images on the Attic ceramics exported to the north also clearly differs from that on finds from Etruria, and even more strongly from those found in Greece. Mythological and religious themes find virtually no echo on the imported vessels. Instead, what prevails are noncommittal “everyday” pictures, scenes from the palaestra, and disconnected Dionysiac themes. Also noteworthy is the preference for vessels without figural decoration. Black-glazed vessels and vessels with purely geometric or floral ornament are found in disproportionate number among the imported pottery from the area north of the Po. As an example we may mention the spread of the favored floral-band cups, which are also well attested in Etruria.⁴²³⁹ But with respect to the northern Italic region, there is a clear discrepancy in distribution. While they are only occasionally found in the area south of the Po, they appear in the regions north of the river in strikingly larger numbers. At least one example has been found in the central Alpine region, in Sanzeno.⁴²⁴⁰

The floral-band cups are also found in remarkable numbers in Adria and Forcello.⁴²⁴¹ Thus, the distribution of the vessels consequently appears to reflect a specific mechanism of distribution and reception, which was decisively controlled by the Etruscan centers in Adria and Forcello and tailored to the needs of the local customers.

4Conclusions

Cultural exchange between the Etruscans and their neighbors to the north found expression from Villanovan times onward in an increasing number of imports. Of course precisely the northeastern part of the Po Valley and the adjacent Caput Adriae are comparatively poor in clearly accountable foreign finds, which is likely due primarily to accidents of preservation. Across the entire time span dealt with here, from the eighth to the fifth century, a widespread reception of the Etruscan stock of forms and the imagery preserved on them can be observed in the material legacy of the native cultures of the Veneto and the eastern Alpine area. Prerequisites for that are intensive personal contacts between the various interest groups taking part in the exchange, which must also have been accompanied by the adoption of intellectual ideas and social practices from the south. Despite this close interaction with the Etruscan world, the cultural appearance of the Venetians and their northern and northeastern neighbors is distinguished overall by a noteworthy independence, which is expressed not least in their free and independent dealings with imported goods.

VI. Etruscans outside Etruria

Etruscan Finds in Europe

Gerhard Tomedi

82South and southeast Central Europe

Abstract: The archaeological record provides insights into the encounters of these neighboring cultural groups and allows to note the striking similarities in late Bronze Age material culture between the Apennine peninsula and the zone north of the Alps.

During the ninth and eighth centuries BCE, goods from the Alpine and southeastern Alpine area first appeared in rich male burials. At first glance, settlement patterns like pre-urban centers in both regions appear similar, but in fact, they are not. After the advancement to a sophisticated civilization, the Etruscans must have been seen as somewhat like a desirable paradigm to the local cultural groups.

Keywords: Veneti; southeastern Hallstatt culture; protourban centers; gift exchange

Introduction

The judging of the relationship between Etruria, the Veneti and the southeastern Hallstatt culture was notoriously controversial for a long time. The extreme and often unilateral mentalities of earlier researchers are sufficiently known. The school of diffusionism, propagated mostly in older research, was simply taken for granted, as it was assumed that creative centers of the South had supplied the little-developed North with excellent goods.⁴²⁴² But some effective studies—notably those by Gero von Merhart—showed in some cases a technical primacy of Central Europe.⁴²⁴³ So the “Italic fascination” came into doubt for the first time.

A precise chronology is crucial for the comparative assessment of the dynamics of the production of valuable goods, as well as of the social behavior and their deducible implications. In the meantime we have reliable dates and no longer depend on poor chronological estimations, based on alleged stylistic developments of middle and late geometric Greek ceramics imported into Central Italy. However these finds have broken ground for some newer important detailed studies that show complex large-scale interactions of supra-regional groups north and south of the Apennine ridge. Looking back to the late Bronze Age we must keep in mind the striking similarities in the material culture between the Apennine peninsula and the zone north of the Alps (see [chapter 44](#) Iaia).⁴²⁴⁴ Thus, some neo-diffusionist essays will be neglected here.⁴²⁴⁵

1Settlement patterns in Etruria

Without a doubt, the most serious change in the social life of early Etruscan communities proceeded in the tenth century BCE when almost every small late Bronze Age village and hamlet was abandoned, and vast protourban centers were founded.⁴²⁴⁶ Actually, we can observe the change in social systems, from a large group of segmented societies in Elmer Service's sense⁴²⁴⁷ to large communities on their way to becoming early city states (see [chapter 33](#) Pacciarelli).

Despite few excavations, the course of events of this occurrence is reliably explained by clearly distinguishable tomb groups surrounding the new centers, which have been interpreted as the cemeteries of the main lineages (Lat. *gentes*) involved in this process.⁴²⁴⁸ Besides thoughtful planning and adequate logistics, the creation and construction of such vast settlements required a very large number of laborers.

Apart from the increased potential of community services, this population growth also increased the supply of resources and goods, access to mineral resources, and “a constant flow of information.”⁴²⁴⁹ This obviously must have been the deciding point, according to the theory of the school of memetics in the sense of Richard Dawkins.⁴²⁵⁰

At any rate, beginning in the eighth century in Central Italy we observe an increase in the production of fine goods that shows quick changes in modes and styles, from which we can determine a chronology. Only a few generations after the foundation of these protourban centers, a process of social differentiation began, which created powerful military leaders from upper-class families, and monarchs (*reges*) who were able to affront the desirousnesses of the Phoenicians and Greeks of land, mineral resources and other goods (see [chapter 47](#) Naso).

But before the discussion of the interactions between the elites of Etruria and those from the south and south-east Alpine regions it seems appropriate to recall in mind at first the settlement patterns in the regions considered here.

The foundation of vast settlements on Etruscan hilltops during the ninth century was of course not a unique phenomenon in prehistoric Europe. Apart from Early or Middle Bronze Age complexes, many fortified hill forts were founded in Central Europe in the twelfth century, but none survived until the Hallstatt period (eighth to fifth centuries). They are evidence only of an ephemeral type of dwellings.

2Protourban centers in the South-Alpine area

In the ninth century, on the fruitful plains south of the Alps between the Adige and Piave Rivers, the Este culture (It. *cultura atestina*) grew from the roots of

a flourishing Bronze Age culture (Fig. 82.1). Since in many cases the Iron Age settlement areas are covered by contemporary cities, excavations could only be conducted in small sections. It was crucial to determine if the early settlements had covered the whole area or if the later protourban centers had grown around small late Bronze Age villages.

At Oppeano, the gentle plateau near the Adige River was covered by a huge city-like settlement of approximately eighty hectares, even in the Early Iron Age. Alessandro Guidi and Massimo Saracino have emphasized, “that the old theory of the ‘phase difference’ in the urbanization process between Central and Northern Italy is evermore unsustainable.”⁴²⁵¹

At Padua near the Brenta River, the waterlogged soil in many areas brought the main problem to the settlers.⁴²⁵² It became necessary to build drainage channels to keep the water away. Steeper zones were covered with clay to archive flat surfaces. Many of these large and collective constructive works date to the eighth century.

The graves of the ninth and eighth centuries consisted mostly of small *fosse* in which were disposed an urn containing some personal attire and a bowl as a lid. Due to excellent excavation techniques it was also possible to recognize shallow barrows, circumscribed by wooden *crepis* covering the cremation graves. The reopening of tombs for the insertion of secondary burials was quite common.⁴²⁵³

Anyway the ties among the families must have been still strict due to distinctive grave districts. The famous “Tomba del Re”⁴²⁵⁴ and the “Tomba dei Vasi Borchianti”⁴²⁵⁵ were discovered to the east of the settlement, and the grave rich in finds 318⁴²⁵⁶ was to the south of the settlement.

The topographic situation at Este is similar. The prominent necropolises of Casa di Ricovero and Via Santo Stefano are situated northeast of the medieval Castel Morlungo,⁴²⁵⁷ and the Fondo Rana zone is far to the east of the old core of the huge protourban center of Este.⁴²⁵⁸ From the late seventh century onwards, the center was surrounded by five sanctuaries dedicated to different sophisticated cults, showing many variations in the rituals that took place there in honor of a multitude of deities.⁴²⁵⁹ But what would become the future city grew from an aggregation of small settlements dating from the eleventh to the ninth centuries.⁴²⁶⁰ The pre-urban settlement shows no traces of strong fortifications. On the contrary, it was situated on the plain at the southern foot of Monte Caleone. Defense was obviously not an important factor to the inhabitants, whose steadily increasing social stratification is also evident. Only on the periphery, on the southern slopes of the Alps, many natural or artificially fortified smaller settlements could be detected, that probably secured the main routes to the mineral resources of the Alps. Since some were abandoned in the ninth and eighth centuries, Giovanni Leonardi argues that people would have left in favor of the steadily growing new centers,⁴²⁶¹ an occurrence also considered in light of the decline of the vast Bronze Age settlement of Montagnana Borgo San Zeno.⁴²⁶²

Fig. 82.1: Major cultural groups in the south and south-east Alpine Area and sites mentioned in the text

The topographic situation and the settlement patterns differ from Etruria considerably. Anyway, the mode of the foundation and the social background indicate somewhat like a “Venetic model”. Of course, both the Etruscans and Veneti succeeded in establishing long-lasting population centers. Both must have had developed internal structures comparable to the “arts of navigation” in Plato’s sense ruling a state (Pl., *Plt.* 299 c) to succeed in organizing the crowded early city states.

3 Protourban centers in the Southeast Alpine area

The landscape of Lower Carniola (Dolenjsko, Slovenia) is somewhat similar to Etruria. The area between the Sava and Krka Rivers is subdivided by numerous streams into areas that feature tall hills and fertile basins.

Researchers recognized some fortified hilltop settlements quite early on,⁴²⁶³ but a systematical exploration only began much later.⁴²⁶⁴ A first milestone was the excavations at Stična.⁴²⁶⁵ A huge hill fort connected to the tumuli led Stane Gabrovec to suggest a “Stična-type” of habitat (Fig. 82.2).⁴²⁶⁶

The so-called Cvinger at Stična encompasses an area of twenty hectares. Of

great importance is the fact that the whole rampart was erected within a very short time frame, which has to be the result of a logistical mastery.

The hill fort is surrounded by many differently sized grave mounds. Apart from some humble burials, the larger tumuli also contained richly provided graves, which Gabrovec calls relics of *primi inter pares*.⁴²⁶⁷ Since several mounds have been contemporaneous erected, they have been bound to a social structure based on families or clans. Graves of socially disadvantaged groups were located in flat cemeteries, which are much more difficult to trace, so that the total number of estimated inhabitants seems to fit to the available area of the settlement. Phil Mason demonstrates that the social landscape included some newly discovered lowland settlements.⁴²⁶⁸

Between 1981 and 2005, the Slovenian Academy of Arts and Science explored eighty-five hilltop settlements as part of a special research project, which was published by Janez Dular and Sneža Tecco Hvala.⁴²⁶⁹ Numerous testing trenches have been dug and they revealed some surprises. Seven minor hill forts were erected as early as the twelfth or eleventh centuries, a further thirty-three in the tenth or ninth century, seven of which were continuously settled into the Hallstatt period. Thus, the settlement patterns of the late Urnfield period are contemporaneous with the founding of the large Etruscan protourban centers. The largest hill forts, of ten to twenty hectares were built during the time of transition from the late Urnfield to the Hallstatt periods (thus app. above 800 BCE), a period of rapid expansion that led to a flourishing culture.

Fig. 82.3: Synopsis of the extremely rich grave fittings in the grave at Kleinklein in Styria (after Egg, Kramer 2005)

In order to achieve a hierarchy of settlements, Dular and Tecco Hvala evaluated the dimensions of the settlements and of the accompanying cemeteries, and the level of wealth in the burials. This led to a comprehensive grouping of leading and minor hill forts. Although it is not expressly written by the two scholars, one might think on well-defined territories of leading protourban centers and their hinterland with dependent settlements similar to Greek city states.⁴²⁷⁰

The societies of the southeastern Alpine Early Iron Age must have faced quite different circumstances, including raids by eastern horse people around 600, and the “Celtic” invasion in the third century.⁴²⁷¹

Another cultural group covering middle and eastern Carinthia and southern Styria shows a different picture. Most of the grave mounds contain a central grave and not always only a few secondary burials.⁴²⁷² Other than Poštela, near Maribor, hill forts have been poorly explored. Due to the lack of sufficient data at the moment it seems impossible to point to clear settlement patterns.⁴²⁷³ The area on the Burgstallkogel (Styria, Austria) in the valley of the river Sulm, is extremely small (approximately one hectare).⁴²⁷⁴ This could be explained by the very special social structure. The rich graves of three or even four generations of extremely powerful warriors could be interpreted as burials of kings in the sense of a *regulus* as the Romans would have denominated such persons (Fig. 82.3).⁴²⁷⁵

4Structural similarities and differences

It is evident that neither the foundation of hilltop settlements nor of protourban centers was exclusively Etruscan. We know little about their fortifications, which have been often heavily disturbed by later buildings.⁴²⁷⁶ Most of the largest hill forts in Dolenjsko were erected in the eighth century, approximately a century later than in Etruria.⁴²⁷⁷ Completely different from both was the land-use in the Veneto, with large undefended major and minor centers in the plain connected by a system of small sites in the hilly hinterland.

A cursory view of the graveyards shows some analogies between the settlements in Etruria, Veneto and Dolenjsko. Namely, the burials are grouped by family, which has led to the idea of an oligarchic structure.⁴²⁷⁸

At least partially Etruscan communities abandoned from the beginning of the protourban phase the structure of family-based societies. At Veii the burials in the Quattro Fontanili cemetery are not grouped by family, but are grouped in chronological order of the deceased, and without a strict spatial separation of poor or high ranked persons.⁴²⁷⁹ One might think of this cemetery as a common graveyard of an early city-state's community.

Also the forms of the burials differs in considerable way. Urn graves in flat cemeteries sometimes in *dolia* are the typical form in the elder phases in Etruria, inhumations appears in the course of the eighth century, grave mounds at the end of this century⁴²⁸⁰. Cremation was the predominant burial rite of the Veneti, the urns deposited in stone cists that were often reopened for further burials of the same family.⁴²⁸¹ In all cases these graves became enclosed by stone slabs or a wooden *crepis* apparently covered by small mounds.

Erecting tumuli was a changing custom. In Dolenjsko tumuli appear at the beginning of the eighth century, containing first only a few urn graves and later in the course of the same century, an increasing number of inhumations. In the late seventh century, there could be up to 164 burials. Therefore the architecture of the graves in these three regions shows autonomous developments.

Claus Dobiati has compared grave chambers of dry walls with a *dromos* in the royal tumulus called Kröllkogel in the valley of the Sulm (Styria, Austria) and further examples in Süttő, Vaskeresztes (Transdanubia, Hungary), Pivola (Štajersko, Slovenia) and Martijanec (Varaždin County, Croatia) with structurally similar grave mounds in Etruria.⁴²⁸²

5Material culture

5.1Swords from 'the north' in ninth century Etruria

Solid hilted swords belong to the tradition of central European bronze smiths (see [chapter 44](#) Iaia). *Antenne* swords find their antecessors in the north-Alpine three-ridged types. Instead, a completely different tradition shows the flange-hilted swords with pommel in use from the late Bronze Age in Central Italy and in Calabria (see [chapter 11](#) Egg), rightly called *spade italiche* by Vera Bianco Peroni.⁴²⁸³

The *antenne* sword in grave M 3 at Tarquinia-Arcatelle appears as a heavy news in the local weaponry ([Fig. 41.2](#)).⁴²⁸⁴ Of course one should not rely on the often-repeated depreciatory estimation of the Etruscans as notorious copyists.⁴²⁸⁵ Much more adequate is the predication of Louis Daniel Nebelsick, who emphasized the ‘ostentatious presentation’ of foreign contacts by leaders of the social elites.⁴²⁸⁶ This fits with the idea of the eminent chieftain of a family that soon will take over the leading role in the social fabric of Tarquinia much better.⁴²⁸⁷

The manner and methods of contacts with Central European chieftains remains unclear. At the moment when in Etruria sophisticated burial manners appeared, in Central Europe a new canon of burial rites had banned to put distinctive goods in the graves. *Antenne* swords comparable to the item from Tarquinia were mainly found in lakes in modern day Switzerland.⁴²⁸⁸ A geographical connection between Etruria and modern day Switzerland has given by the sword found in a grave in Ponte Nuovo at Gazzo Veronese in the Po valley, dating to the second half of the ninth century, the same period of the burial at Tarquinia.⁴²⁸⁹

Swords should not only be seen as weapons. The small number of finds from Etruscan necropolises in comparison to warrior graves in other places equipped with axes or spears reveals the leading position of their bearers. Etruscan chieftain burials, therefore, deliver an excellent paradigm for the funerals with swords in the south and southeast Alpine region, which were often sparsely equipped.

During the eighth century, the design of Etruscan *antenne* swords were changed slightly,⁴²⁹⁰ whereas in the south and southeast Alpine regions they were completely reshaped;⁴²⁹¹ they were called by Markus Egg “traditional swords.”⁴²⁹² Bologna, the Etruscan *Felsina*, was certainly a point of interception, because besides prestige goods from the south and north, almost all variations have appeared here (see [chapter 44](#) Iaia). These *insignia* connect the leading Etruscan warriors with the ‘*koiné adriatica*’ in the sense of Renato Peroni.⁴²⁹³

5.2 Warriors in movement

No data exist about one or two Italic swords of the Vulci-type, which are reputed to have come from Stična and are now in the British Museum.⁴²⁹⁴ Since Biba Teržan had noted the tendency to shorter blades of arms for the

close combat as an influence of Etruscan warfare, these Italic swords might have been a key role in south-east European weaponry, if the provenance is correct.⁴²⁹⁵

A Villanovan type helmet was discovered in Hallstatt, the eponymous site in the heart of the Alps. Unfortunately, the records of grave 49 (so called Linz excavations) are too contradictory for a reliable interpretation.⁴²⁹⁶

Another fragment of a Villanovan helmet was found in a vertical cave—the Mušja jama—in the Karst region of Slovenia (Notranjsko) as one of many offerings once deposited there.⁴²⁹⁷ It might have been booty sacrificed to an underworld god.

The bowl-shaped helmet from tomb 85 at Verucchio-La Rocca causes interpretative problems. There is no doubt that the piece's provenance is the Dolenjsko group,⁴²⁹⁸ but it was found together with typical regional rich male attire, a pair of horse bits as a *pars pro toto* fitting for a chariot, a plentitude of local ceramic vessels, and even wooden furniture very similar to that of the *Tomba del Trono* (see [chapter 76](#) von Eles), but strangely enough without real weapons.⁴²⁹⁹ In terms of who was buried in tomb 85, tentatively one could think about a political hostage, an *obses*, which is what the Romans would have called such a person somewhat later.⁴³⁰⁰

Pairs of spearheads in southeastern Hallstatt culture have often been erroneously seen as a reflex to the armament of Greek *hoplites*. But the combat technique of the *phalanx* was strictly combined with the double handled shields (see [chapter 11](#) Egg). Marco Pacciarelli points out that pairs of spearheads first appeared on the Apennine peninsula in Early Iron Age (second half of the tenth century) Calabria long before the Greek influence in southern Italy.⁴³⁰¹ In Etruria multiple spearheads turn up as grave furniture in the second half of the eighth century.⁴³⁰² In Slovenia, on the contrary, pairs of spears regularly appear from the second half of the seventh century onwards.⁴³⁰³ Since in both regions the same form of oval shield with central handle (*scutum*) was in use,⁴³⁰⁴ and axes were the most common weapon for close combat, there are certain analogies in warfare to discern. So it is no wonder that Italic helmets with brims became adopted by elite southeastern warriors. First there appeared types from Picenum, and later in the sixth century appeared the Etruscan varieties of helmets of the Negau-type.⁴³⁰⁵

5.3 Gift exchange in Etruscan courts

The bronze cup found in grave M 3 in the necropolis at Tarquinia-Arcatelle derives from Central European craftsmanship, like the *antenne* sword. Cristiano Iaia focuses on a small tripod bearing little vessels on its rim—a local product whose archetypes as ceramic models can be traced to the eleventh century⁴³⁰⁶ and confirms the existence of regional variations on the elaborated banquet. The pompous crested bronze helmet, the spearhead with

faceted tube as well as the serpentine fibula covered with gold foil demonstrate furthermore the high ranking status of the buried warrior as well his social affiliation.

Although Etruscan workshops had revealed a first heyday during the eighth century, eastern Alpine bronze vessels appeared in outstanding graves.⁴³⁰⁷ Giovannangelo Camporeale was probably exaggerating when he tried to ascribe a bronze basin with horizontal handles bearing bull-head protomes and lotus-attachments in cypro-levantine tradition to a “maestro hallstattiano” comparing the decorative band in the line of staff with a meander in form of swastikas.⁴³⁰⁸ Since the decorative band never appeared in the east-alpine region but on ceramic vessels in Bologna,⁴³⁰⁹ the personification of a ‘proto-’ Helico, the famous Helvetic smith in Rome who was recorded by Pliny (Plin. HN 12.2.5), does not seem very reliable.

The two bronze buckets from the circoli “delle Sfingi” and “delle Pellicce” in Vetulonia doubtless originate from eastern Alpine workshops (Fig. 82.4).⁴³¹⁰ Alberto Dei interpreted some cases of a completely harnessed horse—in the form of harnesses in Pontic-Danubian style found in Etruscan graves—as the presents of hostesses.⁴³¹¹

Personal contacts between the elite of both regions can be pointed out. Georg Kossack reflected on expeditions leaded by military attachments.⁴³¹² Reciprocity on home base might be the fitting model of trade after Colin Renfrew.⁴³¹³

But the buckets were just part of a multitude of exotic goods of attraction.⁴³¹⁴ One must not forget the bronzes from Sardinia, or later on, ceramic vessels from Greece—mainly drinking cups (see chapter 44 Iaia). Regrettably, classical archaeologists tend to overestimate the role of Greek finds from abroad. Thus, Greek imported pottery is often seen as an influence in drinking costumes of the local elites. Instead of *krateres*, *lebetes* and *stamnoi*, the Etruscans preferred biconical amphorae as mixing vessels complete with ladle-cups with rounded bottoms and cups made entirely of bronze to sophisticated drinking sets.⁴³¹⁵ These components also differed considerably from those used by high-ranking persons in the Venetic and in the eastern Alpine area, which can be traced even to the twelfth century.⁴³¹⁶ Situlae with ladles, dippers, strainer-cups and drinking cups formed the sets used by the elites for the banquet.

Fig. 82.4: The distribution of bronze buckets of the type Merhart B2b

5.4 Out of Etruria

Particular eighth- and seventh-century graves in southern Etruria were furnished with equipment for upscale banquets. Thin iron spits with rolled-up ends are distinctively Etruscan. Additionally, firedogs, bronze plates, tripods and respectively so-called horse-tripods complete the ceremonial furnishings. A few graves in the western Hallstatt culture contained such spits or their local imitations (see [chapter 83](#) Baitinger). A *kreagra* (meat-fork) from the warrior's grave of Gornja Radgona (Štajerska, Slovenia) is an Etruscan

import,⁴³¹⁷ as are the tripods from Este and Novo mesto (Dolenjsko, Slovenia).⁴³¹⁸ As a whole, however, Etruscan imports into the Venetic and southeastern Hallstatt cultures were scarce.⁴³¹⁹

Fig. 82.5: A bronze situla of the Kurd-type with horse attachments from Tumulus 48 in Frög, Carinthia (after Tomedi 2002)

On the other hand, the figurative design of the Etruscan horse-tripods influenced the bronze bowl supported by two human legs from Črnomica at the Rifnik (Štajerska, Slovenia).⁴³²⁰ The same is true for the bronze situla from

Frög/Breg (Carinthia, Austria) bearing horse figurines on the handles (Fig. 82.5); they find their best parallels in Etruscan art.⁴³²¹

Fig. 82.6: The ritual bronze chariot from Strettweg, Styria (after Egg 1996a)

Both graves, in addition to the extremely rich burial from Strettweg (upper Styria, Austria; Fig. 82.6), with its famous ritual model chariot, belong to the seventh century. Markus Egg emphasizes that the chariot's complex design can hardly be suggested without Etruscan paragons, even though exact parallels cannot be traced.⁴³²²

The style and tenor of the Situla Art were inspired by Etruscan orientaling art, even though skilled local artisans created some scenic subjects independently.⁴³²³ Giovanni Colonna believes that an Etruscan sheet bronze

specialist designed one of the oldest situlae, the famous specimen from Este-Benvenuti.⁴³²⁴ Certainly, impacts on ideals count in a cultural historic sight much more than foreign goods. In fact, the number of Etruscan commodities in the south and southeast Alpine area is almost negligible, and imported goods of attraction are quite scarce.⁴³²⁵

A strong obligation to the picture of an Etruscan king arises vividly from the bronze fans found in Histria⁴³²⁶ and in the depiction of noblemen with fans at the situla in Providence (Rhode Island).⁴³²⁷ In the daily life of the elite Etruscan style appealed more and more to new fashions of dress, proven by the change in the design of fibulae from the seventh century onward.⁴³²⁸ Therefore it is no wonder that Etruscans founded an *emporion* at Forcello di Bagnolo San Vito,⁴³²⁹ north of the Po River, at the Mincio River (see [chapter 78](#) de Marinis).

The great number of amphorae found there led Raffaele de Marinis to the plausible opinion that wine was decanted here into wineskins for further transport across the Alps. Of course, this is an uncertain field regarding the trade with goods that are scarcely traceable in the archaeological record, like salt, furs, woven fabrics and all kinds of edible goods. Commodities must have played an important role in trade, as mentioned by ancient historians regarding later contexts (e.g. Hdt. 7.147.2; Strabo 4. 6.8; 17.1.33). Therefore the trade with Baltic or South Scandinavian amber might only give a glimpse of the trade's complexity.⁴³³⁰

There are also difficulties showing the transfer of *nomoi* in the sense of customs and conventions. Etruscan ladies held a high social status within their societies, which is shown by the genealogic system that also incorporated the woman's lineage.⁴³³¹ The women of the Kalenderberg-Culture in the eastern foothills of the Alps also had a high social status.⁴³³² It might not be a mere coincidence that with the beginning of a new dress code during the first half of the seventh century in the southeastern Alpine area—which included Italic fibulae—ostentatiously rich furnished female burials became increasingly common.⁴³³³ Writing became widespread due to the Etruscan interactions with the Veneti and even the Raetic people in the Alpine region.⁴³³⁴

In conclusion, we can emphasize that the cultures in the south and southeast Alpine areas had formed autonomous societies on a high technologic level adapted the regional conditions and climatic factors. There was no need to be on the drip of Mediterranean civilizations to improve to a better mastering of the daily life. But an Etruscan fascination within some local elites seems definitely obvious.

Abstract: Central Italic–Etruscan imports reached the area north of the Alps occasionally beginning in the ninth/eighth century BCE (Ha B 3/Ha C), and increasingly in the Late Hallstatt and Early La Tène periods (Ha D/Lt A). These foreign items played an important role for the native elites who made their name through possession of such prestige objects and created a network of relationships and dependencies through their exchange.

A large number of Etruscan imports into Central Europe are eating and drinking utensils, and so are connected with the ceremonial symposium of the elites. The spectrum of imported utensils was limited, to be sure, and did not embrace the entire bandwidth of what would be needed for a symposium in the Etruscan-Greek sphere. Containers for liquids and drinking vessels predominate such as beaked flagons (Ger. *Schnabelkannen*), which toward the end of the Late Hallstatt and Early La Tène periods (fifth century) become a “type fossil” of Etruscan imports north of the Alps. The increasing inrush of Mediterranean goods was accompanied by an increasing influence on the native Celtic craft industry, which is manifested in the emergence of the Celtic La Tène style, the development of large stone sculpture, and the imitation of Etruscan bronze vessels. How deep these influences reached is shown by the appearance of the potter’s wheel, the adoption of Etruscan fashions, the influx of dried fruits from the Mediterranean area, and the use of a precision balance in the settlement of Hochdorf in Baden-Württemberg. Other aspects, though, are harder to assess, because information on such things as the cut and decoration of clothing is missing from the archaeological record.

From the beginning, Trans-Alpine communication routes seem to have had special significance for the influx of Etruscan imports. On one side they passed through the Golasecca culture in the Western Padan Plain, on the other across the eastern Alps and through Bohemia and Moravia as far as Silesia. Beginning in the second half of the sixth century, the rise of the Greek colony of Massalia/Marseille gained significance for the opening of the route via the Rhône, Saône, and Doubs and brought imported Mediterranean goods to eastern France and southwestern Germany. Contacts reached their apex in the Late Hallstatt and Early La Tène periods, when Etruscan and Greek imports belonged among the indispensable components of the princely graves of the native elites. With the cessation of the custom of princely graves in the fourth century, the number of Etruscan objects in Central Europe falls off sharply.

Keywords: Etruscan imports, Central Europe, Hallstatt and La Tène periods, princely graves, princely sites

Introduction

Etruscan and Greek objects that have been found north of the Alps, far from their places of origin, already piqued the interest of archaeological research in the second half of the nineteenth century. That is the first time bronze utensils

in a Mediterranean style known as *altitalisch* were found in Central Europe. The Italic–Central European connections thus uncovered were significant not only because before the development of scientific dating methods (such as dendrochronology) the Mediterranean goods constituted the sole reliable benchmarks for the absolute chronology of the Late Bronze and Iron Age in Central Europe,⁴³³⁵ but also because they testify to contacts between the Iron Age elites of Central Europe and the advanced civilizations of the Mediterranean area, indeed centuries before the invasion of Celtic groups into northern and central Italy in the fourth century BCE.

The number of Greek and Etruscan finds north of the Alps has grown considerably since then, and the discussion of their points of origin, dating, and significance within the native cultural structure remains in flux,⁴³³⁶ so that in this chapter consideration is necessarily limited to the most important groups of objects.⁴³³⁷ The Alpine area is not included, where northern Italic fibulae from the end of the Urnfield period are well known from Swiss lake dwellings;⁴³³⁸ the many Etruscan objects from western France are also brushed entirely aside, because the circumstances of their discovery often appear quite doubtful.⁴³³⁹

The interaction between the Mediterranean and the Early Iron Age culture groups north of the Alps focused above all on splendidly equipped tombs under large tumuli, the “princely graves” or *Prunkgräber* of the Late Hallstatt/Early La Tène period.⁴³⁴⁰ First place belongs to these prominent burials in which Mediterranean imports and other prominent items of artistic craft production are accumulated, whereas settlements and storage or offering finds retreat as types of sources. The exotic valuables in the princely graves served for the self-presentation of an aristocratic class that legitimated itself through the possession of these “*keimelia*” and that at the same time sought to create an effective network of relationships among themselves through their exchange.⁴³⁴¹ How far the contacts in the Mediterranean area contributed to the development of these groups of persons, or whether their rise constituted the conditions for closer relationships of Mediterranean cultures with those north of the Alps, remains a disputed question, and neither of the alternatives can be definitively chosen.

This chapter covers the time from the end of the Urnfield period—the ninth century (Ha B 3)—to the Early La Tène period, approximately between 450 and 280BCE (LtA/B); the focus lies on the Late Hallstatt and Early La Tène periods (Ha D/Lt A), the sixth and fifth centuries. The briefer consideration here of the earliest, still scattered imports is justified by the existence of modern summaries.⁴³⁴² In any case, purposeful, northward-directed Etruscan trade activities can hardly be considered before the urbanization processes that took place in Central Italy from the second half of the eighth century, and the rise of the Etruscan cities must be understood as important prerequisites for intensified northern contacts from the seventh century.

The oldest Etruscan imports north of the Alps precede those from Greece

(or Western Greece) temporally, since the latter only reached Central Europe in the second half of the sixth century in considerable number, when the Phocaean colony of Massalia/Marseille had risen to be the dominant economic power in the western Mediterranean.⁴³⁴³ Its position near the mouth of the Rhône opened one of the most important trade routes to Central Europe, via the Rhône, Saône, and Doubs on the upper Rhine or via the Seine to the Atlantic coast and on to the tin mines of Cornwall. Above all in the second half of the sixth and early fifth centuries, Mediterranean goods would have reached central France along this route, alongside Attic vases and valuables like the monumental krater of Vix⁴³⁴⁴ and perhaps the bronze cauldron from Hochdorf.⁴³⁴⁵

The question of whether an object was manufactured in Etruria or is an imitation created elsewhere cannot always be clearly answered. The ability to create high-quality metalwork was also possessed by craftsmen in the Po region, the southeast Alpine area, and the Carpathian basin. Without detailed investigations—including manufacturing techniques and metallurgical analyses—uncertainties remain in determining their origin. An argument based solely on formal stylistic observations and distribution maps cannot resolve the doubt.

A considerable portion of the Etruscan finds north of the Alps consists of bronze eating and drinking utensils, which were used in ceremonial banquets of the native elites. They imitated the symposia of the Mediterranean world, but did not exactly copy them. The temporal focus of the imports lies in the Late Hallstatt and Early La Tène periods; their distribution agrees with that of the princely graves. While the earlier princely graves of the northwest Alpine Late Hallstatt region (Ha D) are found primarily in southwestern Germany, eastern France, and Switzerland, those of the Early La Tène period are in a more northerly zone between the Champagne to the west and Bohemia to the east, but especially between the Saar and the Middle Rhine. This fact must be kept in mind in the inspection and interpretation of distribution maps of Etruscan objects in Central Europe. Additionally, it must be kept in mind that only a part of the imports has found its way into the stream of transmission and that the “transfer of ideas” is difficult to identify from archaeological sources.

1The oldest central Italic imports north of the Alps: Late Urnfield and Early Hallstatt periods (Ha B 3/Ha C = ca. ninth century – 625 BCE)

Relations between ancient Italy and Central Europe go back to the Late Urnfield period, but before the end of the seventh century—the beginning of the Ha D phase—remained isolated.⁴³⁴⁶ It appears questionable whether the

oldest Etruscan objects in the north actually arrived there directly, or via a chain of exchanges. Common roots of the Late Bronze / Early Iron Age metalwork of Italy and Central Europe, which are to be sought in southeastern Europe, also play an important role in this context. Religious symbols like the so-called *Vogel-Sonnen-Barke* occur both in the Villanova culture and in the Urnfield period of Central and Eastern Europe, and there are also correspondences in the realm of technical skills (e.g. the point-boss decoration on bronze vessels).⁴³⁴⁷

One of the oldest Central Italic–Etruscan imports in the area north of the Alps is the bronze amphora from Olsberg-Gevelinghausen (Hochsauerlandkreis, North Rhine–Westphalia), which belongs to the Gevelinghausen-Vejo-Seddin group defined by Albrecht Jockenhövel (Figs. 44.1 and 44.2).⁴³⁴⁸ The biconical vessel was preserved in a cremation burial of the Late Urnfield period and finds its best parallel in Grave AA 1 of the Villanovan necropolis of Veii–Quattro Fontanili, which is why it was seen as an import from central Italy,⁴³⁴⁹ as was another amphora that came to light in 1896 in Przesławice (Ger. Prenzlawitz) near Grudziądz (Graudenz, Silesia) in a deposit of the Montelius V period.⁴³⁵⁰ The amphora from Przesławice is one of the northernmost pieces of evidence for a contact zone that extended from Italy to the eastern Alps and Bohemia/Moravia as far as Silesia and also must be considered along with other finds (e.g. fibulae). All in all, the Etruscan provenience of the amphora from Gevelinghausen must remain uncertain, as already indicated by Jockenhövel in the original publication and more recently by Cristiano Iaia.⁴³⁵¹ Jockenhövel connected it with a northern Alpine metal workshop, while Iaia concluded that it had come from the area of the Este culture or the Caput Adriae. This makes it clear how tricky the question of origin is to answer, especially if only a limited number of comparable vessels are available. Furthermore, scattered Villanova razors⁴³⁵² and fibulae⁴³⁵³ are known from Late Urnfield contexts north of the Alps.

Fig. 83.1 a–c: Bronze vessels from burial mound 1 Grave 12 of the Eichlehen group in the Frankfurt City Forest: a. situla; b. ribbed-bowl; c. basins (after U. Fischer 1979, pls. 8–10)

In the Early Hallstatt period (Ha C), Central Europe yields a series of remarkable Etruscan finds.⁴³⁵⁴ A rich grave in the Frankfurt City Forest (Frankfurt am Main, Hesse) included, among other things, a bronze situla with crescent-shaped handle attachments, a bronze ribbed bowl, and two simple bronze basins (Fig. 83.1).⁴³⁵⁵ The Frankfurt grave not only is the richest from the Early Hallstatt period in the Rhein-Main area, but with its four bronze vessels, two of which (at least) are from Etruria, it counts among the richest burials of this period from Central Europe. If we consider the routes by which the Etruscan vessels crossed the Alps, we should bear in mind that parts of the Frankfurt inventory point to eastern Central Europe, such as the yoke that has counterparts in the central Bohemian Bylany culture and the iron cheek-piece of Kossack's Type Ic.

The situla with crescent-shaped handle attachments is the only large vessel in the grave and replaced as beverage container the otherwise normal conical-necked clay vessels.⁴³⁵⁶ Similar bronze buckets are known from graves of the Orientalizing period in central and northern Italy, while north of the Alps only one example from Elsdorf-Oberembt (Erftkreis, North Rhine–Westphalia) can

be set alongside the Frankfurt situla.⁴³⁵⁷

Inside the bucket was a bronze bowl with radial ribs that must have been used as a ladle.⁴³⁵⁸ The excavator's opinion that the bowl (*phiale*) was subsequently changed into a sieve is rather improbable.⁴³⁵⁹ North of the Alps, only five ribbed bowls have been found so far (Fig. 83.2), scattered between Burgundy in the west and Hungary in the east (Frankfurt City Forest, Appenwihr,⁴³⁶⁰ Poiseul-la-Ville,⁴³⁶¹ Hallstatt,⁴³⁶² Sarkad/Hungary⁴³⁶³). Good parallels are found in both older and younger circle graves (It. *circoli*) in Vetulonia, which is also suspected of being the origin of the bowls.⁴³⁶⁴ The burials from the Frankfurt City Forest and Poiseul-la-Ville (département Côte-d'Or) date to the early phase of the Early Hallstatt period (Ha C 1, the second half of the eighth or first quarter of the seventh century). Ribbed bowls and situlae with crescent-shaped handle attachments are found not only in Etruria, but also in the Po Plain, so that an import from northern Italy may be suggested.⁴³⁶⁵

Among the undecorated bronze basins,⁴³⁶⁶ at least the larger one must be of Italic provenience.⁴³⁶⁷ The basins were found together with two clay bowls in the northwest corner of the burial chamber, not far from the animal bones and an iron butcher knife; this indicates that they were components of the banqueting service. Basins with flat rims like the larger of the two Frankfurt examples appear south of the Alps in considerably smaller numbers than basins with embossed rims (Ger. *Perlrandbecken*), a type that appears in southern Germany, for example in Pürgen (Kr. Landsberg am Lech, Bavaria).⁴³⁶⁸ Dirk Krausse chose this vessel as the eponym for his Pürgen variant of the Osovo-Pürgen type, which dates to the end of the sixth and beginning of the fifth century, thus already in the Late Hallstatt period.⁴³⁶⁹ An atypical bowl with a double row of bosses from burial mound IX of Chavéria (département Jura) went together with a Late Urnfield-period sword of the Auvernier type, but was probably buried only at the beginning of Ha C.⁴³⁷⁰ According to Krausse, it is not an import, but a native imitation of an Italic model.⁴³⁷¹

Fig. 83.2: Distribution of ribbed bowls (after A.-M. Adam 1997, 8, pl. 1)

Fig. 83.3: *Pyxis* from burial mound I in the “Kastenwald” of Appenwihr (département Haut-Rhin) (after A.-M. Adam 1997, 14, fig. 3)

One of the aforementioned ribbed bowls from burial mound I in the “Kastenwald” of Appenwihr (département Haut-Rhin) went together with a

pyxis of Etruscan origin (Fig. 83.3). This grave also contained other bronze vessels such as a footed bowl, a ladle, and a sieve.⁴³⁷² In the case of the *pyxis* as well, it is not entirely uncontroversial whether it is an Etruscan original or an imitation. It dates to the mid seventh century, with the decoration on the lid comparable with works from the Este culture, the form comparable with a “censer” from Vetulonia. Friedrich-Wilhelm von Hase saw it as an import from Tyrrhenian Central Italy.⁴³⁷³ Recently Anne-Marie Adam has advocated a dating to the first half or middle of the seventh century.⁴³⁷⁴

Iron spits and fire dogs on which meat was roasted over an open fire are connected with the preparation and consumption of meals. Such equipment is known from occasional Early Hallstatt-period graves north of the Alps (Beilngries [Lkr. Eichstätt, Bavaria] “Im Ried-West” Grave 74,⁴³⁷⁵ Großebstadt [Lkr. Rhön-Grabfeld, Bavaria] Necropolis II Grave 14/1981).⁴³⁷⁶ This is unimaginable without influence from the Etruscan–central Italic area, even if it is merely a matter of local imitations.⁴³⁷⁷ The lancet-shaped grip of the Beilngries spits (Fig. 83.4) corresponds to Kohler’s type IV and is paralleled in rich seventh-century tombs in the Etruscan world (Quinto Fiorentino, Cerveteri, Pontecagnano).⁴³⁷⁸ The number of spits north of the Alps remains limited in Late Hallstatt and Early La Tène–period contexts, but they are now also found in fortified hilltop settlements like that of the Heuneburg on the upper Danube (Kr. Sigmaringen, Baden-Württemberg)⁴³⁷⁹ and the Alter Gleisberg in Graitschen bei Bürgel (Saale-Holzland-Kreis, Thuringia).⁴³⁸⁰ They attest to the acceptance of Mediterranean dining practices. Roasting meat over an open fire was an important component of the sacrificial meal in Greek sanctuaries,⁴³⁸¹ so that the spits and firedogs are doubtless religiously charged objects.

Villanovan fibulae frequently appear north of the Alps in Early Hallstatt contexts, but this includes quite a few early finds, the circumstances of whose discovery remain doubtful.⁴³⁸² Nonetheless it is striking that the future core area of the northwest Alpine Late Hallstatt region in southern Germany and eastern France remains almost entirely devoid of finds. According to Peter Ettel, the “topographic siting on important trade routes appears to be typical of most of the Italic fibulae of the eighth and seventh centuries north of the Alps”.⁴³⁸³ Modern excavations have yielded, for example, an Italic dragon fibula, which was found in 1982 in Necropolis II of Großebstadt (Landkreis Rhön-Grabfeld, Bavaria).⁴³⁸⁴ This fibula probably reached the Grabfeldgau via the eastern Alps and Bohemia/Moravia; its chamber tombs resemble those of the central Bohemian Bylany culture.

Fig. 83.4: Roasting spits and firedogs from Beilngries "Im Ried-West" Grave 74 (after Torbrügge 1965, pl. 28)

Fig. 83.5: Reconstruction of a three-legged table in the Sammlung Nassauischer Altertümer in Wiesbaden (after zu Erbach-Schönberg 1994, 43, fig. 3)

Some exotic Etruscan imports north of the Alps are three bronze table legs with an iron and clay core (now in the Wiesbaden museum). They are very similar to wooden tables from Verucchio (province of Rimini) (Fig. 83.5).⁴³⁸⁵ Supposedly they were found in the spring of 1851 near Saarbrücken, perhaps in a burial mound. That there are three supports this information, as they probably come from a complete piece of furniture whose top is now unfortunately missing. In this case as well, the circumstances of their discovery appear very doubtful. Indeed, Mediterranean furniture is known from Late Hallstatt graves of Central Europe, such as wooden *klinai* with ivory and amber trim⁴³⁸⁶ and the bronze sofa from Eberdingen-Hochdorf (Kr. Ludwigsburg, Baden-Württemberg), which ultimately goes back to Etruscan models.⁴³⁸⁷ It thus appears quite likely that the table legs do indeed come from a rich grave in the Saarland.

2Late Hallstatt period (Ha D = ca. 625–450 BCE)

The second half of the seventh and first half of the sixth century saw in the western and central Mediterranean a perceptible expansion of Etruscan overseas trade, which for example can be understood through the distribution of bucchero (Fig. 49.2).⁴³⁸⁸ The area north of the Alps did not remain untouched by these circumstances, and a strengthened influx of Etruscan objects can now be verified there. While in the Late Urnfield and Early Hallstatt periods there were still mainly isolated vessels, which were hardly ever part of an ensemble, this changed in Ha D, especially with the Ha D 2 phase in the mid sixth century. This is also attributed to the fact that with the princely graves, the type of source comes on the scene for which we can thank most of the Etruscan finds from Central Europe. Commonly, these rich burials lie in close proximity to one of those fortified hilltop settlements that by analogy to the “princely graves” are called “princely sites” (Ger. *Fürstensitze*).⁴³⁸⁹ Finally the idea of constructing fortified central places can be attributed to Etruscan influence, and the establishment of the custom of princely graves in Central Europe can hardly be explained without knowledge of rich burials of the Orientalizing period in central Italy.

As in the Early Hallstatt period, bronze vessels still come to the fore, whereas central Italic pottery (bucchero, Etrusco-Corinthian ware) north of the Alps is extremely rare and, quantitatively, rank behind Attic ware.⁴³⁹⁰ A fragment of a bucchero pesante vessel decorated with a relief representing a winged wildcat—apparently the decorative panel of an incense burner from the second half of the sixth century typical of Chiusi—is said to have come from Alter Gleisberg, a fortified hilltop settlement not far from Jena in Thuringia.⁴³⁹¹ A complete bucchero *kantharos* of Rasmussen’s Type 3e, which is widespread in the western Mediterranean area, was found near Koscielec (Kuyavy, Poland), but unfortunately it was lost in World War II.⁴³⁹² In southern France bucchero is distributed around the Gulf of Lion between Ampurias/Emporion and Marseille/Massalia, but like other Etruscan imports (e.g. transport amphorae) this pottery is not found inland.

Unlike bucchero, Attic black- and red-figure pottery is found everywhere, from the Ha D 2 phase on in Central European burials, but more commonly in settlements. The Attic sherds from the princely site on the Heuneburg belong to the decades between 540 and 480, especially the end of the sixth century.⁴³⁹³ It is hardly accidental that nothing appears here but components of drinking equipment (kraters, jugs, bowls, and beakers), whereas vessels for oils or ointments such as *aryballoi*, *alabastra*, or *exaleiptra* are absent. Thus the ceramic items too—like those of bronze—were used in banquets as festival equipment, and once in a while they were repaired when they broke (Kleinaspergle, Baden-Württemberg).⁴³⁹⁴

During the Late Hallstatt period, not only did the number of Mediterranean objects north of the Alps increase, but cultural influences were now clearly

evident. Thus from the beginning of Ha D, clothing north of the Alps was fastened Italic-style with a fibula, while the dress pin which stands in a Bronze Age tradition quickly lost its significance; the fibula was accepted during the sixth century as far as the region of the Central German highlands.⁴³⁹⁵ While the earliest fibulae were still imported, they soon began to be replaced by native pieces and forms. To what extent the new fashion with fibulae also brought about alterations in the cut and decoration of clothing is hard to determine because of the perishability of the material. The princely grave at Hochdorf yielded a red cloth-like textile, whose dye must have come from the scale insect *Kermes vermilio* native to the Mediterranean, and also the motifs of the textiles proven here show southern influence.⁴³⁹⁶ If the fibulae during the Late Hallstatt period become more and more delicate, this indicates the wearing of more delicate textiles and clothing. The golden sheets attached to the shoes from Hochdorf attest to the adoption of the Etruscan fashion of wearing pointed shoes.⁴³⁹⁷ The custom of decking out burial chambers with drapes, as at Hochdorf, was possibly also influenced by the furnishing of Etruscan chamber tombs.

Around 600, a new fortification wall was erected on the Heuneburg on the upper Danube, which was built using the Mediterranean technique from mud bricks on a base of Jura limestone.⁴³⁹⁸ Such construction seems unimaginable without the presence of a southern architect. The mud brick wall of the Heuneburg was in no way so unsuited to the Central European climate as is stated from time to time, since it existed longer than its successors, which were constructed in the traditional way as wood-stone-earth-walls. A protective plaster and the stone base, which prevented moisture from rising into the core, not only guaranteed it a long lifespan, but also at the same time made the wall into an imposing and prestigious edifice, whose effect on the contemporaries could not have been unsuccessful. Where the impulse came from to build such a fortification remains unclear, not least because Archaic period mud brick walls are fairly rare in the Mediterranean area (e.g. Siris/Policoro in Lucania, Himera in Sicily, Rusellae/Roselle in Etruria). In particular, the impressively thick and close-together rectangular towers of the main approach side find no contemporary parallels south of the Alps.⁴³⁹⁹ Even though no clear proof can be produced, the mud brick wall of the Heuneburg is most likely connected at the earliest with influences from the Italic-Etruscan area, though Greek imports north of the Alps appear in considerable number only after the mid sixth century.

The Heuneburg's mud brick wall remains isolated and had no influence on Iron Age fortification types in Central Europe. This is not the case for artistic crafts, where during the Late Hallstatt period a transfer of ideas from the south took place. Toward the end of the sixth century, the first life size, three-dimensional human sculptures in stone appear north of the Alps.⁴⁴⁰⁰ The oldest representative of this group, the warrior of Hirschlanden (Kr. Ludwigsburg, Baden-Württemberg), was found at the foot of a burial mound

not far from the Hohenasperg near Stuttgart.⁴⁴⁰¹ With his thick, broad collar—thought to be made of gold—and conical headgear, he recalls the equipment of contemporary princely graves like Eberdingen-Hochdorf.⁴⁴⁰² The gesture of the forearms on the body with extended thumbs is found in the same attitude in central Italic statues like that of Casale Marittimo (province of Pisa) from the seventh century and Capestrano (province of L’Aquila) from the sixth century.⁴⁴⁰³ About a century later—already in the Early La Tène period (Lt A)—there appear the four warrior statues from Glauberg (Wetteraukreis, Hesse).⁴⁴⁰⁴ They originally stood beside a large burial mound that covered two princely graves of the LT A period.⁴⁴⁰⁵ One of these statues has survived the millennia almost undamaged, because it was (ritually?) deposited in a ditch, whereas three others were shattered in antiquity and remain only in pieces. The similarities are striking between the equipment of the princely Grave 1 and the features of the statue(s), which, except for the Mediterranean composite cuirass, all together were found *realiter* in the grave. In their frontality and their flat, shelflike form, from which spatial depth appears to be absent, these statues are not dissimilar to the earliest Aegean stone portraits, such as the Nikandre of Delos from the mid seventh century, which stands at the beginning of large stone sculptures in Greece. On the basis of the great temporal distance between the Nikandre and the Hirschlanden or Glauberg statues, these similarities cannot be explained as direct influence on sculpture north of the Alps from Greek works (let alone sculptors). Instead, it is likely that in both cases already distinctive types of images were transferred to another medium, as from wood to stone. The oldest cult images of the Greek world—called *Xoana*—are made of wood,⁴⁴⁰⁶ and also for Hallstatt-period Central Europe wooden sculptures may be postulated, which would have temporally preceded those in stone. Because of the perishability of the material, they have been preserved only in the rarest of cases, so that their development cannot be reconstructed.

Direct evidence of the presence of an Etruscan craftsman on the upper Danube might be provided by the mold of a figural handle attachment from the Heuneburg that shows a bearded Silenus head.⁴⁴⁰⁷ The form, based on Etruscan models, is made of native clay, so that an import can be excluded. The mold dates to the early fifth century and throws a characteristic spotlight on how closely artworks south and north of the Alps were bound up with each other—at least in individual cases—at the end of the Late Hallstatt period. The grooved wheel-made pottery of the Late Hallstatt period points in the same direction; it appears to be influenced at least partly by Etruscan pottery and bronze vessels.⁴⁴⁰⁸ The Etruscan-Italic influence in the Late Hallstatt period thus was not limited to the influx of prestigious luxury goods for the symposium.

The most common Etruscan imports north of the Alps remain the bronze vessels. In the case of the “Rhodian” bronze jugs,⁴⁴⁰⁹ the origin—not what the name suggests—remains controversial, though at least some come from

central Italy.⁴⁴¹⁰ Christopher Pare was able to make an Etruscan origin plausible for the jugs from Kappel-Grafenhausen (Ortenaukreis, Baden-Württemberg) and Inzigkofen-Vilsingen (Kr. Sigmaringen, Baden-Württemberg); both burials contained material characteristic of the Ha D 1 phase.

According to Krause, the basins and bowls with embossed rims found north of the Alps all belong to the later types, with the example from Chavéria being the sole exception.⁴⁴¹¹ This long-lived shape originated in the second half of the eighth century in central Italy but also was later produced elsewhere, as evidenced, say, by their massive presence in Greek colonies of Sicily and their hinterland. North of the Alps, aside from a few examples from central Bohemia, bowls with embossed rims of the Imola-Hundersingen and Hohmichele types are found only in the Late Hallstatt-period princely graves of southwestern Germany.⁴⁴¹² To be sure, morphological distinctions appear to indicate that most representatives of the Hohmichele type were based on a central Italic model and produced north of the Alps.⁴⁴¹³

Already in the middle of the nineteenth century, in Sainte-Colombe “La Garenne” (département Côte-d’Or), not far from the princely site on Mont Lassois, a Late Hallstatt princely grave produced a rod tripod and a cauldron with griffin heads.⁴⁴¹⁴ Such cauldrons were produced in Greece under Oriental influence beginning in the late eighth century and were among the most valuable dedicatory offerings of the Archaic period in Greek sanctuaries. Production began later in Etruria as well, which stylistically cannot always be satisfactorily separated from Greek pieces. At least the cauldron from Sainte-Colombe is probably of Italic-Etruscan origin, as indicated by its guilloche decoration, which in this form is not found on (western) Greek cauldrons, but is very common in Etruscan works,⁴⁴¹⁵ such as a bronze basin from the princely grave of Vix.⁴⁴¹⁶ Recently, though, Ulrich Gehrig has suggested that three of the four griffin heads on the cauldron were cast in a western Greek workshop, but the fourth is to be seen as a local product.⁴⁴¹⁷ Gehrig further supposes that the griffins did not originally belong to the cauldron, which further complicates the question of its origin. A similar bronze cauldron, onto whose shoulder originally griffin heads were riveted, was found in a deposit in Hassle (Kirchspiel Glanshammar, Sweden), together with two swords, two ciste, and twelve disks with concentric ribs.⁴⁴¹⁸ This vessel is also probably of Italic-Etruscan origin, even though here the heads are not preserved. Certainly the cauldron did not arrive so far north directly, but—as the materials found with it suggest—via northern Italy and the western Hallstatt area.

A bronze jug of the type *Plumpe Kanne* from Hatten in Alsace (département Bas-Rhin) represents a rarity north of the Alps.⁴⁴¹⁹ It can be connected with the more numerous Etruscan beaked flagons (Ger. *Schnabelkannen*), an example of which was found in the same grave. The handle merges above into a lion’s head, and below into a palmette crowned with an anchor.

Similarly unusual is the bronze amphora from Conliège near Lons-le-Saunier (département Jura), whose handles are decorated with siren handle attachments and horse heads.⁴⁴²⁰ The poorly preserved vessel, paralleled in Vulci and Bomarzo, lay in a grave from the end of the Late Hallstatt period (Ha D 3).

There are also occasional pieces of jewelry that find their closest comparison in Etruria—especially granulated and filigreed gold jewelry. Long known are a bead with halfmoon-shaped pendants from Jegenstorf (Bern canton)⁴⁴²¹ and another from Ins (Bern canton), which hangs on a chain woven from gold wire. Both pieces come from grave contexts of the Ha C 2 phase; at least the one from Ins is a product of a workshop south of the Alps.⁴⁴²² Recently filigreed spheres from a newly discovered princely grave near the Heuneburg can be added.⁴⁴²³

Occasionally there are even Italo-Etruscan bronze statuettes, e.g. in Vézelay (département Yonne), although for these pieces as well, the circumstances of their discovery appear doubtful. Not far from the princely site on the Ipf near Bopfingen at Wallerstein-Ehringen (Lkr. Donau-Ries, Bavaria) a bronze statuette of a nude boy was found in 1990.⁴⁴²⁴ It finds its best parallels in the Etruscan figurines of the Late Archaic and Early Classical periods and dates to the first quarter of the fifth century. According to Martin Guggisberg, it probably comes from the sphere of the Etrusco-Campanian bronze industry and was used as the top of a bronze cauldron.

3Early La Tène period (Lt A/B = ca. 450–280 BCE)

In the Early La Tène period, the importation of objects from Etruria into the region north of the Alps reached its peak. This is also consistent with the fact that in the late sixth century the Etruscans had broadened the reach of their power into the Po Plain and founded cities there, creating the basis for the increased transport of Etruscan objects to the north. Furthermore, it was primarily bronze vessels that were imported north of the Alps, customarily ascribed to the metal industry of south-Etruscan Vulci. Such prestigious goods appear to be concentrated in princely graves between Champagne and the Bohemian basin, especially in the Middle Rhine and Saar region, which beginning in the Ha D 3 phase, underwent dynamic development. Southwest Germany, still so dominant in Ha D, however, now strongly retreats and yields only a few Etruscan objects, e.g. from the burial chamber of the Kleinaspergle near Asperg (Kr. Ludwigsburg, Baden-Württemberg).⁴⁴²⁵

The “type fossil” for Etruscan imports of the Early La Tène period is represented by the bronze beaked flagons (*Schnabelkannen*) that were used for serving wine or other strong drink.⁴⁴²⁶ The oldest examples in Italy date to the last third of the sixth century. North of the Alps, they appear first in graves

of the Ha D 3 phase, e.g. in the princely grave of Vix,⁴⁴²⁷ and are especially common in princely graves of the Early La Tène period (Fig. 83.6). Typological distinctions can be brought out especially by reference to the form of handle attachment (anchor type, serpent type, volute type), from which it emerges that north of the Alps, jugs with volute handle attachments, rare in Italy, predominate. The great preference for this type of jug is also expressed in the fact that it was imitated in both bronze and clay, where the shape was not simply copied, but stylistically remodeled according to local tastes. Bronze jugs of this kind are known only from five findspots (Asperg “Kleinaspergle” [Kr. Ludwigsburg, Baden-Württemberg],⁴⁴²⁸ Dürrenberg near Hallein [Hallein, Salzburg],⁴⁴²⁹ Basse-Yutz [département Moselle],⁴⁴³⁰ Geisa-Borsch [Wartburgkreis, Thuringia],⁴⁴³¹ and Glauberg [Wetteraukreis, Hesse]⁴⁴³²). Out of the imagination of Celtic metalworkers was born also the beaked flagon from burial mound I of Weiskirchen (Kr. Merzig-Wadern, Saarland), which was put together from the bottom of a *stamnos* and the top of a beaked flagon.⁴⁴³³

Components of an Etruscan wine service likewise formed two-handled *stamnoi* with satyr handle attachments, which north of the Alps clearly occur less commonly than beaked flagons.⁴⁴³⁴ The largest concentration of such vessels, which were used from the end of the sixth into the fourth century, is observed between Lorraine and the Middle Rhine, a core region of the Early La Tène period princely grave custom.

Bronze sieves—known in Central Europe since the Late Bronze Age—in the Hallstatt and Early La Tène periods were only rarely part of drinking sets.⁴⁴³⁵ Aside from a few locally produced examples, the Etruscan straining ladle from Nonnweiler-Schwarzenbach (Kr. St. Wendel, Saarland) has long remained unique.⁴⁴³⁶ In the Mediterranean area, sieves were an indispensable banqueting utensil, since they were used to filter out the spices that had been added to the wine. It is certainly no accident that sieves found little acceptance north of the Alps. The native elites did imitate the Mediterranean drinking customs, but they altered them according to their own ideas. Thus they did not use the *infundibulum* (straining funnel) widespread in the Mediterranean,⁴⁴³⁷ or the “cheese grater” common in Italic graves and Greek sanctuaries, with which wine was sprinkled with cheese or other condiments.⁴⁴³⁸ This could also indicate that in Central Europe wine was not commonly consumed, but other intoxicants like mead or beer. Archaeobotanical investigations of the bronze jugs from the Glauberg indicate that at the time they were buried, they were filled with mead, as was the cauldron in the Hochdorf princely grave.⁴⁴³⁹ In the settlement of Hochdorf there are indications that beer was brewed there.⁴⁴⁴⁰ Greek or Italic wine must have flowed only relatively seldom down the throats of the local elites, even though it is still indicated as an important export to the Early Celtic “princely courts” of Central Europe.⁴⁴⁴¹

Fig. 83.6: Distribution of Etruscan beaked flagons (*Schnabelkannen*) (after Baitinger and Pinsker 2002, 52, fig. 29)

Flat, steep-sided bronze basins or bowls, some of which bear a circling decoration below the rim, were used for serving food.⁴⁴⁴² They often occur in graves in sets of two in different sizes. North of the Alps they are primarily

distributed in the Middle Rhine region and Bohemia (Fig. 83.7); the oldest representatives come from the Ha D 3 phase princely grave from Vix.⁴⁴⁴³ In Central Italy, such basins, which probably follow the basins with embossed rims (Ger. *Perlrandbecken*), were used from the end of the sixth to the beginning of the fourth century.

Distinct from these is a basin from the fifth or early fourth century, of which only one of the massive handles has survived, in the form of two wrestling youths. This handle, which goes back to Greek models of the Late Archaic period, was found in about 1855 near Nidda-Borsdorf (Wetteraukreis, Hesse), only about 12 km from the princely site on the Glauberg.⁴⁴⁴⁴ Wolfgang Kimmig has suggested that this piece represents the last remnant of an unnoticed destroyed princely grave.

Etruscan beakers are represented north of the Alps only by the examples from Ferschweiler (Kr. Bitburg-Prüm, Rhineland-Palatinate) and Bescheid (Kr. Trier-Saarburg, Rhineland-Palatinate).⁴⁴⁴⁵ Comparable vessels are known from Etruscan tombs of the second half of the fifth and the early fourth century. In Etruria, beakers were not used as drinking vessels but as ladles with which wine was served from a *stamnos*.

As in the Late Hallstatt period, there were also bronze vessels in the Early La Tène period, which occur north of the Alps only once. The amphora with a pointed base from Grave 1 at Nonnweiler-Schwarzenbach (Kr. St. Wendel, Saarland) displays a tongue-shaped ornament on the shoulder and crouching Silenuses on the handle attachments.⁴⁴⁴⁶ This item dates to the first half of the fifth century but was found in a grave of the Lt A period. The best comparison comes from Vulci, which can also be assumed to be its place of manufacture.

Fig. 83.7: Distribution of Etruscan bronze basins (after Schönfelder 2001, 324, fig. 8)

Also unique is an Etruscan *olpe* of Weber's type IIIB, which is said to have been discovered in 1897 in the *Riesenquelle* ("spring of giants") at Lahošť

(Okr. Teplice, Czech Republic) near Duchov/Dux in northwestern Bohemia, a decade and a half later than the famous Early La Tène bronze deposit.⁴⁴⁴⁷ The jug dates to the late sixth or first half of the fifth century and thus belongs to a series of Etruscan imports that reached Bohemia during the end of the Late Hallstatt and Early La Tène periods.

The rod tripod from Bad Dürkheim (Kr. Bad Dürkheim, Rhineland-Palatinate) was found in a princely grave of the Lt A period that was excavated unsystematically as early as the 1860s. It also yielded an Etruscan *stamnos*, which like the tripod was made in ca. 500 or in the early fifth century in Vulci.⁴⁴⁴⁸ These are the highest quality Etruscan imports found north of the Alps.⁴⁴⁴⁹

At the end of our list shall stand an equal-armed bronze precision balance, which was found in a settlement not far from the large burial mound of Eberdingen-Hochdorf.⁴⁴⁵⁰ Additional Mediterranean imports were uncovered there, specifically fragments of Attic red-figure vases and even remains of figs, as have also been detected in a settlement in Bad Nauheim (Wetteraukreis, Hesse).⁴⁴⁵¹ The Hochdorf scale beam is by far the oldest find of this kind north of the Alps, and judging by its size it was used for weighing precious metals or coins. It could indicate the adoption of Mediterranean systems of weights and measures, just as Lorenz Rahmstorf and Christopher Pare have interpreted a series of objects as a set of weights.⁴⁴⁵²

Etruscan-Italic influences can now be seen more strongly in artistic crafts. Stone sculpture has already been mentioned, and in the Early La Tène period there arose in Central Europe a new artistic style, both original and unconventional, whose repertoire of motifs was nourished by Etruscan-Greek roots and translated into a native-Celtic language of form.⁴⁴⁵³ After a long continuous phase in which the populations north of the Alps were confronted with imports from the Mediterranean area, with the Lt A period, these took on a new quality, launched independent developments, and made their mark on an age that directly predates the Celtic invasions of Italy.

Attic vases, on the other hand, in Lt A only occasionally reached the north, probably via northern Italy (Adria, Spina) and the Alpine passes. They are distributed in a broad arc from Champagne to Bohemia. From a settlement at Chržín (Okr. Kladno) in central Bohemia even comes an imitation of an Attic bowl.⁴⁴⁵⁴ Astonishingly, in Bohemia—unlike in southern Germany and eastern France—Greek vases and Mediterranean glass vessels have been found only in lowland settlements, while Etruscan bronze vessels except the Dux *olpe* come from princely graves.⁴⁴⁵⁵ In the late sixth and fifth centuries, Etruscan imports reached Bohemia in greater numbers.⁴⁴⁵⁶ From the fortified hilltop settlement of Vladař near Záhोřice (Okr. Karlovy Vary) in West Bohemia comes an anthropomorphic foot of a vessel in the form of a male figure wearing a helmet of the Negau type. Miloslav Chytráček thinks it is the foot of a *pyxis* made in northern Italy or the eastern Alps that goes back to Etruscan models.⁴⁴⁵⁷

With the Lt B 1 phase, the custom of princely graves disappears in Central Europe, so the number of Italic-Etruscan imports drops off significantly. Their general absence in the Middle La Tène period is thus attributed to the changed sources of transmission. Only with the Late Celtic Oppida civilization in the second and first centuries BCE did Italic goods arrive north of the Alps in renewed numbers.

The question is continually raised as to which goods served as return presents to the south for the Mediterranean imports,⁴⁴⁵⁸ without achieving agreement. Suggestions include raw materials (e.g. salt, gold, tin, amber), animal products (hides, leather, wool) or “manpower” (slaves). The basic question is certainly wrongly put, as long as little is known of the structure of the contacts. Did Etruscans and Greeks maintain direct relations with representatives of the Central European elites, which presupposes a *modus vivendi* with culture groups between origin and endpoint? Was it a matter of expeditions that daring traveling salesmen undertook at their own risk, comparable to the lucrative journey of the Samian Kolaos to Tartessos, reported by Herodotus (4.152)? Or were the prestige goods brought to the north by a chain of exchanges, perhaps promoted by gift exchange between representatives of local elites, which causes great chronological inconsistencies between the times of creation and deposition?⁴⁴⁵⁹ How varied the picture can be is shown by the sometimes highly heterogeneous cargos of ancient shipwrecks in the Mediterranean.

It must also be kept in mind that the political and social relationships, both south and north of the Alps, changed considerably during the period treated here. This also had repercussions on the preferred trade routes. In particular, Ludwig Pauli has tried hard to grasp the time span and the displacements of these routes.⁴⁴⁶⁰ Obviously the Alpine passes played a major role very early on, while the Rhône-Saône-Doubs route was meaningful especially in the Late Hallstatt period (Ha D 2/3).⁴⁴⁶¹ Across the eastern Alps, already in Ha C/ D 1 Italic imports reached Poland and northern and central Germany, which were probably sent north via Moravia and southwestern Slovakia, while Bohemia with the Moldau-Elbe route appears to have come more sharply into focus only in Ha D 2/3.⁴⁴⁶² One cannot help thinking of a literal connection with the transport of amber, which was traded from the Baltic Sea to the south and that was transformed south of the Alps into gorgeous pieces of jewelry in centers like Verucchio.⁴⁴⁶³

4 Concluding remarks

It may be stated in conclusion that occasionally beginning in the Late Urnfield and Early Hallstatt periods, and more so in the Late Hallstatt / Early La Tène periods, central Italic–Etruscan imports reached the area north of the Alps.

They played an important role for the native elites, who also legitimated and distinguished themselves through the possession of such prestigious objects and endeavored to create a network of relationships and dependencies through their exchange with each other.

A considerable portion of the imported materials is connected with eating and drinking equipment and thus with festive elite symposia. Indeed the spectrum of imported tableware—such as Greek vases—is limited and in no way comprises the entire bandwidth of what was needed for a symposium in the Etruscan-Greek area. Equipment like “cheese graters” or straining funnels, which were needed for spicing wine, are not found north of the Alps, obviously because beer and mead were preferred; roasting spits and firedogs are also rarely found. Instead, containers for liquids and barware predominate, such as beaked flagons (*Schnabelkannen*), which toward the end of the Late Hallstatt period and in the Early La Tène period become a “type fossil” of Etruscan imports north of the Alps. With the increased arrival of Mediterranean goods in the north, increasing influence on native artistic crafts becomes noticeable, manifested in the emergence of the Celtic La Tène style, the development of stone sculpture, and the imitation of Etruscan bronze vessels (e.g. beaked flagons, mold from the Heuneburg). How deeply these influences might have affected daily life is shown by the appearance of the potter’s wheel (grooved wheel-made pottery), the adoption of Etruscan fashion (colored cloth, pointed shoes), the consumption of dried fruit from the Mediterranean area (remains of figs), and the use of a precision balance as in the settlement of Hochdorf. Other aspects can be adjudged only with difficulty, as they mostly elude archaeological proof, such as the cut and decoration of clothing. It is therefore not surprising that opinions in the scholarly world differ on how deeply Mediterranean-Etruscan influences were felt in Central Europe.

From the beginning, the Trans-Alpine communication routes above all appear to have possessed special significance. On one side, they ran via the western Padan Golasecca culture, on the other via the eastern Alps and through Bohemia/Moravia to Silesia, on routes that must have largely followed the legendary “amber road.” Beginning in the second half of the sixth century with the rise of Massalia/Marseille, the route via Rhône, Saône, and Doubs became increasingly significant and brought Mediterranean imports to eastern France and southwestern Germany. The contacts reached their apex in the Late Hallstatt and Early La Tène periods, as Etruscan and Greek imports belonged among the indispensable components in princely graves of the native elites. With the abandonment of the custom of princely graves in Lt B 1, the number of Etruscan objects diminishes greatly. At the same time, Celtic bands were advancing on central Italy and were conquering Rome in 387 BCE. We then arrive at a historical turning point that is no longer the topic of this article.

VI. Etruscans outside Etruria

Etruscan Finds in the Mediterranean

Olivier Jehasse

84Corsica

Abstract: Greek and Latin literary sources, ancient inscriptions and archaeological finds show that the relationships between the island of Corsica and the Etruscans were uninterrupted from the Iron Age to the Middle Republican period. The role of the Corsica is stressed by the mentioning of the island in the three treaties between Rome and Carthage.

Keywords: Kurnos, Aleria, Alaliè, Phocaeans, Etruscans

1Before the Etruscans

The history of Corsica and Etruria is that of two regions that have long been entangled in a fruitful network of large strategic relationships. Off the coasts of what was to become the Tyrrhenian Sea and during fruitful prehistoric times, Corsica had developed a highly developed rural civilization.⁴⁴⁶⁴

But Corsica is also the land of “Korsois,” a name that may be related to the myth of the girl Corsa, who came from Liguria to occupy the island. Another ancient etymology claims that the word Korsè is derived from the word Korsas—the “forested crests” quoted from Denys the Periegetan.⁴⁴⁶⁵ Thus, it was a useful territory at the disposal of the Etruscans when they emerged as a political and maritime power around the ninth century BCE.

Two kinds of sources condition the knowledge of this early period—the archaeological explorations of the prehistoric sites, and a written source dealing with the moves of Etruscan populations toward the shore.

Between 1500 and 800 BCE, the relations of the islanders with foreign lands broadened, both with the northern and eastern countries, specifically with the major Mediterranean islands. A bronze ingot from Cyprus shaped like a oxhide was discovered in Borgu, south of Bastia. Dating back to the seventeenth century, this type of object was well known in Italy and in nearby Sardinia, and is evidence that in Corsica the dealers’ and merchants’ had contacts with the far Western countries. A bronze fibula resembling a violin bow from eleventh century Sicily, shows that the relations were broadly opened to the whole Tyrrhenian basin⁴⁴⁶⁶. The presence of amber remains on the mountain site of Cucuruzzu in Levie in southern Corsica, together with a hypogeum of the Early Bronze Age in the area of Aleria on the eastern coast, attest that products from the Baltic penetrated the civilization of the *casteddi* that had been created in the previous centuries. The *casteddi* are fortified villages built in the valleys in order to control access to the beaches, the sea

and the roads leading to the peaks of mountains. The coincidence between the number of sites registered by the archaeologists and that mentioned in the classical sources (thirty-three, thirty-two or twenty-four—it varies according to the writer⁴⁴⁶⁷) is quite impressive.

In the Bronze Age ceramics copied the decorative motifs of the cultures from highland Italy, dubbed the Apenninic culture of Central Italy. The presence of stelae statues in arms is evidence that much stronger hierarchic features were developing in this society. The erect stelae are turned into real statues, with clearly depicted faces and varied expressions, and carefully decorated on both sides. The type of armament with which they are portrayed is definitely new and is linked to the increase in the number of Bronze Age weapons in continental Europe. Stelae statues can be found alone or in clusters and they are present in the *casteddi*. A large collection of bronze axes from several findspots reveals steady work in the mountain forests. And in this area of bronze-users one can note the widespread usage of adornment items for dress, such as fibulas, humble or showy hooks—more than 100 hooks have been recorded—buttons and solar rings. In the Bronze Age the metal was probably worked locally, not only thanks to the island's resources but also because foreign models were very often imitated and reproduced. The number of remaining stone molds supports the theory that these early Corsicans had thoroughly mastered the metal melting technique.⁴⁴⁶⁸ The high standard of metallurgic development is one of the major characteristics of the time and is no doubt the source of the relationships between the Etruscans and the island.

A text by Servius deals with the relationships between the Etruscans and Corsica. He relates that in the tenth–ninth centuries, “according to some people, after the twelve peoples from Etruria had already settled, Populonia was built by a people from the island of Corsica in Italy; for others it was a colony that belonged to the inhabitants of Volterra; still others claim that the inhabitants of Volterra had torn Populonia away from Corsican people.”⁴⁴⁶⁹

As early as the first centuries of the first millennium, this narrative stresses the structured presence of the islanders also out of the island and emphasizes a period of conflict over Populonia, which exploited the iron of Aethalia/Elba. This antagonism between the citizens of Volterra, a blossoming city, and the Corsi, whose attacks against each other in order to gain full control over this haven that connects all the commercial roads of the Mediterranean, is exemplary. And if this reveals a defeat for the islanders, it nevertheless did not put an end to their relationships with the Tyrrhenian Sea.

2The eighth–seventh centuries BCE

The development that began at the end of the second millennium saw a rapid

increase beginning in the eighth century, evidenced by the history and archaeology of Alaliè/Aleria, a large site on the island's eastern coast. This ancient site has recent been recognized as a real and own city at the center of the island's foreign relationships and a place which is characteristic for the whole island. We may assert, today, that the city receives external incomers only once the islanders have built it. It is not boiled down to a settlement in a specific place but it is, indeed, a site widely opened to the ancient Tyrrhenian. The town is backed up by a network of modern features. A road led to the island's south and two ports are in full play—the first of two ports is Tavignani, known in ancient times as Rhotanos (“the large and navigable river,” as the Rhodian sailors called it), the second one is on the northern bank of the pool of Urbinu, terminus of the archaic road.

This period corresponds to the erection of what Jean and Laurence Jehasse call the West Monument: this was a complex mix of architectural techniques. On a foundation of boulders, the walls are built with stones and carefully selected clay, including also elements of wood.⁴⁴⁷⁰ Here have been discovered stamped ceramic from the first millennium, *bucchero* and Etruscan amphorae from the seventh century, Punic ceramics, ceramics from eastern Greece (Ionia and Rhodes), and from the Euboean territory, as well as fibulas and molded ceramics made in Corsica. This first building appears as an adaptation of the model of the *casteddi* found in the island's other regions.

3The sixth century BCE

This century saw two great moments of evolution that directly affected the Etruscan world. According to Antiochus, it was under the leadership of Créontiadès that the Phocaeans went west—first to Massilia, and then to Kurnos.⁴⁴⁷¹ He would have sailed between Massilia and Alaliè between 600—the date of Massilia's foundation—and 565 BCE, the date when the first group of Phocaeans settled in Alaliè. Their settlement is well known because it is briefly described by Herodotus, who asserts that the Phocaeans “have raised the walls of a city named Alaliè.”⁴⁴⁷² Through archaeological exploration, we recognize mud brick superstructures, erected on top of a building from the previous period, similar to the pattern of ancient Hellenic fortifications. Behind a wall making a defense at the hillock, a series of probably military constructions made by earth with timber floors is standing; this hybrid defensive wall seems characteristic of an early stage of the warfare developed by the Greeks.

The arrival of a second group of Phocaeans in 545, a more expansionist group of pirates, gave a new impulse. Once more, according to Herodotus, in 540, “the Etruscans and the Carthaginians, in accordance with a concerted plan” prepared an expedition against the Phocaeans. The diplomatic and

military arrival of the Etruscans happened for two reasons—because of the dangers that threatened the maritime roads under the command of Caere (so that this city was directly concerned with these events), and because of the antiquity of the relationships in the western Mediterranean among Etruscans and Carthaginians. The Etruscans intervened because they couldn't leave this territory—which had become essential to their development—under the control of others. On Corsica and the Tyrrhenian Sea, the battle mobilized all of the powers at the only crossing of the east-west roads of Etruria at Tartessos in southern Spain, and the north-south roads between Sicily and Marseille, Sardinia and the Languedoc. This throws a new light on Herodotus's phrase "Cadmean victory," where the reference to Cadmus, the founder of Thebes, must be interpreted as an attempt to convey that these events ended up in a genuine negotiation, and a great treaty between the different protagonists. Caere's Etruscans flouted the treaty, but it allowed the Phocaeans to gather their goods and choose a new destination. This clearly suggests a certain diplomacy and a fundamental role played by Etruscan towns in the island's history.⁴⁴⁷³

If the role of Caere in Corsica seemed diminished after the battle, it is almost certain that Volterra, Tarquinia, and Etruscan Rome would have greatly benefitted. This is what the study of the *bucchero* found in Corsica continues to prove, the majority of registered items from this period being *bucchero pesante* produced in the interior of Etruria. Its presence in Corsica has naturally led scholars to believe that it was circulated via the great Etruscan ports of the sixth century.

4540–506: the Etruscan domination

Having become the "masters of the towns of Kurnos" according to Diodorus of Sicily,⁴⁴⁷⁴ which that is to say masters of the places from which the founding fathers of the first Alaliè originated, the Etruscans, as international victors, exploited Corsica thanks to an elaborate fiscal policy of drawing "tribute from resinous trees, wax and honey." This was the reason for the growth of the city of Alaliè. Some modern scholars mention the possibility of the existence of a temple overlooking the plain to the west, a theory supported by the fact that a statue of a lying lion was discovered. Thanks to their research at the back of the fortifications, they also stress the presence of a suburb organized around an East-West street, divided into two groups of small houses, which abutted the fortified edifice.⁴⁴⁷⁵ It was here that Etruscan, Punic and Ionian artifacts, and black-figure Attic ceramics from Athens, were discovered. The local productions are the best represented ones in the series of ceramics found at this fortification, and they reflect the richness, as shown by the building of the first monumental tombs of the necropolis around the end of

the century.

5The necropolis of Alaliè

Archaeologists have accurately analyzed the structures and furnishings that have been discovered, dating them to three periods—from the sixth–fourth centuries, from 350–259, and from 259–150 BCE.⁴⁴⁷⁶ The richness of the finds—including ceramics, stones, molten glass, bone, bronze, silver and gold—from the first two periods has been crucial to answering questions about the social organization and the values of the inhabitants of the city.

The tombs are monumental, with halls leading to antechambers shut by mud brick doors that separate them from the funeral rooms, which have three benches around a central pit. This kind of tomb is original in itself, but is closely linked to Etruscan models. It is the richness and the variety of the furnishings discovered that illustrates the connections between Mediterranean cultures and the interests and needs of the Corsican people. There were clearly many such connections since items from Etruria, Carthage, Athens, Iberia, Celtic countries, Latium, and Campania have been identified along with a high percentage—around 30% on average—of local ceramics, made according to traditional techniques. The bronze finds, jewels, helmets, gold and graffiti suggest that between 530 and 475 BCE, the necropolis was Etruscan. This phase corresponds to the presence of a group of Etruscans particularly active in the city of Alaliè. The collected graffiti show a predominance of Etruscan writing in the city.⁴⁴⁷⁷ Moreover, the belonging to the Etruscan world is historically confirmed by the role Corsica acquired in the first treaty between Rome and Carthage (509–508 BCE),⁴⁴⁷⁸ which significantly arrive at this period.

Corsica is mentioned in the three treaties between Rome and Carthage, and Servius calls it “neutral ... between the Romans and the Carthaginians.” It is certain that Etruscan hegemony was not limited to the territory of Alaliè, but had a presence in all of the key coastal sites—and no longer only on the eastern coast, with an settlement n the north surrounding what would become Roman Mariana, in the south with one or two settlements northwest of Balagna in the Gulf of Porto Vecchio, and in the southwest in what would become the Roman port of Tizzanu, which faces Sardinia. Hezychius explains the name of Kurnos with a twofold etymology—that of Kurnos, the son of Hercules, and that of *Kurniata*, which he defines as the most ancient Etruscan anchorage. Hence, we discover once more the essential link between the international politics carried out by the Etruscan confederation and its permanent use of exchanges and economic development.

6506–420 BCE: the place of Corsica in the international political issues at stake

Nearly thirty years after the treaties, in 480 BC, Herodotus writes that “an army including Phoenicians, Libyans, Iberians, Ligurians, Elisyches, Sardonians, and Kurnians amounting to 300,000 soldiers under the command of Hamilcar, the son of Hannon, the king of the Carthaginians” fought in the battle of Himera. This battle, in which the Greeks and Syracusans managed to ward off Etruscan pressure from the Sicilian coasts, was a major turning point in the history of Etruscan and Corsican relations, which can be checked thanks to the archaeology of Alaliè.

What is surprising in the Syracusan politic is that, once again, the goal was not to take hold of the city, but merely to gain politic control over it, which happened for the first time in 458. According to Diodorus, Himera was under the reign of Hieron when the Syracusans suddenly rebelled against Etruscan domination in the occidental Mediterranean area and sent Apelles and a fleet to the Tyrrhenian Sea. Apelles attacked Etruria and Corsica, taking “back a great number of prisoners and tremendous spoils.” With such an achievement, Syracuse asserted itself as the most powerful Hellenic power between the Italic peninsula and the islands of Corsica and Sardinia. Thus, Syracuse was slowly able to increase its control over Himera’s inhabitants, once Etruscan power had been hard hit. The East Monument in Alaliè was built according to the new Greek models, and was meant to be seen from the sea. Built to secure a defensive presence, this monument seems to be the work of a power that had succeeded in overcoming the Etruscans. The fortress demonstrates an evolution of the architectural standards. Resting on beds of well cut stones, it is testimony to a knowledge of the earth and brick used for a military building, and features a spectacular new innovation— a high dungeon tower that overlooking the entire site, clearly visible from the sea and land. The monument dates to the fifth century, but it is also obvious that the previous structures have merely been complemented by the addition of this monumental realization.

This is ascertained by a number of things—first, by the uninterrupted presence of dwellers in the houses behind the West Monument; second, by the discovery of the metallurgic zone on the other side of the plateau; and above all, by the extraordinary expansion of the necropolis, whose richness increased constantly with each passing generation. Indeed, between 475 and 420, the presence of Athens was felt, along with that of Naples—a former ally of the Etruscans—and Syracuse. The tombs from this period are rich as they were before, and featured items and adornments such as stone burial markers (It. *cippi*) from the region of Pisa, Iberian belt clasps, and iron swords with a clear Celtic influence. The tombs of two men contain drinking cups with Etruscan inscriptions. The first, *Kaile* from the *gens Caelia*, died in Aleria

between 450 and 425 BCE. The death the second, *Klavtie* from the *gens Claudia*, is dated by a graffito to 425 BCE. And we deeply feel that the Roman vision is changing. Plutarch wrote that “when the Romans were warring against the Etruscans, they elected Valerius Torquatus general. When he beheld the king’s daughter, whose name was Clusia, he asked the Etruscan for his daughter; but when he failed to obtain her, he attempted to sack the city. Clusia threw herself down from the battlements; but by the foresight of Venus her garment billowed out, and she came safely to the ground. The general violated her, and for all these reasons was banished by public decree of the Romans to Corsica, an island off Italy. So Theophilus in the third book of his *Italian History*.”⁴⁴⁷⁹

During the fifth century, when Rome decided to make its authority felt in Etruria—and more specifically in the territory of Chiusi—the first name of the king’s daughter can be recognized in the city’s name. Chiusi, a new Etruscan city, intervenes in Corsica’s history, a fact that the study of *bucchero pesante* in the previous century had already hinted. It is doubtless that the quotation of the Roman presence in the island is connected to later events.⁴⁴⁸⁰

7The fourth century BCE

7.1384–345 BCE: The Etruscan weakening

A notice written by Diodorus that dates to between 378–377 BCE ascertains the Roman interest for Sardinia, when he recalls that during those years “the Romans sent 500 settlers to Sardinia, freeing them from taxes.” Even though it is better to define the word “settlers” as “entrepreneurs,” the notice confirms the pursuance of the exchanges provided for in the first treaty between Rome and Carthage, which already mentioned potential mercantile exchange in Sardinia. Rome was not an Etruscan city any longer, but an autonomous power, eager to build new policies in full accordance with its own interests. Theophrastus, during the first half of the fourth century, relates: “But largest of all, they say, are the trees of Corsica; for whereas silver-fir and fir grow in Latium to a very great size, and are taller and finer than the silver-firs and firs of South Italy, these are said to be nothing to the trees of Corsica. For it is told how the Romans once made an expedition to that island with twenty-five ships, wishing to found a city there; and so great was the size of the trees that, as they sailed into certain bays and creeks, they got into difficulties through breaking their masts. And in general it is said that whole island is thickly wooded and, as it were, one wild forest; wherefore the Romans gave up the idea of founding their city; however some of them made an excursion into the island and cleared away a large quantity of trees from a small area, enough to make a raft with fifty sails; but this broke up in the open sea. Corsica then,

whether because of its uncultivated condition, or because of its soil and climate is very superior in trees to other countries.”⁴⁴⁸¹

The interest of Rome and the history of Etruria proves that Etruscan power had been seriously weakened on Corsica. The pressures from Rome, Carthage and Syracuse—once more—bear over the evidence of it.

Indeed, Syracuse’s influence was always present. In 384, Denys of Syracuse led a successful naval expedition against the Etruscans in Corsica. Corsica’s “Syracusan port,” located in the Gulf of Porto Vecchio, was subsequently created on the very place where there had previously been a *kurniata*, mentioned by Diodorus. Likewise, the appearance of a *Charax*—a small fort that would have been erected on the southern piedmont of the territory of Alaliè and is mentioned in Strabo’s *Geography*—might suggest the establishment of a structured strategic and economic cohesion after that victory. But the Syracusan presence is soon confronted with other cities, like Carthage, which would react not only in Sicily but especially in Sardinia, where its political presence was ever stronger, Naples and Campania, and above all Tarentum, whose role become even more important. As for the Etruscan cities, their indifference to the destruction of Veii, the extinction of Caere as a political power and the strengthening of the links between Tarquinia and Rome suggest that the Etruscan nation was no longer able to claim a strategic role, but went on exercising a well-defined commercial and cultural influence.

This influence is illustrated by the second phase of the necropolis and the superstrata of the two monuments on Alaliè’s plateau. Local items were still produced but the genuine Etruscan items were, from then on, in competition with products mostly from Rome, but also from Latium, Campania, and even Carthage, and as a result, the imports from Syracuse and Athens dried up. More precisely, the former group of partners, which included Tarquinia, Caere and Rome, was replaced by cities from Central and Southern Italy. This, however, did not alter the general richness of Alaliè in any way. The necropolis was indeed in full use during the fourth century. According to J. and L. Jehasse between 350 and 259 BCE, all the funerary interments contained Etruscan and Roman items, such as the Etruscan red-figured stemmed plates of the *Genucilia* class from Caere, or black-varnished cups of the “atelier des petites estampilles” from Rome. And from the Greek world, only Campania and the region of Tarentum had a close relationship with Alaliè, but this did not prevent the continued Etruscan cultural influence.

Six Etruscan graffiti and a collection of bronze mirrors, which are likely linked with Tarquinia,⁴⁴⁸² are the final clear evidence of the quality of the relationships between the inhabitants of Alaliè and the Etruscan cities.

7.2345–300 BCE: A world on standby

The second half of the fourth century shows a world on standby. On one side, as an obvious sign of the transformations still in progress, Carthage and Rome signed a new treaty that laid out an alliance and the organization of their respective areas. Polybius transmits a version that dates to 348 BCE. After the first treaty in 509–508 BCE, the Carthaginians signed a second, in which the Kurnians and the people of Utica were included. To the Fair Promontory quoted in the first treaty (probably just north of Carthage) are added Mastia and Tarseo, the boundaries beyond which, as it is stated, the Romans should neither sack nor found cities. Here is the text of the treaty without any frills: “In accordance with these conditions, the friendship between the Romans and their allies, and the peoples of Carthaginians, of Kurnians, and of the inhabitants of Utica and their allies is secured. The Romans will not proceed to sacks, will not trade and will not found cities beyond the Fair Promontory of Mastia and Tarseiou.”⁴⁴⁸³

The recognition of the Kurnians’ political weight generated, among other things, a reduction in the number of the historical protagonists. Former partners—Carthage and Rome—became enemies, and from then on were the only powers who may attempted to dominate the Tyrrhenian geographical area. The years that preceded the expeditions of Pyrrhus—the king of Epirus—show that in this area occur the events which will deeply change the previous equilibriums.

8300–259 BCE: The joint pressure of Rome and Carthage

Here again it is the history of the necropolis that offers the greatest amount of information, the archaeological knowledge about that period being still full of gaps. In the tombs that belong to the third phase of utilization, we observe a still-visible Etruscan presence. Etruscan was still spoken in Alaliè in the third century, as may be seen on thirteen graffiti datable to between 300 and 275 BCE.⁴⁴⁸⁴ The name of a Roman woman—Titula—has been discovered in one graffito at the center of a highly important funereal deposit. Although it has Latin origins, it still used the Etruscan alphabet. Later, between 275 and 250 BCE, the name *Klutius* appears, more testimony of a person of rank from the *gens* Claudia, even if the spelling of the name seems hesitating and is probably connected with the Etruscan writing of the Latin name. In the burials, items from Latium, Campania, and the region of Tarentum have been found. Evolving international relations were deeply felt. The Punic presence got stronger, based on the Sicilian coins from between 344 and 280 BCE that have been found, and with imports from Iberia. At that time even eulogies evolved, and rites as well as ornamental themes of the pieces of furnishings changed. Furthermore, the last tombs were dug during the second half of the

third century, when Corsica was at war and Alaliè had become the anchoring-ground of the Roman conquest. Consequently, the end of the Etruscan era in Kurnos dates to between 280 and 260 BCE.

To conclude, it is useful to provide an excerpt of book 5 of Diodorus of Sicily's *Historical Library*, which appears to be the clearest synthesis of the different moments the Etruscans and the Corsicans knew during the six centuries of their common history.

"After Aethaleia there is an island, some three hundred stades distant, which is called Cynus by the Greeks, but Corsica by the Romans and those who dwell upon it. This island, being easy to land on, has a most excellent harbour which is called Syracosium. There are also on it two notable cities, the one being known as Calaris and the other as Nicaea. Calaris was founded by Phocaeans, who made their home there for a time and were then driven out of the island by Tyrrhenians; but Nicaea was founded by Tyrrhenians at the time they were masters of the sea and were taking possession of the islands lying off Tyrrhenia. They were lords of the cities of Cynus for a considerable period and exacted tribute of the inhabitants in the form of resin, wax, and honey, since these things were found in the island in abundance. Slaves from Cynus are reputed to be superior to all others for every service which the life of man demands, nature herself giving them this characteristic. And the entire island, which is of great extent, has mountainous land over much of its area, which is thickly covered with continuous forests and traversed by small rivers."⁴⁴⁸⁵

All data concerning the history that is summarized in this chapter show the uninterrupted relationships between the Etruscans and the island of Corsica from the Iron Age to the Middle Republican period.

85Sicily

Abstract: Geographic location is undoubtedly one of the elements that most affects a region's history. The central position and triangular shape of Sicily projected into the Mediterranean in such a way as to facilitate different contacts with the ethnic groups that populated it. For example, the northwestern point (the Phoenician-Punic hub of the Island) was naturally involved in the maritime routes between the Tyrrhenian world and northern Africa, and in the same way, the Aeolian archipelago was of crucial importance for the control over the lower Tyrrhenian Sea and transit towards the straight of Messina.

Contacts between the indigenous populations of Sicily (Sicani, Siculi, Elymi) and the Tyrrhenian part of the Italian mainland date back to the Proto-historic period, but they increased in frequency and changed in nature from the eighth century BCE, after the foundation of the Greek and Phoenician colonies on the island's coasts.

Keywords: Sicani, Siculi, Elymi, Greeks, trade

Introduction

Geographic location is undoubtedly one of the elements that most affects a region's history. The central position and triangular shape of Sicily (**Fig. 85.1**) projected into the Mediterranean in such a way as to facilitate different contacts with the ethnic groups that populated it. For example, the northwestern point (the Phoenician-Punic hub of the Island) was naturally involved in the maritime routes between the Tyrrhenian world and northern Africa, and in the same way, the Aeolian archipelago was of crucial importance for the control over the lower Tyrrhenian Sea and transit towards the straight of Messina.

Contacts between the indigenous populations of Sicily (Sicani, Siculi, Elymi) and the Tyrrhenian part of the Italian mainland date back to the Proto-historic period, but they increased in frequency and changed in nature from the eighth century BCE, after the foundation of the Greek and Phoenician colonies on the island's coasts.

1The literary and epigraphic sources

The key position of the Aeolian (Lipari) Islands allows us to understand why several conflicts between the Greeks and Etruscans crystallized around them,

in a complicated relationship that is referred to in the historical sources (Diod. Sic. 5.9.4–5; Strabo 6.2.10; Paus. 10.11.3–4; 16.7; Callim., fr. 93) and is also reflected in the mythological legend of the brothers Tyrrhenus and Liparus, who became mutual enemies (Serv., *ad Aen.* 1.52).

Lipari. 12. Marsala. 13. Megara Hyblaea. 14. Mendolito di Adrano. 15. Messina-Zancle. 16. Milazzo. 17. Mineo. 18. Montagna di Marzo. 19. Monte Bubbonia. 20. Monte Chibbò. 21. Monte Iato. 22. Monte San Mauro. 23. Morgantina. 24. Motya. 25. Mura Pregne. 26. Naxos. 27. Palermo. 28. Pantalica. 29. Paternò. 30. Poggioreale. 31. Polizzello. 32. Punta Braccetto. 33. Ramacca. 34. Sabucina. 35. Selinunte. 36. Syracuse. 37. Sòlanto. 38. Terravecchia di Cuti. 39. Ustica

One of the most debated problems for the eighth century is the historical reliability of the well known passage of Ephorus (in Strabo 6.2.2), which mentions the presence of Tyrrhenian pirates in the waters off Sicily's east coast prior to the foundation of the Greek colonies.

Although the connection between Etruscans and piracy is a leitmotif of official propaganda in Greek historiography, it probably masks the reality. It is known that piracy in the Archaic period had a double value: one, political-military, which related to organized forms of naval control in strategic areas; and the other, economic, as an activity connected to commercial transactions.

Fig. 85.2: Types of bucchero vases from Sicily: a–b. Kantharos and chalice (Megara Hyblaea, after Gras 1985, figs. 78, 72, no. 695)

In the Tyrrhenian area the situation radically changed at the beginning of the fifth century, when Hieron, the tyrant of Syracuse, defeated the Etruscans in the waters off Cumae (Diod. Sic. 11.51; Pin. *Pyth.* 1.140), a battle archaeologically attested by the inscribed Etruscan helmets which were dedicated by Hieron in Olympia (Fig. 87.2). The Syracusan fleet reached Etruria during the course of the fifth and fourth centuries, focusing on the mineral rich Etruscan coastal area of Elba.⁴⁴⁸⁶

The Latin inscriptions on marble tables at Tarquinia, dedicated to members of the Spurinna family in the first century CE who were known as “Elogia Tarquiniensia,” represent an important late Etruscan source. Among them, the one that refers to Velthur Spurinna appears to be especially important because it has been interpreted as a reference to the captain of the small Etruscan fleet that was sent in 413 BCE as allies of Athens against the common enemy

2The relationship between Sicily and the Tyrrhenian Sea

The interrelations in the Tyrrhenian Sea in the Archaic period are extremely complicated due to the ethnic diversity of the actors involved—Levantine, Greeks, Etruscans, Italics and Nuragics. The recent growth of archaeological documentation and new historical and methodological research has led to a better understanding of the exchange relationships, and has reminded us to be more cautious when attempting “global” interpretations. On the one hand, the interpretative fragility of modern notions—such as “Greek commerce,” “Phoenician commerce,” and “Etruscan commerce”—has been acknowledged, especially when considered in isolation. On the other, the complex nature of ancient trade—which was often conducted through multiple mediations, along long-distance routes that were followed with numerous calls along the way, in which “goods” were loaded and unloaded—has been clarified.⁴⁴⁸⁸

The latter conclusion is supported by the shipwrecks, the cargoes of which are often characterized by products of different origins and areas of production. In the case of Sicily, the archaic shipwreck of Gela I, which dates to the first quarter of the fifth century, is paradigmatic.⁴⁴⁸⁹

The legendary episode of Demaratus of Corinth, who moved to Tarquina, is exemplary of the commercial practices of the seventh century. According to Dionysius of Halicarnassus (*Ant. Rom.* 3.46.3), Demaratus carried out his trade in western waters, “transporting Greek goods amongst the Tyrrhenians and Tyrrhenian goods amongst the Greeks.”

The history of the contacts and exchanges between Sicily and the middle-Tyrrhenian area, where the important Tuscan-Latium mining district is located, predates the Archaic period. The possible trade of raw or semi-worked metals (witnessed by the ingots of copper and lead found in the shipwreck off the island of Giglio, which dates to the beginning of the sixth century) is indirectly documented in Sicily for the first half of the eighth century by the import of finished products from central Italy (axes from the hoards at Polizzello, Monte San Mauro and Pantalica).⁴⁴⁹⁰

Ethnic mobility between Tyrrhenian Italy and Sicily was a complex phenomenon in the proto-historic and Archaic periods. It is important to remember that the ethnic identity of an individual is not easily discernable from an archaeological point of view. In this regard, some hints could derive from the rare sanguisuga and navicella fibulae of Italic type, which belong to the eighth and seventh centuries, and were found in Sicily at Giarratana, Megara Hyblaea, Mendolito, Milazzo, Mineo-Tre Portelle, Motya, Pantalica,

Paternò, Syracuse, as they are typical of certain clothing styles (especially female).⁴⁴⁹¹

The indications contained in the epigraphic documentation, albeit few in number, are more secure. Two persons with Etruscan names—*Romis*, son of *Kailios*, and a woman named *Turranâ*—are mentioned at the beginning of the fifth century on two lead sheets found at the sanctuary of the Malophoros at Selinunte. Each has a different social status and their presence is not surprising in a colony where Etruscan imports are documented from the seventh century. A Greek funerary inscription dating to the end of the sixth century, perhaps from Selinunte itself, has been read as follows: “I am Latinos. I am the son of Rheginos.”⁴⁴⁹²

3 The fine ware and the transport amphorae

The earliest imports of Etruscan pottery in eastern Sicily are attested in the first half of the seventh century. They are dishes with a sub-geometric decoration, also known as “ad aironi,” which were first produced in Caere in the first half of the seventh century BC, and have been found in Gela, Helorus and Syracuse (Fig. 50.8).⁴⁴⁹³ From the last quarter of the seventh century, a qualitative and quantitative growth in materials of Etruscan production in Sicily occurs, which includes not only fine table ware but also transport amphorae. Besides Caere, Vulci also assumes a primary role in this commercial trade.

Among the earliest pottery in bucchero it is worth mentioning two kantharoi with incised decoration from the settlement of Megara Hyblaea and from the sacred area of Naxos, linkable to fabrics from the area of Veii-Caere that are datable to 640/30. The bucchero vases with incised fans, dated to the seventh century and reported at the colonial sites of the eastern coast of Sicily (Leontini, Megara Hyblaea, Messina) and at Himera (linked with the commercial traffic between Etruria and northern Africa), could also come from the area of Caere, even if it is not possible to exclude other southern Etrurian centers of productions, such as Vulci.

The systematic analysis of the bucchero imports of a colony such as Megara Hyblaea has demonstrated that an extensively excavated settlement provides different shapes of vases (*kylikes*, *chalices*, *olpai*, *oinochoai*) and not only kantharoi, which are mainly attested in funerary contexts (Fig. 85.2a–b).⁴⁴⁹⁴

It is between the end of the seventh and the first half of the sixth century that the bucchero kantharos of transitional type (Rasmussen type 3e) becomes the preferred product among imports of fine table ware.⁴⁴⁹⁵ It constitutes a real fossil-type of Etruscan commerce in the Mediterranean in this period (Fig. 49.2). It is a standardized shape, for which it is difficult to identify

production centers without the aid of petrographic analyses.

In Sicily, the distribution of kantharoi of this type is prevalent in the Greek colonies and sub-colonies (Camarina, Helorus, Gela, Himera, Leontini, Lipari, Messina, Megara Hyblaea, Naxos, Selinunte, Syracuse). Only a few specimens are known in Punic sites (Marsala, Motya, Palermo, Solunto). Their presence in indigenous centers is also seemingly scarce (Colle Madore, Monte Castellazzo di Poggioreale, Monte Iato, Monte San Mauro, Ramacca).

The Greeks from the colonies used this type of kantharoi mainly in funerary ceremonies, and thus the majority of the specimens found in Sicily were actually retrieved from funerary contexts. More than ninety kantharoi are known from the necropolises of Syracuse, where some tombs (Fusco 24, 372; Giardino Spagna 1, 44) provided four or five specimens. Tomb 551 from the Fusco necropolis stands out in terms of the quality and quantity of vases in the burial assemblage, which comprises twenty bucchero kantharoi, and also for the treatment of the body of the deceased, the ashes of which were deposited within a bronze cauldron.

The burial assemblage also attests a few exceptional shapes. Tomb 309 from the Fusco necropolis provided a miniature kyathos of the Rasmussen type 1e, isolated specimens of which have also been found at Lipari and Megara Hyblaea. The necropolises of Gela, Megara Hyblaea and Syracuse provided a few giant kantharoi (Rasmussen type 3d), which in Etruria are attested in the area of Vulci and Caere. The grey fabric and the morphology of one of the two specimens from Gela allows to hypothesize a local production.⁴⁴⁹⁶

Bucchero vases have also been used as offerings in sacred places. They are generally kantharoi, as at Gela, Megara Hyblaea, Syracuse, Selinunte, but in a few cases are also chalices and kyathoi, as in the sanctuary of the Malophoros at Selinunte. Recently, a votive graffito of the sixth century was identified on the wall of a chalice from a votive deposit of the sanctuary of contrada Alaimo at Leontini.⁴⁴⁹⁷ It is a boustrophedon inscription in three lines written in the Euboic alphabet, which was used locally. The choice of a bucchero vase and the status of the person who dedicated it—an *echseleutheros* (it. “liberto”) named *Leukios* (a Greek name that is close to one of the most common Oscan forenames)—could suggest an Italic origin.⁴⁴⁹⁸

Another Greek graffito (*Menonda*, genitive of the Doric name *Menondas*), was noted on a bucchero kantharos from Selinunte, which can be dated no later than the first half of the sixth century.⁴⁴⁹⁹

The predominance of the kantharos among the imports is due to the fact that it was the drinking vase par excellence, and thus complementary to the Etruscan wine amphorae that were produced in southern Etruria from the last quarter of the seventh century, which were also exported to Sicily, probably in a similar circuit of exchange as the bucchero.

The identification of the production centers of transport amphorae in southern Etruria and in the Etruscan areas of Campania is problematic. Some

fabrics have been located in Vulci and Caere. More specifically, Vulci seems to have produced both flat-bottomed (Gras EMA/Py1–2 types) and pointed-bottomed amphorae (Gras EMC/Py 3A–B types) (Fig. 10.2), while Caere seems to have produced amphorae only of the latter type.⁴⁵⁰⁰ These amphorae were generally used for wine, but the possibility of other contents cannot be excluded, as indicated by the olives found within an Etruscan amphora of the Campese shipwreck off the island of Giglio, dated to 590/580.⁴⁵⁰¹

Etruscan amphorae are documented in Sicily between the last quarter of the seventh century and the first half of the sixth century, concurrent with the distribution of the bucchero, and belong mainly to Gras EMA type (Camarina, Himera, Lipari, Megara Hyblaea, Messina, Milazzo, Naxos, Selinunte) and Gras EMC type (Camarina, Himera, Megara Hyblaea, Naxos, Selinunte) (Fig. 85.3a–b). These amphorae are especially diffused in Vulci and its hinterland, and in Campania, where they were imported or produced locally (Pithecusae). Etruscan amphorae are little known, until now, in the Punic centers (Motya, Palermo) and in the indigenous sites of inner Sicily. In the latter case, they are centers either occupied by Greeks, such as Monte S. Mauro, or within the sphere of influence of the colonial areas, such as Colle Madore and Mura Pregne with regard to Himera, and Ramacca with regard to Leontini, a situation that coincides with the distribution of bucchero in the internal areas of the island.⁴⁵⁰²

Fig. 85.3: Types of transport amphorae. a–b. Himera, EMA and EMC types (after Vassallo 1999, fig. 13: 48, 15: 57). c. Lipari, EMD type (after Cavalier 1985, fig. 13: 41). d. Ustica, fractional amphora (after Albanese Procelli 2009, fig. 193)

After the first half of the sixth century, with the end of the export of bucchero, the imports of Etruscan amphorae diminish notably, but do not cease. A few Etruscan amphorae of the Gras EMD/Py 4 type (Fig. 85.3c), which were produced in Southern Etruria and perhaps also in Campania, reached Camarina, Himera, Colle Madore and Lipari in the fifth century.⁴⁵⁰³

A fractional Etruscan amphora from Ustica (height cm 35), close to the EMA group of Michel Gras, was found in the waters off Punta Galéra (Fig. 85.3d).⁴⁵⁰⁴ Similar amphorae, of about 10 liters, are attested in Campania in several contexts, dated to between the beginning and the first half of the sixth century.⁴⁵⁰⁵

The imports of Etruscan transport amphorae in Sicily represent a minor percentage within the circulation of amphorae in the Archaic period. In Messina, for example, in the second half of the sixth and the beginning of the fifth century, the sample of transport amphorae from insula S reveals a predominance of amphorae produced in Magna Graecia and only four Etruscan amphorae.⁴⁵⁰⁶ That the circulation of Etruscan wine was minor in comparison with Greek wine is confirmed by the data from the necropolises of the Greek colonies of the sixth century. Etruscan amphorae, reused for infant depositions, represent about four percent of the total at Camarina, and six percent at Himera. It is not surprising that over thirty Etruscan amphorae⁴⁵⁰⁷ have been found in the latter colony, which is in the orbit of the lower Tyrrhenian sea, a number that exceeds the group identified at Camarina (twenty-five specimens), in which it was possible to discern fabrics produced in southern Etruria and Campania.⁴⁵⁰⁸

The presence of a single Etruscan amphora (Gras EMC/Py 3B type) among twenty-one Greek amphorae attested in the cargo of the shipwreck of Punta Braccetto (Ragusa), of the first half of the sixth century,⁴⁵⁰⁹ might suggest that the traffic was controlled by the Greeks.

4Bronze vases

A progressive growth in the import of bronze vases, which were produced in Greece, in Southern Italy (Magna Graecia) and in Etruria, is also recorded in Sicily in the Archaic period together with isolated products from the north-Italic area. Their distribution, between the eighth and seventh centuries, is concentrated in the Greek colonies, where bronze vases were used in the funerary sphere as cinerary urns, and more rarely as part of the burial assemblage. From the sixth century onwards, these imports began to spread also in the island's internal centers, where they were mainly used as components of the burial assemblage, representing one of the privileged ways of expressing prestige and display on behalf of the acculturated indigenous elite.

Regarding the colonies, the series of bronze lebetes attested in the burials at Syracuse from the end of the eighth/beginning of the seventh centuries to the end of the sixth century, indicates that the embossed rim basins and a few *dinoi*, distinguishable from the Greek ones on the basis of their production technique, were produced in the Etruscan area. The analysis of the contexts is crucial for a better understanding of the provenance areas, such as in the case of tomb Isonzo 4 at Syracuse, where an embossed rim basin was used as a lid for a dinos that shows the typical features of Etruscan production, leading us to suppose a common area of production.⁴⁵¹⁰

Fig. 85.4: Sabucina: Bronze embossed rim basin (drawing by R. M. Albanese)

As far as the distribution of embossed rim basins, which are part of a feasting set of vases destined for the consumption of meat and wine⁴⁵¹¹, Sicily shows a peculiar behavior that is different from that of other Mediterranean regions and also from that of southern Italy, probably due to selective requests from the relevant communities. These differences are also perceivable through the local reuse of this class of vase, as it occurs in Sicily with a specimen of the Pürgen type from tomb Ovest 120 at Sabucina (end of the sixth/first quarter of the fifth cent.), which was transformed into a low tripod through the addition of lead feet (Fig. 85.4). With a few exceptions, the basins retrieved from Sicilian funerary contexts that date to between the end of the eighth/beginning of the seventh and the first half of the fifth centuries have great dimensions. The types with omphalic bottom and a double row of knobs on the rim (Tarquinia type), dated to the end of the seventh/first half of the sixth centuries, and attested on the Italian mainland and in Europe, are absent.

The majority of the forty-two embossed rim basins so far known from Sicily come from Greek colonies (Gela, Megara Hyblaea, Selinunte, Syracuse). In the necropolises of the latter colony they were used throughout theseventh century until the second quarter of the sixth century, a picture that coincides with the period of the greatest attestation of Etruscan imports in eastern Sicily. From the last quarter of the sixth century, distribution is concentrated in the internal centers of central Sicily (Caltagirone, Montagna di Marzo, Monte Chibbò, Mineo, Morgantina, Sabucina, Terravecchia di Cuti).

They were apparently coveted by the indigenous acculturated elite, who celebrated their social prestige in feasting ceremonies inspired by Greek models. At Sabucina, three specimens attested in tombs of the last quarter of the sixth century indicate that they belong to sets of bronze vases of various fabrics. An embossed rim basin, bearing the inscription of the name of an indigenous woman, *Dyspseta*, was used in a tomb from the beginning of the

Fig. 85.5: Caltabellotta: bronze “Rhodian” oinochoe (after Panvini 1986–87, pl. XXX)

In contrast to mainland Italy, the “Rhodian” oinochoai—which were usually produced between the last quarter of the seventh/beginning of the sixth century—are so far documented in Sicily by a single specimen from Caltabellotta (Fig. 85.5), which probably arrived via the nearby colony of Selinunte.⁴⁵¹³ Retrieved from a dwelling from the second half of the sixth century, later than the production date, it can be ascribed to group B of Shefton’s classification, which has been linked to Tarquinia.⁴⁵¹⁴

Vases produced in northern Italy or Europe rarely reached Sicily, and only between the second half of the sixth and beginning of the fifth centuries, through the mediation of the Italian mainland. A situla from Leontini, the only one of its kind found in Sicily, was used as a cinerary urn and probably arrived via the Tyrrhenian area (Fig. 85.6). It can be related to the situlae of the Rhine-Ticino group, which are attributed to *ateliers* located in the area of Golasecca, between Lombardy and Piedmont, in periods IIB–IIIA.⁴⁵¹⁵

The *ciste a cordoni* (Ger. *Rippenzisten*) are also of northern Italian and central-European production. Only two specimens are known in Sicily at Terravecchia di Grammichele and at Civita di Paternò, in the province of Catania (Fig. 85.7). Both feature mobile handles, and belong to B. Stjernquist’s so-called “standard” group, the production of which began after the beginning of the second half of the sixth century.⁴⁵¹⁶

Fig. 85.6: Lentini: bronze situla (drawing by R. M. Albanese)

The complexity of circulation and of the possible intermediates increases in the late Archaic period, when sets of bronze vases and tools for the symposium and the *paideia*—which comprised products of different *ateliers* (Greek, Magna-Graecian and Etruscan)—are deposited in the burial assemblage of tombs of emerging groups in indigenous centres of Sicily.⁴⁵¹⁷

Clear evidence of the modality of circulation of bronze *instrumenta* for the symposium is provided by the retrieval of the handle of an *infundibulum* with a lyre termination datable to the late second half of the sixth century from the shipwreck of Gela I, which sank around 480. The lack of materials from the Tyrrhenian area in this shipwreck, and the presence of a similar *infundibulum* at San Martino in Gattara (Ravenna) in Romagna, suggests that the specimen was acquired through the mediation of the Adriatic area, especially if we take into consideration the ship's route, which, after Greece, probably reached the Ionian coasts of southern Italy and Sicily.

The circulation of similar symposium implements in the hinterland of Gela is documented in the indigenous site of Monte Bubbonia (Caltanissetta) by two specimens, one of which seems to be of local production (Fig. 88.5).⁴⁵¹⁸

Fig. 85.7: Civita di Paternò: Bronze *cista a cordoni* (after Lamagna 2005, 104)

The Etruscan products clearly document an archaeologically “invisible” commerce, which was reciprocated with Sicilian products, such as food-stuffs—cereals, in particular. It is not by chance that Demeter appears among the cults of the sanctuary at Gravisca.⁴⁵¹⁹

Between the second half of the sixth and the beginning of the fifth centuries, new phenomena arise in the cities of the Tyrrhenian area of Sicily, which refer to architectural coroplastics, a sector of artistic production that was destined for public buildings. A series of antefixes at Himera and Lipari is linkable to examples elaborated in the Tyrrhenian area, from Campania to Etruria, and allows us to hypothesize a circulation not only of molds but also of artisans.⁴⁵²⁰

86Sardinia

Abstract: “The island of the silver veins” *Argyróphleps nésos*, is the name by which Sardinia was known in antiquity: the name underlines its richness in ores and metals (silver, copper, iron) and the fertility of its land. Since 1600 BCE it was interested by Nuragic civilization: more than 8.000 nuraghi and 900 giant’s tombs were built in about half a millennium.

As an island in the middle of the Mediterranean Sea, Sardinia was a center of contacts and exchanges: since 16th century many merchants arrived on the island and engaged local people. The general crisis connected with the end of the Bronze Age in the Oriental part of the Mediterranean area created a blackout. By the end of the 12th century BCE new people, from the Levantine coasts, began again to trade with the Greek world: Philistines, Cypriot, North Syrian sailed in the Mediterranean Sea looking for metals, mainly silver.

By mid ninth century BCE the relationships between Levantine and Greek merchants and Sardinia became more and more intense: around 770–750 Sulci was founded by the Tirians and since then began a long phase of colonization. During this period the island played an important role in the Western Mediterranean for its richness and vitality.

The subject of the Villanovan and Etruscan finds in Sardinia needs of an interpretative premise on the different layers of presence as the pioneering studies demonstrate.

The layers are different because they mirror different economic patterns, ways of making trade, organization of local communities. For the Villanovan phase (925–730) the reciprocity of exchanges seems to advantage Sardinia for the quantity of objects found along the Tyrrhenian shores, mostly in the northern part of the island. During the Orientalizing and Archaic phases (730–480) the picture radically changes given the presence of Phoenician colonies which were the responsible of the trade with Etruria.

Taking this in account, some doubts arise on the direct participation of the Etruscans, with their ships coming from coastal cities, to the emporic phenomenon that begun after the mid seventh century BCE.

Keywords: trade, silver, transport amphorae, bucchero, Etrusco-Corinthian pottery

1Introduction

“The island of the silver veins” *Argyróphleps nésos*, is the name by which Sardinia was known in antiquity: the name underlines its richness in ores and metals (silver, copper, iron) and the fertility of its land. Since 1600 it was interested by Nuragic civilization: more than 8.000 nuraghi and 900 giant’s tombs were built in about half a millennium.

As an island in the middle of the Mediterranean Sea, Sardinia was a center of contacts and exchanges: since 16th century many merchants arrived on the island and engaged local people. The general crisis connected with the end of the Bronze Age in the Oriental part of the Mediterranean area created a

blackout. By the end of the 12th century BCE new people, from the Levantine coasts, began again to trade with the Greek world: Philistines, Cypriot, North Syrian sailed in the Mediterranean Sea looking for metals, mainly silver. By mid ninth century BCE the relationships between Levantine and Greek merchants and Sardinia became more and more intense: around 770–750 Sulci was founded by the Tyrians and since then began a long phase of colonization. During this period the island played an important role in the Western Mediterranean for its richness and vitality (Fig. 86.1).

Fig. 86.1: Sardinia. Map of the main sites cited in the text

The subject of the Villanovan and Etruscan finds in Sardinia needs of an interpretative premise on the different layers of presence as the pioneering studies by Fran-cesco Nicosia and Fulvia Lo Schiavo for Iron Age, Giovanni

Ugas, Raimondo Zucca and Carlo Tronchetti demonstrate.

The layers are different because they mirror different economic patterns, ways of making trade, organization of local communities. For the Villanovan phase (925–730) the reciprocity of exchanges seems to advantage Sardinia for the quantity of objects found along the Tyrrhenian shores, mostly in the northern part of the island. During the Orientalizing and Archaic phases (730–480) the picture radically changes given the presence of Phoenician colonies which were the responsible of the trade with Etruria.

Taking this in account, some doubts arise on the direct participation of the Etruscans, with their ships coming from coastal cities, to the emporic phenomenon that begun after the mid seventh century.

2The Iron Age (1000–700)

There are not many signs of Villanovan presence in Sardinia and those that do exist amount to bronze objects: as a recent exposition at Villanovaforru has demonstrated⁴⁵²¹, single pieces or small groupings of items are found scattered in the northern and central part of island. The distribution of finds refers to settlements and sacred areas: they testify the mode of contact with coastal Northern Etruria and redistribution toward the internal districts.

The contexts are referred to settlements and sanctuaries with a wide redistribution in the internal areas showing social complexity by the groups involved. We can thus understand and interpret the discovery of Etruscan bronzes, as well as the Levantine and Greek ones, in the “federal sanctuaries” of Matzanni, in the Sulcis area, of Santa Vittoria at Serri, Santa Cristina at Paulilatino, Su Romanzesu at Bitti, Sa Sedda ‘e sos Carros at Oliena, Sant’Antonio at Siligo, Serra Niedda at Sorso.

The development all over the island of these sanctuaries, which are interpreted as the result of inter cantonal agreements, demonstrates the multiplicity and complexity of these “political” organizations since the Final Bronze Age.

The Etruscan bronze artifacts, as well as for the Levantine ones, represent the ending point of a circulation of “sumptuary goods” among the elites of the Nuragic societies: votive gifts testify the rich and complex relationships between the two Tyrrhenian shores. Levantine or Greek merchants acted as go-betweens but we cannot exclude a direct form of exchange between Villanovans and Nuragic people.

It seems not fortuitous that a critical change has happened during the second half of the ninth century when the Oriental marines had strong relations with some areas of Western Sardinia, the Southern Nurra (Alghero), the Gulf of Oristano, the Sulcis area. By now they begun a trade network which encompasses at different levels all the Mediterranean area with a strong

presence of the Levantine (Tyrian) and Greek (Euboic and Athenians) marines.

In this part of the Mediterranean area the organization of trade depended on its dimension: pan Mediterranean, inter regional, regional or internal. These levels were interconnected, as Susan and Andrew Sherrat have presented in an important contribution, or more recently as Maria Eugenia Aubet proposed for the relationships between the Near East and the western Mediterranean⁴⁵²².

For the pan Mediterranean level the Levantine marines, Tyre *in primis*, have had a guiding role since the ninth century. In this organization the role of Sardinia is central, for its geographic position and for the strength of local communities, in the Sulcis district, in the Northern part of the Gulf of Oristano and in Alghero area. Here the site of Sant’Imbenia seems to have had a leading and central role in a “political” organization of a wider territory: in a first phase the interlocutors are coming exclusively from the Levantine area and Greece. Since the mid eighth century BCE they change, being predominant the relations with western Mediterranean colonies (Sulki, Carthage, Gadir and Southern Spain, Pithekoussai and Cumae), as the direct heirs of trade and commerce of the first phase. At the same time, the diffusion of Sardinian vessels in the Western and Central Mediterranean area can be explained in the light of long distance and interregional trade.

3Orientalizing and archaic periods (730–500)

The organization of Phoenician colonies developed by Tyre in the Western Mediterranean area, has had in Sardinia its main settlement in Sulki. This site was part of the long distance network and then assumed a leading role in the creation of inter regional and regional circuits. On the other shore of the Tyrrhenian Sea, after a first phase of Euboic presence, since the end of the eighth century BCE the overwhelming Corinthian penetration, with its colonies in Sicily and Southern Italy, radically changed the trade relations between Phoenicians and Greeks. Following S. and A. Sherrat, for the interregional trade the role played by the carriers was not very important, nor the participation of a center to a circuit cannot be connected exclusively to a Phoenician or East Greek vector⁴⁵²³.

At a regional level the organization displayed by colonies was really important in relation with the role played by local communities. In all the areas interested by Phoenician colonies the “foreigners” were received and integrated in the local political system which gave the goods for the regional and interregional trade.

In this phase the Corinthian trade can be compared with the Phoenician one which was older, more structured and dedicated to the *emporìa*. Michel Gras thought that the emporic trade has cancelled the “Etruscan, Ionic, Corinthian

or Laconic trade” in order to create new streams and circuits in which many centers, local and colonial, participate⁴⁵²⁴. This implies the end of an exclusive relation between the merchant and buyers as it was in the preceding phase of the “gift-trade”.

Looking at the diffusions and distribution of amphorae and of fine wares, which constitute the accompany goods to the commercial transactions, we can try to reconstruct these trade streams in Central and Western Mediterranean area (Tyrrhenian, Carthaginian, Iberic, and Southern France).

In this framework the presence of Etruscan vessels in Sardinia covered a phase from the mid seventh to the end of the sixth century. This coincides with a mature organization of the Etruscan cities states that has been played an important role in the emporia. Since the Middle Orientalizing period bucchero and Etrusco-Corinthian pottery, produced in Southern Etruria, have been found in Sardinia. During this phase (650–30/500–470) the vessels arrived in Sardinia are connected with the consumption of wine (to pour, amphorae, oinochoai and olpai; to drink, cups, chalices, kyathoi, kantharoi and skyphoi) with some exceptions for shapes for eating (Etrusco-Corinthian plates) and seldom for oil (standardized productions of aryballoi and alabastra in Etrusco-Corinthian ware). The Etruscan transport amphorae are very few (less than ten), attested in urban contexts or from the sea.

In this picture, dominated by the small shapes for consumption of wine, both in bucchero and Etrusco-Corinthian pottery, the Phoenician colonies of southern and central Sardinia had an almost exclusive role in the importation. These vessels are attested both in the colonies and in the internal districts, in Sardinian settlements.

Very few finds from colonial centers are researched and edited on these phases (Sulcis, Monte Sirai, Nora, Bitia), even less are the Sardinian sites in which this phase can be recognized. We expect quick transformations, as it emerges from the PhD dissertation by Stefano Santocchini Gerg in comparison with the pioneering researches by G. Ugas and R. Zucca, or the *Trafics tyrrhéniens archaïques* by M. Gras, the *I Sardi* by C. Tronchetti and many papers by F. Nicosia and Paolo Bernardini⁴⁵²⁵.

Today the quantity and quality of finds coming from settlement contexts is huge with a wide morphological attestation in comparison with the old discoveries carried out in necropoleis.

In his recent work, S. Santocchini Gerg demonstrates that more than 50% of the Etruscan pottery found in Sardinia comes from settlements, while most of vases which comes from necropoleis was discovered between 1850 and 1950.

New contexts excavated in urban areas, together with the increasing knowledge on the pottery productions, both for the bucchero and the Etrusco-Corinthian ware, have sensibly modified the interpretation: recent discoveries demonstrate that in urban contexts pottery can be found from Caere, Tarquinia and Vulci as the Etrusco-Corinthian fabrics show.

The Etruscan importations in Sardinia between 630 and 500 are part of those “secondary composite burdens” assembled in the Etruscan cities and participating to the emporic model as well interpreted by M. Gras. In the emporic model the provenance of the carrier has a minor importance, using the ship to transport, sell and buy goods in all the cities along the circuit. It will be not surprising if, in the phase of maximum presence of Etruscan pottery in Sardinia, the carriers between the two shores of the Tyrrhenian Sea could be both Phoenicians and Greeks, mainly Ionian *naukleroi*.

The Greek phase of Olbia (630–500), according to Rubens D’Oriano on the basis of the exclusive presence of Corinthian and Ionian pottery in the colony, is part of this story: the total absence of Etruscan pottery from the excavations carried out under the modern city are not an obstacle to the direct participation, with a leading role, of Olbia in a Sardo-Tyrrhenian circuit.

The presence of Etruscan pottery in Sardinia is for the majority attested in the Phoenician colonies, from Sarcapòs to Tharros. The framework is incomplete because data are missing from some important sites: Karales (Cagliari) is the main one.

Karales was part of the Sardinian circuit playing a leading role in Southern Sardinia: it can be inferred by the rich presence of Etruscan importations in the Golfo degli Angeli (at Cuccureddu di Villasimius), Nora and Bitia.

At Nora, recent excavations in the Roman Forum and on the Eastern Sanctuary areas have brought into light a rich and articulated picture of Greek and Etruscan importations during this phase. The publication of the old excavation in the Bitia necropoli, the excavations carried out in the Cronicario at Sulcis, at Monte Sirai and Nuraghe Sirai, the surveys and excavations in the *emporikos kolpos* (the Gulf of Oristano) at Tharros, Othoca and Neapolis have returned Etruscan wares which shed a new light on the nature of the Etruscan presence.

The redistribution of Etruscan pottery reaches the internal districts of Sardinia: if at Nora and Bitia this phenomenon is virtually absent, in other districts it seems very active and testify intense relations between coastal centers (usually Phoenician colonies) and the hinterland controlled by local communities.

In the Sulcis district the irradiation of Etruscan pottery suggests a Phoenician interest for the territory organized with the “foundation” of satellites (Pani Loriga), the occupation and “re-foundation” of old Nuragic settlements (Monte Sirai) or the participation in a Sardinian settlement which maintained its urban planning (Nuraghe Sirai). In this framework of Phoenician presence, in which Sulcis had a leading role, the presence of Etruscan pottery is uniformly distributed both in settlements and necropoleis. We cannot know if the imported pottery was property of the colonists or, possibly, to the local elite to perform ceremonies of drinking. The bucchero and Etrusco-Corinthian cups, the amphorae, oinochoai olpai and jugs could be seen as *exotica* to local communities which have accepted and integrate, in the

areas under their control, the Oriental “foreigners”.

The structured form of collaboration between the Sardinian people and the Phoenicians in the Sulcis district is an anomaly. Such a collaboration could be performed also in the territory around Tharros and the relation with S’Uraki (San Vero Milis), Su Monte (Sorradile), possibly S’Archittu (Cornus). In other Sardinian districts the phenomenon is evident and we observe the penetration of Etruscan pottery in local, Sardinian, areas. Some old “Nuragic” villages and sanctuaries in the Campidano of Ca-gliari have attested some bucchero or Etrusco-Corinthian pottery, rarely some bronze artifacts (Settimo San Pietro; San Sperate, Monte Olladiri, Monastir; M. Leonaxi, Nuraminis; Santu Brai e Dom’e s’Abis, Furtei; Nuraghe Piscu, Suelli; Tuppediti, Villanovafranca; Santa Vittoria di Serri, Santa Anastasia, Sardara).

These sites share the basin of the Riu Mannu-Samassi: from its mouth, near Nea-polis, it stretches some 50 km into the hinterland. This organization, as at Sulcis and Tharros, suggests, even if with very few data, the extraordinary vitality of the internal local villages and their relations with the coastal colonial sites. This leads us to believe that the Campidano di Cagliari, the Sulcis area and the Gulf of Oristano were not *agri deserti* during the seventh and sixth centuries just taking in account only the Etruscan and not the Phoenician or the Greek pottery.

Other Sardinian districts, which did not see Phoenician colonial settlements, were involved in these circuits: the basin of the Temo river (Pozzomaggiore; Santu Antine, Torralba; Monte Zuighe, Ittireddu) could be referred to a site at the mouth of the river where today lays Bosa; the Nurra, in the Alghero area, (Nuraghe Flumenelongu, Alghero; Camposanto at Olmedo; Nuraghe Su Igante, Uri; and, perhaps, Predda Niedda, Sorso) to the Nuragic village of Sant’Imbenia. The northern coastal area in the Coghinas valley (Perfugas) has a possible reference to the mouth of the river; the Nuraghe Albucciu (with a dubitative bronze situla) to the Greek Olbia; the pottery sherds from Posada, from the Grotta Duas Vaccas (Siniscola), the presences in the Nuoro area lay along the basin of the Posada River.

From the presence of Etruscan pottery all over Sardinia we know that the local communities are socially and economically vital. In Northern Sardinia, where the colonial phenomenon is absent, the uninterrupted relations between local political structures and merchants can be interpreted as an interest of Phoenician and the Greek marine for the trade in this part of the island.

From a local point of view there were many “peer polities” which have managed the exchange and participate to the commercial circuits moving their surplus all over the Western Mediterranean area. These “peer polities”, articulated in a urban or in ethnic organization, present a well segmented society, have the control of their territories, can construct solid relations with merchants.

The vases or bronzes found in sanctuaries all over the island testify the ending chapter of a story begun with gift-trade, continued with the circulation

of object in local polities, ended with a votive offering by local élites in a sanctuary.

Pottery and metal objects witness the vivacity of local polities which is not limited to the coastal areas but penetrate in the internal districts inhabited by Sardinian communities. These are phenomena of *long durée* which began during the Early Iron Age and continued until the end of the sixth century, when Carthage tried to impose its dominion on a third of the island.

Alessandro Naso

87Greece, Aegean islands and Levant

Abstract: From the ninth to the fifth centuries BCE, Etruscan items, such as weapons and luxury goods, are among the inventory found in Greek sanctuaries and reflect relations between Italy and Greece. Because most of these votive offerings (Gk. *anathēmata*) are not inscribed, it must be presumed that they were dedicated both by Greeks returning home and by Etruscans who were admitted to Greek sanctuaries. This possibility is raised by the two buildings, or treasuries (Gk. *thesauroi*), that like several Greek cities, the Etruscan cities of Caere and Spina maintained in the sanctuary of Apollo at Delphi to hold the offerings to the gods. This privilege of the inhabitants of Caere and Spina is remarkable, because they were the only non-Greeks to have their own treasuries in the Delphic sanctuary. Bucchero, the Etruscan national pottery, was also appreciated by the Greeks, who adopted in their wine culture the shape of the most common Etruscan drinking cup, the *kantharos*. A few Etruscan finds reached the Levant as well. After the fifth century, there are no Etruscan finds in Greek contexts outside Italy.

Keywords: Etruscan, Greek, sanctuary, panhellenic, votive offering

Introduction

In contrast to the thousands of Greek artifacts found in Etruria, only a little over 400 Etruscan and Italic objects (about 270 of bronze, and 150 of clay and other materials) have been found in the ancient Greek world—which includes modern-day Greece, the Aegean islands, and Turkey, but excludes Sicily (see [chapter 85](#) Albanese Procelli) and North Africa (see [chapter 88](#) Naso), the Levant, and the Black Sea area ([Fig. 87.1](#)). Most were dedicated to the gods as votive offerings (Gk. *anathēmata*) in sanctuaries, both by Greeks returning home and by Etruscans, who were admitted to Greek sanctuaries even though they were foreigners. The finds date from the ninth to the fifth centuries BCE, but no later. The richest findspot is the sanctuary of Zeus at Olympia, where more than 120 Italic objects have been found. With very few exceptions—such as the three helmets from Olympia celebrating the victory of Hieron of Syracuse over the Etruscans in the sea battle of Cumae in Campania in 474 ([Fig. 87.2](#))⁴⁵²⁶—the offerings are not inscribed, so one can only speculate about the occasion of their dedication and the identity of the dedicator. In many cases general historical knowledge is too limited to allow precise hypotheses, and the objects can only be classified from an archaeological point of view. It is possible, however, to group finds with similar characteristics to try to connect them with historical events.

1Late Bronze Age

Pottery and bronzes of Italic origin dating to the Late Bronze Age (twelfth–tenth centuries) found in Greece, especially on Crete, and conversely, Mycenaean pottery from Italy, demonstrate the existence of relationships between the two areas based on trade and the exchange of technology. The distribution and typology of the Italic objects in Greece suggest the existence of a large movement of specialized craftsmen, including metalworkers, from Italy to the Aegean at the end of the Bronze Age.⁴⁵²⁷ Nothing has yet been found dating to the period from the Bronze Age to the Early Iron Age (the tenth and ninth centuries), but this does not necessarily reflect a real interruption in the well-established relations between the eastern and western Mediterranean and is due to accidents of discovery.

2Iron Age and Orientalizing period

Italic bronze weapons, which have mostly been found in the Panhellenic sanctuaries of Zeus at Olympia and Apollo at Delphi (but in other shrines as well), comprise a precise group in Greek sanctuaries. Offensive arms include

bronze spearheads, some axes, and one sword (from Samos). Among defensive weapons, shields predominate, but two helmets have also been found. The arms are not preserved intact but seem to have been intentionally cut up and rendered unusable before being dedicated. This was a typical Greek practice, which allows us to bypass the controversy over the interpretation of these materials in favor of the hypothesis that in general, Italic arms found in Greek sanctuaries represent weapons captured in battle by the Greeks in Italy and dedicated—in both Panhellenic and local sanctuaries—by Greeks who had returned home. We know that Greek settlers in Italy fought against indigenous peoples in various places, as Thucydides reports in Sicily for Syracuse and Leontinoi (Thuc. 6.3.2–3). On the other hand, archaeological evidence from Cumae in Campania and Epizephyrian Locris on the Ionian Sea in Calabria shows that earlier indigenous settlements were abandoned just after the Greek foundations, so that at least some battles may be assumed.

According to present knowledge, the typological characteristics of the Italic bronze spearheads from Olympia and Delphi fit with those of the spearheads used in both Calabria and Sicily.⁴⁵²⁸ Therefore, we can assume that they were dedicated by returning Greeks, to thank Zeus Olympios not only for his advice in the choice of the site for the new foundation, but also for his assistance in travel and fighting the enemy. This may also explain the distribution of spearheads in major and minor sanctuaries. In Olympia, the colonists (Gk. *apoikioi*) received help before leaving for Italy by consulting oracles, whom they then had to thank upon returning home. On the other hand, the local sanctuaries may have been at the birthplace of some colonists. This assumption is generally valid, but we can distinguish some exceptions.

A bronze spearhead from Olympia, more than 60 cm long and exceptionally decorated with fine engraved triangles and dots, has very few comparable pieces in Italy—and they are from Etruria. Its dimensions and decoration indicate that it was not only a weapon, but also a symbol of power, as spears often were in early societies.⁴⁵²⁹ If this is true, the most likely owner—and therefore the possible dedicator in Olympia—could have been an Etruscan, who, thanks to early Hellenization, knew the importance of the sanctuary of Zeus and wanted to behave like a Greek. As a result, he might have devoted to the Greek god his own symbol of power.

This is a possibility stated by Pausanias, who in the second century CE saw in Olympia “a throne donated by the Etruscan king Arimnestos, the first barbarian to honor Zeus with a votive offering” (Paus. 5.12.5). Unfortunately, Pausanias does not describe the throne or give us any indication of the date of the votive offering. Some finds and general knowledge help us to suggest a chronology. First, the bronze finds at Olympia also include two fragments of repoussé sheets belonging to at least one Etruscan throne, dating to the first half of the seventh century.⁴⁵³⁰ Second, *Arimnestos* is the Greek rendition of an Etruscan family name that sounds very similar to the Latin name of the

Ariminus River (modern-day Marecchia) in Romagna near the Adriatic, where the Romans founded the colony of Ariminum in 268 BCE. It is likely that the river name has Etruscan origins, because in that territory Etruscans had been settled around modern-day Verucchio since the early Iron Age (see [chapter 76](#) von Eles). The most flourishing period for the Etruscans in Verucchio was the eighth–seventh centuries; the tombs dating to this period have yielded some exceptional textiles (see [chapter 29](#) Gleba) and at least eleven engraved wooden thrones, the highest number known from any Etruscan cemetery. So it seems likely that in the seventh century a throne was donated to Zeus at Olympia by an Etruscan king from Verucchio whose name was **Arimneste* according to Carlo de Simone or **Ariemena* according to Giovanni Colonna.⁴⁵³¹ The throne was perhaps made of wood: on the one hand the lack of information in Pausanias, who normally describes the precious material (bronze, marble) of the most valuable votive offerings, and the archaeological evidence of thrones in Verucchio on the other, make the hypothesis regarding the material very likely.

Some bronze fibulae with amber panels that came to light in the sanctuary of Artemis at Ephesus, where they were probably dedicated together with textiles or cloth suggest a possible role of the Etruscan community of Verucchio in trade relations in the eastern Mediterranean. The shapes of these fibulae are completely isolated among the finds from Ionia, so overseas origins can be presumed for the fibulae from Ephesus, where further amber finds are known. According to present knowledge, raw amber may have been imported from Verucchio to Ephesus to be worked in a local style.⁴⁵³² Fibulae with amber panels may have been involved in the raw amber trade; if this is true, they become the indicator for relationships that otherwise would be completely unknown for us.

The trade link between Verucchio and Ephesus, which can be connected to the highly specialized amber-working craft that had developed at Verucchio, is not a unique case, because other examples of probable direct relationships between cities in the western and eastern Mediterranean can be identified, which reveal further trade connections. Bronze workshops flourished at Vetulonia in the first half of the seventh century. Their broad production encompassed not only vessels, but also other objects, such as characteristic larger and smaller belt clasps that accompanied, respectively, male and female outfits. Characteristic bronze items from Vetulonia have been found in the sanctuary of Hera at Samos, such as a small belt clasp and the remains of a handle decorated with lion heads and a flower from the top of a censer.⁴⁵³³ Correspondingly, Vetulonia has yielded typical Samian finds, dated to the first half of the seventh century (bronze cauldrons decorated with griffin or lion protomes⁴⁵³⁴) and to the second half of the seventh and the early sixth centuries (many clay vases).⁴⁵³⁵

How can we explain the existence of luxury object exchange between Vetulonia and Samos? A possible answer may be Etruria's metal resources.

The copper and iron minerals in northern Etruria were already being exploited in the seventh century, and the Vetulonia's elite were involved in the mining industry (see chapter 25 Zifferero). Trade in ingots or partly worked metals between Etruria and Samos or other eastern Greek communities can only be assumed as early as the first half of the seventh century; the wreck found off Giglio Island proves that around 600 BCE, metal ingots played a primary role in Mediterranean trade relations (see chapter 49 Nijboer) and implies personal relationships between the merchants, as shown by the Etruscan *tesserae hospitales* in the sixth and fifth centuries (see chapter 10 D'Ercole). All this allows us to imagine that gift exchange to establish new trade partnerships was probably going on in the early seventh century. The luxury objects from Vetulonia and Samos may well be the fruit of a gift exchange, which in Etruria is well attested in inscriptions.⁴⁵³⁶

In Olympia, women's jewelry also came to light, some of which is concentrated around the temple of Hera. Because the pieces were found during several campaigns carried out over many years—even before the Hera temple itself was found⁴⁵³⁷ —they have not yet been completely identified. They are from no later than 600 BCE, and include two joining fragments of a silver Etruscan plaque, probably from a diadem of the first half of the seventh century. The plaque shows a variety of stamped decoration, including animals like winged lions, depicted walking and crouching, motifs, such as a cable pattern, Phoenician palmettes, and concentric-circle ornaments (Fig.87.3). Because early stamped jewelry is characteristic of southern Etruria in both Tarquinia and Caere, it is likely that the votive offering comes from this district.⁴⁵³⁸

3Archaic and Late Archaic periods

From the early sixth to the mid fifth centuries, Etruscan pottery, such as bucchero, together with luxury goods such as bronzes and wooden shrines with ivory plaques, all played an active role in the framework of Archaic trade in both the western and eastern Mediterranean.

Bucchero, the national Etruscan pottery (see chapters 46 Micozzi and 52 Bentz), is widespread throughout the Mediterranean from Spain to Turkey and from southern France to North Africa, particularly in the form of the *kantharos*, a drinking cup with two high handles that allow the vessel to be handled easily (Fig. 49.2). Bucchero *kantharoi*—particularly the shape classified as 3e by Tom Rasmussen and used from the end of the seventh century to the first half of the sixth—are the real marker of the Etruscans all over the Mediterranean.⁴⁵³⁹

Etruscan *kantharoi* were highly appreciated in Greece. Herman Brijder notes that the low attachment of the handles on the body shows that the earliest Attic black-figure *kantharoi* around 580 derive directly from Etruscan bronze *kantharoi*.⁴⁵⁴⁰ The bronze handle of an Etruscan *kantharos* found in the temple of Apollo at Didyma proves that bronze *kantharoi* were also offered in Greek sanctuaries; later black-figure vase paintings, dating to the second half of the sixth century, show that the shape was adopted in Greek culture as an attribute of Dionysus, the Greek god of wine. Miletus is the richest bucchero findspot in the Aegean; the recent German excavations have produced more than 100 Etruscan bucchero sherds, mostly from *kantharoi*. Thin section and petrographic analysis allow us to identify the probable Etruscan production centers of the bucchero vases, which were dedicated in the local Aphrodite sanctuary. These centers were Caere and Tarquinia, which probably had direct relationships with Miletus.⁴⁵⁴¹ Greek votive inscriptions on bucchero *kantharoi* from Perachora in Greece, Ialysos on Rhodes, and some findspots in Sicily demonstrate that such votive offerings in Greek sanctuaries must be connected to Greeks (Fig. 87.4.1–4).⁴⁵⁴²

Fig. 87.5: Etruscan Inscriptions from Greece: 1. Laconian cup from Aegina; 2: gem from Perachora (after Cristofani 1993, fig. 1)

Several votive offerings are surely Etruscan *anathemata*. Two inscriptions

from Aegina and Perachora suggest that the Etruscans wanted to act like Greeks and participated in the life of the sanctuaries. The first Etruscan inscription in Greece has been identified in the sanctuary of Aphaia at Aegina; unfortunately it is incomplete: *mi pl [...]*x *inur*. The text, engraved on a stemless Laconian cup from the third quarter of the sixth century, names the cup's donor in the first person. After *mi* ("I") can be read *pl*, probably the beginning of the family name of the person making the dedication. For the restoration of the missing part there are several possibilities, but none of them is certain. The final letters]x *inur* indicate a plural, which may refer to an offering of more than one object (Fig. 87.5.1). Mauro Cristofani suggested connecting the inscription with the rituals carried out in the dining rooms of the sanctuary of Aphaia and assumed the presence of an Etruscan at these ceremonies. Recently, a second Etruscan inscription from Greece has been read on a Greek gem from the sanctuary of Hera at Perachora, probably datable around 500. (Fig. 87.5.2)⁴⁵⁴³

The most famous Etruscan *anathemata* in Greek sanctuaries belonging to 6th–5th cent. are concentrated in Delphi and are connected to the consultation of the oracle there.⁴⁵⁴⁴ An inscribed stone base recording a Greek dedication to Apollo by the Etruscans belongs to the early fifth century. According to the traces remaining on the top, the base probably held a *lebes* or a krater of bronze on a supporting column. The Greek text from Delphi raises some questions—primarily the mention of the Etruscans as a people, because it would be the only direct testimony of the Etruscan nation thought of as a whole (see [chapter 35](#) Cerchiai). The inscription is not complete, so doubts remain. We know from literacy sources that in the fifth century, two Etruscan cities—Caere and Spina—built their own treasuries in Delphi, as was the usual practice for several Greek city-states.⁴⁵⁴⁵ The purpose of a treasury is to commemorate victories and to thank the oracle of Apollo for her advice, which was thought to have contributed to the victories. The buildings are called treasuries (Gk. *thesauroi*), because they held the offerings made to the god of the sanctuary; these were frequently a tenth of the spoils of a battle. The only non-Greek cities with their own treasuries in Delphi were the Etruscan cities Caere and Spina. It is not by chance that these two cities are represented there; even though they were Etruscan, both were thought to have Pelasgic, i.e. Greek, origins.⁴⁵⁴⁶ They represented the Tyrrhenian and the Adriatic coasts and the corresponding resources from each—the metals of Tuscany and the grain of the Po plain, both of them essential to the Greek economy. It can therefore be suggested that all this played a role in the permission and/or invitation for the two non-Greek *poleis* to build their own treasuries at Delphi, both in the fifth century. The identification of the Etruscan buildings within the sanctuary is uncertain. G. Colonna suggested identifying the *thesauros* of Caere with the remains of a building at Marmaria in the sanctuary of Athena near the treasury of Massalia (the Greek city corresponding to modern-day Marseille in France) and to date it to the second

half of the sixth century; epigraphic texts are lacking.⁴⁵⁴⁷ Regarding the treasury of Spina, two characteristic bronze leg caps belonging to a wooden Etruscan folding chair were found in Delphi and compare well with similar finds from Etruria Padana of the first half of the fifth century. The side palmette on the top of the leg caps is a characteristic of the folding chairs from Etruria Padana, whereas the leg caps of the folding chairs from southern Etruria end with an ivy leaf. In Etruria such chairs were probably a symbol of a magistrate and as such were transmitted by the Etruscans to Roman culture (*sella curulis*). If this is true, the chair from Delphi may have been offered on an unknown occasion in the *thesauros* of Spina by a magistrate from Etruria Padana. Actually the two bronze fragments are the only remains that may be connected to the *thesauros* of Spina (Fig. 87.6).⁴⁵⁴⁸

The great skills of Etruscan bronze workers were highly appreciated in Greece, as the literary tradition of the Late Archaic shows and several finds confirm, including incense-burners, a tripod, and *infundibula*.⁴⁵⁴⁹ *Infundibula* are utensils of genuine Etruscan invention, which were used as both funnel and strainer to filter wine (see chapter 88 Naso). They were imported to Greece from Etruria and were probably also imitated by Greek utensil-makers. Special attention is due to an *infundibulum* from Olympia that is part of a wine set, which includes three other Greek bronze vessels (a cauldron, a fragment of a basin, and an *oinochoe*), all four of which were inscribed in the late sixth century with the same dedication to Zeus Olympios by the Eleans, inhabitants of Elis/Eleia, an ancient district of the Peloponnese.⁴⁵⁵⁰ We know neither how the Etruscan *infundibulum* came to Olympia nor the occasion for its offering along with the other bronzes. What we know is that it was part of a Greek wine set that was used in ceremonies in the sanctuary of Zeus.

Fig. 87.6: Delphi: Etruscan bronze revetments from a folding chair (photo A. Naso)

Some specific Etruscan products delighted Greek customers. According to the Athenian comic poet Cratinus, Etruscan bronze sandals with thick soles were known and appreciated in fifth-century Athens. The mention of the sole connects this remark to a specific model of sandal, which in Etruria was a woman's platform shoe. The sole was thick enough to bear a bronze sheet with embossed figural decoration, as can be seen on an earlier pair of Etruscan sandals from Grave 119 of the cemetery of Campovalano in Abruzzo (Teramo province), which dates to the early sixth century.⁴⁵⁵¹ Etruscan bronze vases were also appreciated in the Levant. In Hauran, in southern Syria, at Tell Sukas and Al-Mina on the coast of northern Syria respectively, have been found one *olpe*, one foot from a *cista* (small casket) and an *oinochoe*, dating to different decades of the fifth century.⁴⁵⁵²

These bronzes, and some wooden Etruscan shrines with ivory plaques from the first quarter of the fifth century have been found in several places in Greece, including Athens,⁴⁵⁵³ and show the broad—if quantitatively limited—diffusion of Etruscan handicraft items in the Greek world. Together, they can be interpreted as traces of a trade based on Athenian figured vases, which was in Greek hands, and as the alphabetic trademarks show.⁴⁵⁵⁴ However, involvement of Etruscans in the vase trade is possible. Greek potters and painters, such as the Athenian potter Nikosthenes, whose amphorae were

produced expressly for Etruria,⁴⁵⁵⁵ were so willing to adapt their production to Etruscan tastes that the presence of Greek agents in Etruria and Etruscan agents in Athens can be assumed. It has recently been suggested that an Etruscan painter could have been active in the workshop of Nikosthenes in Athens around 520.⁴⁵⁵⁶ The importance of Etruscan business for the Greek vase traders is evidenced in the fifth century too. A mid fifth-century red-figure cup sherd from Populonia, attributed by John Beazley to the workshop of the Penthesilea Painter, bears a painted Etruscan inscription: *metru menece*, “Metru made (me).” The Etruscan personal name Metru derives from the Greek Metron. A variety of interpretations of this sherd have been offered, but is likely that Metru/Metron was an Athenian potter, who by translating his name stressed the destination of the vase in Etruria.⁴⁵⁵⁷

4Epilogue

A number of items, from the throne of Arimnestos in Olympia, to the magistrate's folding chair in Delphi, establish that the Etruscan elite in Tyrrhenian and Adriatic city-states—which had a favored position within the Greek world—participated in the life and ceremonies of Greek sanctuaries, consulting oracles and giving votive offerings. Etruscans probably played a role in the production and distribution of Athenian pottery in Etruria in the sixth and fifth centuries. The presumed presence of Etruscans in Greek cities was a limited phenomenon, chronologically restricted to the age of more intense relations between Greece and Etruria, the sixth and fifth centuries. Athenian vases dating to the fourth century were exported to Adriatic Italy, particularly Spina, but the general historical frame is completely new.

88North Africa

Abstract: North Africa has yielded Etruscan and Italic finds dating to the seventh and sixth centuries BCE, which are particularly concentrated in Carthage. Carthaginians and Etruscans were both *barbaroi* and natural allies against the Greeks, as the literary tradition confirms. The quantity and the nature of the pottery and bronzes found here show that the Punic city had direct and intense trade relationships with Etruscan partners such as Caere. Etruscan artifacts have also been found in Greek colonies such as Cyrene and Naucratis, probably brought along the complex trade routes connecting the western and eastern Mediterranean in the Archaic period. Good relations between Carthaginians and Etruscans continued for many centuries, since in Tunisia and Algeria there are isolated finds until the second and first centuries, including inscriptions revealing the presence of Etruscans, who probably escaped from their homeland when it was conquered by Roman armies.

Keywords: Trade, personal relationship, Carthage, Cyrene, Tunisia

Introduction

Etruscan finds in North Africa are concentrated particularly in Carthage, as has been noted by several scholars, but Etruscan objects have also been found in other places, such as the Greek colonies of Cyrene and Naucratis.⁴⁵⁵⁸ For a general and reliable overview, then, it is necessary to extend the field of research to all of North Africa and to compare the large amount of data from the Punic city *par excellence* with finds from elsewhere. After a very few finds that date to the Early Iron Age, two main phases can be distinguished. The first corresponds to the Late Orientalizing to Archaic period, and the second to the Late Archaic to Hellenistic period (Fig. 88.1).

1The Iron Age

In the early 1870s, the Marquess of Courtance bought a bronze *antenna* sword in Egypt and gave it as a gift to the king of Italy for the Armeria Reale of Turin, where it is still preserved (Fig. 88.2). There is no record of the sword's original provenance,⁴⁵⁵⁹ but the type is widely distributed in Italy and Central Europe in ninth- and eighth-century BCE contexts. Raffaele Carlo de Marinis has recently discussed the various typologies that have been developed for these swords. The exemplar in Turin belongs to the oldest type, known as the

Tarquiniia-Vetulonia type, and dates to the ninth century.⁴⁵⁶⁰ This chronology makes it highly improbable that this Italic sword, a ceremonial weapon, could have come from North Africa, but of course the question is still open to debate.

Fig. 88.1: North Africa. Map of the sites cited in the text

Trade relationships between North Africa and the Italic regions are, however, evidenced by three pottery sherds found in disturbed layers in Carthage. They belong to a particular shape of Sardinian jug, the *brocche askoidi*. Outside Sardinia, where they were popular from the Late Bronze to the Early Iron Age, jugs of this shape are known in Etruria (especially in Vetulonia, but also in Vulci, Tarquinii, and Caere), Sicily (Mozia and Dessucri), Crete (Khaniale Tekke), and Spain (Huelva, Carambolo, and Cadiz).⁴⁵⁶¹ Perhaps they were used for a specific commodity, which may explain their wide distribution. Iron Age Pottery from central Italy has been found at Utica both in the french-tunisian and spanish excavations⁴⁵⁶².

Fig. 88.2: Bronze antenna sword (after Bianco Peroni 1970, pl. 45, no. 305)

2Late Orientalizing and Archaic periods

From the second half of the seventh century, the founding of Greek colonies

such as Cyrene (with its subcolonies including Taucheira—modern Tocra—and Apollonia) and Euhesperides in western North Africa, and Naucratis, in Egypt, brought not only Greek colonists but also new connections and new waves of trade. At that time, Carthage had not yet begun its expansion into western North Africa, but had already established trade relations with the Etruscans, as the many finds indicate, and probably also with the Italic populations in Sicily, as reported by ancient authors. In its tombs, both old and new excavations have found more than sixty bucchero vases dating from the third quarter of the seventh century onward.⁴⁵⁶³ Among these early finds, an *oinochoe* in thin bucchero (It. *bucchero sottile*) is particularly notable. The form is quite typical for Caere and its district, and dates to just after 650. Twenty-eight small amphorae and twelve *oinochoai* or jugs, found in many graves and probably connected to wine consumption, also indicate contact with southern Etruria in the second half of the seventh century. In Carthage, there are also bucchero drinking cups: 2 *kotylai*, 11 *kylikes*, and 11 *kantharoi* (Fig. 88.3). The bucchero *kantharos* is the number one sign all over the Mediterranean of Etruscan presence, from Spain to Turkey, and from southern France to North Africa, particularly Tom Rasmussen's type 3e, which was used from the end of the seventh to the first half of the sixth century. To the distribution map of this shape compiled by Friedrich-Wilhelm von Hase can be added further finds from the Aegean Sea (see chapter 87 Naso and Fig. 49.2).

This map can include Taucheira in Libya and Naucratis in Egypt as well. At Naucratis, at least two *kantharos* sherds have been found, belonging to type Rasmussen 3e.⁴⁵⁶⁴ The first sherd is relevant because—according to its publisher Erika Prins de Jong—some traces of silvering are still preserved on it⁴⁵⁶⁵. “Silvering” refers to a particular treatment of the surface, which may have been achieved in two different ways. The first method, which is older, quite rare, and more expensive, applies a thin layer of metal (silver or gold) to the pottery using a particular type of clay (bole, It. *bolo*) as an adhesive. According to Klaus Burkhardt, the second method was cheaper and more frequent, and involved burnishing the surface before and during firing the pot to achieve a silver appearance.⁴⁵⁶⁶ Because both methods were exclusive to workshops in Caere, we can assume provenance from that city for the bucchero *kantharos* found at Naucratis. The presence in Naucratis of bucchero with silver decoration is all the more significant, since throughout the Mediterranean only one other sherd with such decoration is known, from the Heraion in Samos. According to Bernard Bouloumié, some bucchero *kantharoi* with silver decoration were probably found in the La Love wreck off Cap d'Antibes; but it is impossible to verify this.⁴⁵⁶⁷

Fig. 88.3: Bucchero pottery from Carthage (after von Hase 1989, fig. 29)

The Caeretan origin of bucchero vases found in Naucratis and Samos is not surprising. As we have seen, many bucchero vases found at Carthage probably came from Caere. Other evidence suggests that some bucchero vases found in Miletos were also made in Caere. Thin section and petrological analyses of bucchero samples found in the Aphrodite sanctuary on Zeytintepe

in Miletos show values very close to those of similar analyses by Burkhardt in his major research project on bucchero pottery from southern Etruria.⁴⁵⁶⁸

It is noteworthy that the older excavations of Carthage yielded more than twenty Etrusco-Corinthian vases. These are Etruscan imitations of Corinthian pottery that were very popular in Vulci and Tarquinia but less so in Caere, the Etruscan city that imported the largest quantity of Corinthian pottery and therefore had less interest in imitations. Janos-Györgi Szilágyi classified the Etrusco-Corinthian vases found in Carthage as imports from Vulci and Tarquinia, all of which date to the first half of the sixth century. These classifications have recently been confirmed by some new Etrusco-Corinthian fragments found during two German excavations near the Decumanus Maximus of Roman Carthage, led respectively by Friedrich Rakob and Hans-Georg Niemeyer. The number of imports from Tarquinia, and particularly for the vases of the “Pittore senza Graffiti,” has thus increased.⁴⁵⁶⁹ In Carthage, Etruscan transport amphorae have yet to be found, but it would not be surprising if they do appear.⁴⁵⁷⁰ These results are again compatible with the Etruscan finds from Miletos, where some bucchero sherds may belong to vases from Tarquinia. Miletos is the findspot of the only Etruscan transport amphora identified up to now in the entire eastern Mediterranean (Fig. 14.1).

How can we interpret the bucchero and Etrusco-Corinthian vases found in Carthage? They were probably more than simple objects of trade or exotic pieces for deposition as grave goods, especially if we connect these pots, whose numbers increase between the third quarter of the seventh century and 550, to the events of the second half of the sixth century. Thanks to many historians, we know that in that time relations between Carthage and the southern Etrurian cities were particularly good and intense. The role of the Etruscans was not secondary in the mid sixth century, when the expansionist policies of Carthage, which was destined to become almost an empire in the following years, began with the expedition led by Malcus in Sicily and Sardinia.⁴⁵⁷¹

Herodotus explicitly mentions the alliance between Caere and Carthage against the Greeks of Phocaea in the battle of the Sardinian Sea in about 540 (Hdt. 1.166.1–2). It is widely accepted that the Carthaginians achieved control of Sardinia only after this battle, in the second half of the sixth century, while the Etruscans began their domination of Corsica. This alliance was probably in force at least until the second half of the fourth century, because in his *Politica*, Aristotle cited a deliberate, official treaty between Etruscans and the Punic empire, probably between Caere and Carthage. His references seem to indicate the existence of written documents (*graphai*) concerning trade and military agreements (Arist. *Pol.* 3.5.10–11). The existence of such treaties between Caere and Carthage can be supported by other historical traditions, such as the information from Polybius on the first treaty between Rome and Carthage, dated about 509 (Polyb. 3.22.4–13). Scholars currently accept the existence of this first treaty, and only a few are convinced that this is an

invention, a projection into the past of the treaty between Rome and Carthage dating to 348. Carmine Ampolo stresses the authenticity of this early treaty and dates it to the end of the sixth century⁴⁵⁷². This period at Caere is the age of Thefarie Velianas, the king of the city responsible for the construction of the temple now known as Temple B in the sanctuary of Pyrgi, the main harbor of Caere. Thefarie Velianas is expressly named in the gold tablets from Pyrgi—two in Etruscan and one in Punic—that also record the deities of the sanctuary, the Etruscan Uni and the Punic Astarte. According to many scholars, the honor of putting a Punic inscription in one of the main sanctuaries near Caere—and of consecrating it to a Punic deity—is closely connected to the alliance described by Herodotus. Perhaps to become king of Caere, Thefarie also received Carthaginian support.⁴⁵⁷³

An important find shows the existence of close personal relationships between Etruscans and Carthaginians, and probably also reflects the custom of the two peoples meeting one another in their respective cities. One of the few Archaic Etruscan inscriptions outside Etruria was found in a tomb of the Santa Monica necropolis in Carthage. Inscribed on the reverse of an ivory *tessera* in the form of a quadruped (Fig. 88.4) is *mi puinel karthazies vesqu[vacat]na* (“I belong to Puinel the Carthaginian...”). This little tablet, dating to the last quarter of the sixth century, has been identified as a *tessera hospitalis*—almost an identity card, intended to match another similar piece belonging to an Etruscan. Palaeography indicates that the tablet was inscribed in Tarquinii or Vulci. Only a few other ivory *tesserae hospitales* are known; it is not by accident that one in the form of a panther was found outside Etruria, in Rome (see chapter 79 Naso). In another tablet, only partially preserved, from the Etruscan residence of Murlo (Siena), Adriano Maggiani suggested restoring the name *puinel*[---]. If his interpretation is correct, this could be further evidence concerning relations between Etruscans and Carthaginians.⁴⁵⁷⁴ In the last quarter of the sixth century, then, after the battle of the Sardinian Sea, we can clearly see direct and personal contacts between southern Etruscans and Carthaginians, both of them *barbaroi* and therefore natural allies against the Greeks. It is also possible to accept a proposal by Dietrich Berges, who included Etruscan people among the possible clients visiting the state archive in Carthage.⁴⁵⁷⁵

Fig. 88.4: *Tessera hospitalis* from Carthage (after Pugliese Carratelli 1986, fig. 55)

We may therefore conclude that the presence of rich Etruscan Archaic finds in western North Africa was due not only to trade, but in some cases also to direct relations with Etruria, particularly with Caere.

In the Greek colonies of North Africa, in contrast, we can ascribe the Etruscan finds to indirect contacts through trade. This may be the case of the bucchero *kantharoi* in Taucheira and Naucratis and of the other bucchero vases from Naucratis recently published by Phil Perkins. Bucchero sherds are known to have been found at Karnak in Egypt and Tipasa in Algeria. Thanks to information kindly provided by Pierre Rouillard, we know that only one Etruscan sherd has been found at Karnak—of a small amphora dated to 600.⁴⁵⁷⁶ The Etruscan bucchero vases found in Greek sanctuaries can generally be considered gifts from merchants returning home, as can be seen from the Greek names inscribed on bucchero vases dating to the first half of the sixth century found in Perachora, Ialisos (on Rhodes), and Sicily (in Selinous and now in Leontinoi). These include a Nearchos in Perachora and probably a Leukios in Leontinoi (see [chapter 87](#) Naso).

What is quite surprising in North Africa is the absence of Etruscan bucchero at Cyrene. This may be due to the scarcity of Archaic pottery published from the site. What has been found in Cyrene, however, is a bronze fragment belonging to an Etruscan utensil, which Mario Zuffa identified as an *infundibulum*,⁴⁵⁷⁷ a very elaborate funnel that was part of a wine set. It is in

the form of a small bronze frog with a hole bored through it and a cutaway to fit a tang by which the frog could be attached to a bronze handle. The frog held a strainer that was originally fixed with rivets. Both frog and strainer could be lifted up and the funnel used alone. *Infundibula* usually have a handle in the form of a lyre that ends in a duck's head with a long bill, or more rarely in a ram's head. It is quite common for the hinge to be T-shaped, or, if representational, a lion couchant, a frog, or occasionally a sphinx. These utensils are a typical Etruscan invention, and were used for pouring wine, for instance from a krater into a *oinochoe* or from a *oinochoe* into a *kantharos*. In the second half of the sixth century they were very popular all over the Mediterranean (Fig. 88.5). *Infundibula* from that period are the counterpart in bronze of the bucchero *kantharoi* from the first half of the same century; they are a real Etruscan marker, one of the valued *tyrrhenoi chalkoi* celebrated in ancient Greek literature. Since Zuffa's article, which listed twenty-eight of them, many new finds have surfaced. We can now list more than 100 *infundibula* belonging to at least four main types: (1) lyre-handled (the most common, with subtypes); (2) similar but without tang, known from San Martino in Gattara; (3) palmette-handled; (4) special forms, including non-Etruscan examples.

Fig. 88.5: Diffusion of bronze *infundibula* (map compiled by A. Naso)

Although many have appeared on the art market with no provenance, the findspots, when known, are significant. In Italy they are quite widespread. The main source is southern Etruria, but they have also been found in

Campania, Umbria, ancient Picenum (corresponding to the modern-day southern Marche and northern Abruzzo), and the modern-day Veneto; several examples have been found in Sicily. Outside Italy there are four from Spain, one from Cyrene, three (or more) from Olympia (one with a Greek inscription), one from Argos, one from Ialisos on Rhodes, one from Thasos, one from Samos, and one from Didyma. Another funnel was found in Switzerland, in the Arbedo hoard. Two further bronze fragments that represent ducks' heads, from Carthage and from Didyma, may belong to *infundibula* or to ladles, which have also been found in Greece. This wide distribution, including not only Italic regions but also the Mediterranean basin and central Europe, and the provenance of many pieces from illegal excavations during the nineteenth and twentieth centuries, seems reason enough to localize the workshop in southern Etruria. Against current opinion, which assumes only one workshop in Volsinii, the different forms (or subtypes) of the lyre-handled utensils suffice to postulate the existence in southern Etruria of more than one workshop.⁴⁵⁷⁸ One of these may have been in Vulci, where the most famous Etruscan bronze workshops flourished, which were responsible both for masterpieces, such as the rod tripods found on the Athenian Acropolis and in a Celtic grave in Bad Dürkheim near Speyer in Germany, and for everyday vases, such as the countless bronze beak-spouted jugs (Ger. *Schnabelkannen*) that were destined for long-distance trade in the territories north of the Alps (see [chapter 82](#) Baitinger). Seven *Schnabelkannen* have also been found in Carthage.

An Etruscan archaic bronze mirror from Sestino (prov. Arezzo) has stylistic influences of a mirror group from Mit Rahineh in Egypt, dated to the end of 7th cent. BCE. Two Egyptian mirrors of this group have been found in Greek sanctuaries and show the distribution in the Mediterranean of these artefacts; one can presume Egyptian mirrors arrived to Etruria through direct or indirect contacts⁴⁵⁷⁹.

3From the Late Archaic to the Hellenistic period

Herodotus reports that in the early fifth century, Dionysios of Phocaea fought against Etruscans and Carthaginians (Hdt. 6.17), who, according to the same historian, shared a common fate in the battles lost against the Greeks of Syracuse (the Carthaginians in Sicily at Himera in 480, the Etruscans in the Sea of Cumae in Campania in 474). From Diodorus Siculus we learn that at the end of the fourth century, Samnite, Etruscan, and Celtic mercenaries fought for Agathocles of Syracuse against the Carthaginian army (Diod. Sic. 20.11.1). The few, but relevant, archaeological finds may confirm the relationships that underlie these encounters.

In this context we must mention a find that is not Etruscan. A chamber

tomb in Tunisia near Ksour es-Saaf, not far from Mahdia, yielded an impressive triple-disc cuirass of gilded bronze, perfectly preserved, in 1909. Similar cuirasses, datable to the end of the fourth century, are common in southern Italy among Samnites, Lucanians, and other Italic populations.⁴⁵⁸⁰ The interpretation of the cuirass is not clear: is it war booty? Or is it the ceremonial attire of an Italic soldier, or rather officer, of Agathocles? Both are possibilities.

In Carthage and Cyrene, there are also some red-figure Etruscan plates of the Genucilia class, dating to the end of the fourth–early third century.⁴⁵⁸¹ This pottery was produced in several workshops, one of which was in Caere. The find of a 50 cm high marble *cippus* in the “Salammbô *tophet*” shows the probable presence of an Etruscan from Caere in Carthage. Such *cippi* are typical markers for male tombs in Caere from the fourth century onward. It would seem very probable that this *cippus* was the gravestone of an Etruscan who died in Carthage, perhaps in the early third century.⁴⁵⁸² Relationships between Etruscans and Punic people may also be presumed in the second century, thanks to a small bronze disc with an Etruscan inscription found in a Punic grave near Gouraya in Algeria. The Etruscan inscription mentions an Etruscan personal name, *pumpun larthal*, meaning “Pumpun (son) of Larth.” Can the absence of a praenomen for Pumpun mean that the relationships stated on the disc were with all the male members of the Pumpun family, i.e. with all the sons of Larth? According to Dominique Briquel, this is a possibility.⁴⁵⁸³

It is not coincidental that, in the fourth and third centuries, when the Roman armies were conquering Etruria city by city, some northern Etruscans fled their land to find a new homeland in Africa. This could explain how the longest Etruscan inscription, the *liber linteus* (now in the Zagreb National Museum), written on linen cloth carbon-dated to within twenty-five years of 390, came to be found in Egypt. The palaeography suggests that the inscription dates from the end of the third to the second century. We do not know whether the Etruscan book was written in Egypt or, as seems more likely, was taken to Egypt, where it was used to wrap a mummy. This is presumed to have happened quite late, perhaps after the Perusine War (41–40), because its characteristics suggest that the book was written by a scribe from a north Etruscan area such as Perugia (Perugia).⁴⁵⁸⁴

Finally, eight Etruscan inscriptions on three boundary stones, found in Tunisia in the hinterland of Carthage, name the same person, the Etruscan Marce Unata Zutas (Fig. 38.6). Because Unata is a typical name from Clusium and its district, they probably relate to the escape from Clusium in 82 of the Roman consul Cn. Papirius Carbo and his Etruscan friends mentioned by Appian.⁴⁵⁸⁵

Thus the presence of Etruscans in North Africa was a persistent phenomenon, a feature of the *histoire de longue durée* of this region.

Abstract: The presence of Etruscans in southern Gaul, from Liguria to Catalonia, raises the problem of the articulation between the physical facts of commerce (coins and imported amphorae, bucchero, and bronze) and the weak indications of the physical presence of Etruscans living in the area (cooking pottery, inscriptions). Given the current state of knowledge, only the site of Lattes, between the end of the sixth and the beginning of the fifth cent. BCE, offers an example of Etruscan settlement in a house-warehouse near the city wall, just when the importation of Etruscan products began a severe decline all across the shores of Gaul. The chronological presentation of the sources on the presence of Etruscans on the Gaulish coast, from the seventh to the third century, recalls the various controversies about the relationships between commerce and the origin of the merchants, the conflicts over control of the seaways between the various participants in trade, and the motives that might have led some Etruscans to live in southern Gaul.

Keywords : commerce, settlement, Gaul, migration

Introduction

To approach the theme of the Etruscan presence in the Gaulish Midi is to confront the problem of the “installation” of the Etruscans or of a possible permanent settlement (“stanziamiento stabile”), all the more so since there is now a great deal of evidence—notably graffiti and cooking Etruscan pottery—that suggests the presence of individuals of Etruscan culture who had immigrated to the area.⁴⁵⁸⁶

The increasing number of discoveries complicates the problem of these migrations and modes of trade but does not fundamentally alter it.⁴⁵⁸⁷ In fact, the chronology and the historical framework, as they were presented in 2002 at the Istituto di Studi Etruschi ed Italici colloquium “The Etruscans from Genova to Ampurias” are fully up to date.⁴⁵⁸⁸ This meeting, published in 2006, was accompanied by two exhibitions whose catalogues also provide a series of syntheses, under the titles “The Etruscans in France” and “The Etruscans and the Sea”.⁴⁵⁸⁹

From the quantity of materials that have been found, the geographic arc from Liguria to Catalonia appears to have been the main outlet for Etruscan products in the western Mediterranean (Fig. 89.1). The chief markers of this trade are the amphorae, the bucchero, and some bronzes. The height of their distribution occurred in the sixth century, in both dwellings and necropolises. This physical evidence begins to appear toward the middle of the seventh

century (despite a few reservations) and lasted until the third. For the most part associated with the distribution of wine, they surely represent payment for purchases of metals, salt, or slaves. The absence of literary texts obliges scholars to rely on archaeological data that pose chronological problems and fail to resolve questions on the origin of the people, the reasons for their migration, the modalities of their presence, and their local impact,⁴⁵⁹⁰ such as the controversial question as to whether the Etruscans were the initiators of the distribution of their own products.⁴⁵⁹¹

Fig. 89.1: Southern France. Map of the sites quoted in the text

Two lines of research, however, have advanced considerably over the last few years, concerning the structuring of the Gaulish populations⁴⁵⁹² and the place of the Phocaeans in the history of the western Mediterranean.⁴⁵⁹³ The historical reconstruction of relations between southern Gaul and the Etruscans must in fact be resituated in the contexts of commercial competition in the

Tyrrhenian Sea and the ability of local populations to open to the Mediterranean on the basis of the length, vitality, and development of their contacts.

The present synthesis is based on the presentation of archaeological data both chronologically and regionally (western Languedoc, eastern Languedoc, Rhône delta, lower Provence, and Liguria), in order to gain an idea of the dynamics of the traffic and the modalities of the Etruscan presence.

1Early indications of the opening of the Gauls to the Mediterranean (eighth–seventh centuries)

The eighth century corresponds to the beginning of Archaic trafficking in the western Mediterranean, but southern Gaul is marked by only sporadic contacts from the seventh century. The local populations followed a relatively homogeneous cultural model that began to regionalize into two groups: the *suspendien's* culture to the east of the Hérault, following a more continental pattern, and the Grand Bassin I's culture to the west of that river, which was more open to the Mediterranean.⁴⁵⁹⁴ These settled populations, characterized by the import and adaptation of metallurgical technology, were at that point experiencing a crisis, to an extent.

According to Michel Gras, this development could not have been unrelated to possible trade with Etruscan populations.⁴⁵⁹⁵ Some very scarce indications for this trade have been found in Languedoc, including native imitations of products from Italy such as the bronze *simpula*, roasting spits, and anthropomorphic ceramic vases. There were also luxury goods from Greece, such as some pottery from the Grand Bassin I necropolis at Mailhac, or Etrusco-geometric items imitating proto-Corinthian ware dating to the third quarter of the seventh century in the Peyrou necropolis at Agde.⁴⁵⁹⁶ These distributions are contemporary with the presence of the first commercial establishments on the Ligurian coast, north of Etruria. The Chiavari necropolis at Genoa (eighth–seventh century) is the example for this trade, with the same sorts of imports that are found in the necropolis of Agde.⁴⁵⁹⁷

There is not general agreement about this Orientalizing atmosphere and the processes of distribution of these products. The absence of clear signs of trade, such as the bucchero *kantharoi* of the later period, makes it difficult to reconstruct traffic in southern Gaul and to place the Etruscans in a distribution system where, among the imported materials, materials from eastern Greece predominate. On the basis of isolated objects, the use of tableware and the emergence of the banquet theme suggest *chieftain's trade*, a system of exchange based on gifts and counter-gifts in societies dominated by an elite ruling class. This reciprocity between geographically distant elites implies a low frequency of contact, the absence of the socio-professional category of

merchants, and the acquisition of a social position linked to the possession of imported goods that are considered luxury goods because of their rarity.⁴⁵⁹⁸

2The earliest imports, and controversy over the role of the Etruscans in their trade(very end of the seventh and early sixth century)

Archaeological items, whose Etrurian provenance is undoubted, arrive in southern Gaul toward the end of the seventh century or around 600—that is, at the time when Massilia (modern-day Marseille) was founded by the Phocaeans. This period corresponds to the arrival of a new kind of trade, in the form of *emporion*, namely large-scale commerce, characteristic of Phocaean operations but not unknown to the Etruscan system already familiar from the sites of Genoa and Gravisca. The local populations at that time saw the beginnings of urbanism. Major cultural and regional gaps were created.⁴⁵⁹⁹

The pivotal period in the founding of Massilia was marked by the arrival of Greek and Etruscan products on the Gaulish coast. This phenomenon is confirmed in western Languedoc, where Etruscan amphorae are rare in the dwellings, the necropolises, and some of the Launacian hoards of metals.⁴⁶⁰⁰ They are concentrated on the coast at Pech Maho, Ruscino, and Montlaurès. In the lower and middle Hérault Valley, bucchero vessels and embossed rim basins arrived at the same time as Greek products, around 600, at Florensac, Pézenas, and even Bessan. Under the same conditions, objects of Etruscan origin are found in the Rhône delta and Provence, mostly in dwellings and primarily along the coast. The earliest levels relevant for imports, at Saint Blaise, Massalia, Tamaris, and L'Arquet, show from the beginning the simultaneous presence of Greek and Etruscan products dating no earlier than the 600s.

The only sites showing a chronological distinction with respect to the types of imports are found in central Languedoc, namely, the *oppidum* of La Liquière and the lagoon deposit of Tonnerre I. Michel Py proposes a chronological distinction between a first phase characterized by Etruscan imports (625–600) and a second phase (600–575) during which Greek material appears, while at the same time distinguishing two commercial phases and the priority of Etruscan commerce.⁴⁶⁰¹ Michel Bats suggests lowering this chronology by a quarter-century, to make it correspond with the other situations of southern Gaul, where the arrival of imports includes both Etruscan and Greek products simultaneously.⁴⁶⁰² Trade was based on meeting places stimulated and encouraged by the Phocaeans, from Naucratis to Massilia via Gravisca, with no accords or conventions to regulate travel and commerce.

The types of trade in this period thus involve both *praxis*, with the importation of bronze basins, and the *emporion*, with the massive distribution of wine, following various sea routes and various organizations of local populations, up until about 540/530. The Etruscan amphorae come from Vulci, Caere, and at least one other center that has not yet been identified.⁴⁶⁰³ The Rochelongue wreck on the Agde coast held nearly 800 kg of copper that might have been part of this trade.⁴⁶⁰⁴ As for the actual presence of Etruscans, the question remains open and focuses on the controversy over the existence of a primary Etruscan commerce or a commerce stimulated by the Phocaeans. The forms of bucchero vases between Saint Blaise and Massilia vary and suggest at least two different Mediterranean systems of consignment. Despite the idea of an Etruscan establishment at Saint Blaise, it seems that the *oppidum* was a native construction, which is not contradicted by the presence of an Etruscan graffito on an amphora.⁴⁶⁰⁵ For Massilia, the possible existence of an Etruscan quarter within the city has been suggested, because of the density of Etruscan products and the presence of ordinary pottery, which reinforces the idea of commerce right from the founding of Marseille.⁴⁶⁰⁶ As for Tamaris, the site has only one level of occupation, beginning in 600, and a house whose plan is unlike that of buildings known in the region. The urban organization of Tamaris suggests foreign elements but it is not possible to determine if these are the result of Etruscan migration, because the principal traders were Greek.

3The first half of the sixth century: Wide distribution of Etruscan products

The problem of the motivations of the first merchants to participate massively in trade on the southern coast of Gaul was succeeded by a less controversial situation with most imported products being Etruscan. The region between Massilia and Ampurias was the main outlet for this commerce.

On the Roussillon shore and in the lower Aude Valley, up to 70 km inland, Etruscan products have been found, albeit in small quantities. Amphorae, associated with transition bucchero and metal items, are rare but may have reached as far as the Atlantic via Languedoc, starting from Agde, Florensac, Bessan, and maybe even Béziers. The dynamism of the coast was then influenced by the view of the role of Agde and Bessan in the framework of the Greek network. Of the amphorae discovered at Agde dating between 560 and 520, 58% come from Etruria.⁴⁶⁰⁷ Relations with eastern Languedoc were not uniform: amphorae have been found mostly on the coast, but tableware has been found in the inland. The local populations gradually abandoned the lagoon sites and gathered around the Lez river. The period between 570–530 saw the arrival of a higher number of Etruscan than Greek imports,

demonstrating lasting and regular relations with Etruria. In the area of Massilia, Etruscan links were favored, but there were also links with the Greeks and Phoenicio-Carthaginians of the eastern Mediterranean basin. The manufacture of ceramics at Massilia began during the first quarter of the sixth century, and imports of Etruscan and Greek ceramics in the hinterland are fairly rare. As for the Massif des Maures, Esterel, and Liguria, commerce used the maritime route, as is shown by the number of wrecks, but the absence of power centers places this region off the beaten path.

Two wrecks from this period illustrate the coexistence of different types of traffic, one from the Cap d'Antibes and one from the Isola del Giglio. The first, dated to between 600 and 540/530, carried 180 Etruscan amphorae versus only three of a Greek type, and Etruscan *kantharoi*, pitchers, *kylikes*, and plates. The homogeneity of the cargo is reinforced by ship's fittings that were also of Etruscan or Etrusco-Punic origin whose culture resembles those of Massilia from the same period. Conversely, despite a predominance of amphorae from Caere and Vulci, the boat from Giglio (dated to 590–580) shows greater heterogeneity in Greek provenance and a larger quantity of this type of material. A hallmark of commerce in the first half of the sixth century is traffic that is mixed and quite varied, ranging from lengthy shopping trips, as the homogeneity of the cargo from Cap d'Antibes suggests, to hugging the coast, as exemplified by the ship from Giglio.⁴⁶⁰⁸

4From 540/530 to 480: Etruscan presence and Massilian competition

This was a decisive period in the consolidation of the local populations, with the creation of many sites and an economic and social transformation of the populations.⁴⁶⁰⁹ These changes are also visible in the significant fall-off in Etruscan imports to Gaulish sites in favor of products from Massilia. The commercial advantage seized by Marseille is definitely linked to the establishment around 540/530 of its own vineyard and the arrival of Phocaean populations in the wake of the destruction of Phocaea and the defeat of Aleria (535) by the Etrusco-Carthaginian coalition.⁴⁶¹⁰

Beginning in 525, 70–95% of all amphorae imports into southern Gaul were from Massilia, more quickly or less depending on the region. In Roussillon, bucchero was not found in Ibero-Languedoc dwellings after the third quarter of the sixth century except residually. Amphorae were still found, but in reduced quantities compared with Iberian and Greek products and, paradoxically, were more widely distributed in the interior country. In the new sites of Pech Maho and Montlaurès, the imports are above all Iberian and Massilian, and less often Etrurian. In the Agde area as far as the Rhône delta, sites spread toward the shore between 525 and 500 and became stopovers in

the wholesale trade primarily from Massilia. The symbolic Etruscan drinking vessel, however, is found in the necropolises of central Languedoc in the second and third quarters of the sixth century, with Etruscan amphorae used for a very short time as ossuaries, notably at Pézenas. In the area around Massilia, the native dwelling became fixed around 500, and a change can be observed in the typology of both Etruscan bucchero and amphorae, with a considerable reduction in quantity.

The only exception to this process concerns the site of Lattes, founded around 500, when the site of Cougourludé at the mouth of the Lez (abandoned around 450) was still operating, which around 600 had both Greek and Etruscan imports. The earliest levels of the founding of the fortified site of Lattes had mostly homogeneous Etruscan imports and a considerable presence of Etruscophones.⁴⁶¹¹ The house, or warehouse, occupied by these Etruscans, judging by the pottery and the inscriptions, burned around 475, and the site thus lost its uniqueness concerning the provenance of its Mediterranean provisions.⁴⁶¹² In the immediate countryside of Lattes, thanks to the role of the *oppidum* Sextansio (and maybe of Béziers as well), the proportion of amphorae during this period was thus considerably higher than in the rest of Gaul.

This period of “democratization” of trade is also marked by a larger number of discovered wrecks. The Grand Ribaud F ship, beached on the island of Porquerolles, bore a cargo of more than 800—and as many as 1000—Etruscan amphorae, metal items such as bronze basins, and fittings with graffiti indicating Etruscan provenance. This ship may have been used in trade with Lattes and Liguria, an area into which Etruscan territory was expanding at that time. The wrecks of Bon Porté 1, Dattier, and Pointe Lequin IB display mixed cargoes, mostly from Massilia.⁴⁶¹³

At the end of the sixth century, it is thus possible to identify the individual presence of Etruscans at least in Languedoc at a time when the distribution of their products was considerably reduced in the face of Massilian commercial strength but was nonetheless at its peak in the countryside. Furthermore, contact with southern Gaul favored the spread of the merchandise to other regions, notably along the Rhône Valley and toward the Atlantic. The material is sporadic, but it demonstrates a heavy demand, on the part of local elites, for Mediterranean products since the Villanovan period, as shown by an eighth century razor, shaped like a half-moon, found at Bourges, or fibulae found at several sites in the Loire region. Archaic statuettes, often without context, or pieces of furniture are also found at several sites in the area. In the Rhône Valley, Etruscan products are a minority of the imports but they reach as far as Lyon. Etruscan tableware, notably bucchero *kantharoi*, was imported from the beginning to the third quarter of the sixth century. Then, until the end of the fifth century, amphorae continued to go up the river but the tableware disappeared. At the end of the fifth century, Mediterranean material no longer appears in the northern Rhône-Alps area. However, there could be several

sources of supply of these imports, and merchandise crossing the Alps complements the coastal trade of southern Gaul. For the Atlantic regions, the question of direct contacts with the Mediterranean dealers has been raised. In the necropolises of Morbihan and maritime Charente, basins of Etruscan type and *situlae* from Italy have been found alongside Greek material dating to the fifth and fourth centuries.⁴⁶¹⁴

5The fifth century (480–396): Weak indications of Etruscan presence in trade dominated by Massilia

Beginning in 480, the ascendancy of quality Massilian ceramics over the imported amphorae became unequivocal, even in the area of Lattes. Roussillon, however, continued to import mostly Iberian products. The Etruscans, though, never went away, as shown not only by their products but also by inscriptions on lead from Catalonia, graffiti from Ensérune and Béziers, and by the types of millstones and mortars.⁴⁶¹⁵ These changes are related in part to the stepping up of competition from Syracuse in the Tyrrhenian Sea. This was indeed the time of disappearance of the bucchero that had until then been the chief type-fossil of Etruscan trade.

In western Languedoc, the inscription of Pech Maho, dating to the middle of the fifth century, provides evidence of an Etruscan presence. Men called Venel and Utavu are named in this commercial treaty recording the sale of a ship involving the city of Marseille and perhaps Ampurias.⁴⁶¹⁶ The marketing of Etruscan products thus continued in Languedoc with an increasing role for Béziers, Monédière, and Agde. If the strengthening of the habitat took place around these poles, the strength of the commercial stopovers remained in the framework of principally Greek networks. Lattes continued to import Etruscan goods until the fourth century, but the quantities were greatly reduced in comparison with those from Massilia. Around the mid fifth century, the number of Etruscan graffiti falls off strongly. At La Liquière, Greek imports tripled between the beginning and end of the fifth century. The Rhône delta and the area around Massilia passed completely under Massilia's control, and Greek imports took over all the settlements in the countryside.

6The final Etruscan imports (fourth–third centuries)

In Languedoc, the fourth century saw a limited revival of Etruscan contact, with the presence of Etruscan material at Mailhac, Béziers, and Ensérune in

both dwellings and necropolises. The provisioning of Béziers, however, remained 70% Greek. Two vases that can be assigned to the Sokra group arrived between 350 and 300. The term “Sokra group” refers to a collection of ceramics overpainted with typical decoration in pink that was made in southern Etruria and the Faliscan area. This technique, in use during the fourth century, originated with the Greek painter Sokrates, who emigrated to Falerii after the Peloponnesian War.⁴⁶¹⁷

As for Agde, the city underwent a Greek reestablishment and centralized the flows of commerce, in the context of the settlements from Massilia along the coast.⁴⁶¹⁸ At Massilia, a few Etruscan commercial amphorae were still arriving along with both black-glazed and overpainted ware. Etruscan material was thus not entirely absent from commercial circulation in the Hellenistic period, but the types of products changed. They were mostly overpainted ware dating to the second half of the fourth century and black-glazed ware that primarily came from Caere. The few forms of fine tableware, standardized *skyphoi* and *kylikes*, are found in limited quantity and do not imply direct contact with the Etruscans.

7Conclusion

The preferred area of Etruscan imports on the shore of the Gaulish Midi corresponds to Basse Provence and eastern Languedoc. Imports begin toward the end of the seventh century or in the environs of 600, in keeping with an open *emporium* system, strongly marked by Phocaeen influence. Etruscan commerce did not result in a real economic network but concentrated on the exportation of products relating to the banquet (wine and drinking service) and not necessarily excluding Greek products.

The presence of Etruscans in southern Gaul is thus linked to favored and continuous trade but did not give rise to colonization. Not all the cities of the Tyrrhenian front were involved in these dealings, and the competition unrolled primarily between Caere and Vulci. Since the number of graffiti found so far remains quite small, it seems that the Etruscan establishments went from the area of Saint Blaise and L'Arquet at the beginning of the sixth century to the area of Lattes at the beginning of the fifth.

The peak of trade took place between the sixth century and around 480, the year of the beginning of Massilia's and of the organization of the seas, which did not favor the Etruscans. The Etruscans participated in trade, but their degree of involvement and the modes of their establishment on the Gaulish coasts are not yet entirely understood.

90The Iberian peninsula

Abstract: The geography, the cultural distinctions and the various historical events of the Iberian peninsula play an important role in the definition of the presence of the Etruscans and their commercial activity in the peninsula itself.

Keywords: Spain, Phoenician, Iron Age, Archaic Age, trade

Introduction

Up-to-date insights into the presence of the Etruscans and their commercial activity in the Iberian peninsula can be gained only after some preliminary considerations regarding the geography, the cultural distinctions and the various historical events of the peninsula itself.

1New approaches

Recent investigations have been based on the study of specific objects or on the typology of artifacts, focusing in particular on pottery and metalware.⁴⁶¹⁹ General reviews of the relationships between the Iberian peninsula and Etruria are limited,⁴⁶²⁰ but the Barcelona Congress⁴⁶²¹ must be mentioned as representing a turning point in the research. Although a continuous stream of contributions did not ensue, the general works of Massimo Botto and James Vives-Ferrándiz⁴⁶²² or Giacomo Bardelli and the present author,⁴⁶²³ the Catalan synthesis,⁴⁶²⁴ and some specific articles should be recognized.⁴⁶²⁵ Despite the limited attention this subject has received, the number of findings increases constantly and a comprehensive review (including a catalogue of Etruscan objects from the Iberian peninsula) appears to be necessary to improve our knowledge. Such a catalogue will not be presented here, but we offer a general overview and illustrate the state of our knowledge about the relationship between Etruria and Iberia, with special attention devoted to its leading actors.

As for the geographical situation, the Iberian peninsula shows great variation in topography and climate as well as fertile soil and several deposits of mineral resources, mostly in the south, in modern Andalusia (Fig. 90.1). A series of mountain ranges appear to divide the country, but important river

valleys, such as the Ebro, Segura, and Guadalquivir allow communication among different cultural regions, from the coast to the interior.

Fig. 90.1: Distribution map of the Etruscan imports in the Iberian peninsula

From a cultural point of view, the well-studied indigenous dynamics developed from the Bronze Age on allow us to recognize a varied range of cultural phenomena, which influenced the exploitation of the resources and contact with peoples of the Mediterranean, including their local development. In the southern part of the Iberian peninsula, the Bronze Age communities rapidly built hierarchical societies that turned into “monarchies” during the Iron Age. These societies took advantage of access to resources, especially in

Andalusia, thus representing an early interest in establishing wide-ranging Mediterranean contacts with both Phoenician and Italic populations. The Tartessian culture, mythicized through Argantonios and Kolaïos (Hdt. 4.152), reveals an image of an orientalized society, midway between local traditions and Phoenician influences, the latter being spread through colonies and factories at the mouths of many Andalusian rivers. Conversely, the northeast of the Iberian peninsula was linked to southern France as a prolongation of the routes that connected the peninsula to central Europe and northern Italy, hence allowing the circulation of people and ideas. Contacts with southeastern France and with the dynamic local entity Aquitania (which meant access to tin resources) represented an interest and an external pole of attraction that led later to the founding of the phocaeen-massaliote colony of Emporion (Strabo 3.4.8). The eastern regions of the Iberian peninsula, set between these two areas, show features of both groups that intermingle and develop in different ways over time, even though the mouth of the river would shortly reveal a specific aspect. This seacoast was more and more influenced by Phoenician trade and broadened from the south towards the Ebro valley, and so it has traditionally been connected with the impact that supposedly followed the founding of Ibiza by the Phoenicians around 635 BCE (Diod. Sic. 5.16.23). Finally, the inland of the peninsula, apparently not as developed as the coastal regions during the Bronze Age, grew quickly and became attractive during the fifth century.

Finally, the historical circumstances of the western Mediterranean and their interpretive paradigms must be considered. Unfortunately, research has often mistaken Italic materials found on the Iberian peninsula for evidence of contacts with the Etruscans (the same misunderstanding involving the southern part of France), both for the precolonial and the archaic and late archaic periods. Even if the presence of Etruscan objects is marginal, their arrival on the Iberian peninsula must be interpreted as the result of circuits that varied according to period and region: natives, Semitic (Phoenician or Punic) dealers, Etruscans, and Greeks. A parallel is found in the archaeological evidence. The local intermediation began between the seventh and sixth centuries, and constituted the ultimate termination of the relations with the Golfe du Lion in the west. Immediately afterward, the western part of the peninsula began to participate in the great historical events from the late archaic to romanization, according to both historical and archaeological sources. From a historical perspective, the role played by the Iberian peninsula (especially the southern part) is considerable as an area strongly influenced by the Punic world, not to mention some well-known *topoi* of the history of the ancient Mediterranean. The phocaeen-massaliote colony of Emporion, the city of Saguntum, and the Ebro river were the setting, limit, and reason for the beginning of the Second Punic War and, afterward, for the romanization of the Mediterranean.

This is the explanation provided by current information and interpretation

for the arrival of Etruscan objects in the Iberian peninsula by means of native distribution, Punic or Greek intermediation, and direct Etruscan trade.

2Chronological sequence

The following chronologically organized interpretation is based strictly on the analysis of archaeological data, since there is no written account of Etruscan presence in the western Mediterranean.⁴⁶²⁶

2.1Before the sixth century

According to the available data, the presence of Etruscan materials on the Iberian peninsula before the sixth century is demonstrated only by two fragments of Villanovan pottery found in the Phoenician enclave of Huelva from the first quarter of the eighth century, which can undoubtedly be interpreted as a result of wide-ranging Phoenician trade, including even Sardinia.⁴⁶²⁷ It is possible to add to these fragments three bronze *oinochoes* of Rhodian type from a Phoenician-andalusian milieu dating slightly later, from Granada and the necropolis of La Joya, in Huelva.⁴⁶²⁸ These finds must be seen as later evidence of the orientalizing trade that expressed the richness of the Tartessian aristocracy as well as the power gained by those aristocracies who kept up relationships with Phoenician colonizers. Another result of this process is the ceramic imitation of a ribbed bowl from Peña Negra and the hybridization between a ribbed bowl and an Orientalizing *thymiaterion* stand from Peñon de la Reina.⁴⁶²⁹

Outside the southern peninsula, no evidence is found, while some other items, traditionally considered as such, now need to be expunged. An Italic bronze sword of the Terni type, allegedly from Bétera or Tortosa and dating around the eighth century, has been interpreted as the most ancient evidence of contact with the Etruscan (or Villanovan) world, but recently it has been proven to be a false provenance and proposed an explanation for the presence of the sword in the Iberian peninsula as the result of a nineteenth-century antiques sale.⁴⁶³⁰

Very surprising is the rarity, in some places, and the absence, in others, of small ornaments, in particular fibulae, which are quite common outside Italy beginning in the sixth century. Even if fibulae dating earlier than the sixth century are still under discussion for the northeast and are completely absent from archaeological evidence in the rest of the peninsula, the problem persists for those dating to the first half of the sixth century, mostly as to their filiation. A short catalogue of these fibulae is available. They are of North Italic type, or at least not exclusively Etruscan, and have been found around

Empúries, dating to the sixth century.⁴⁶³¹ Thus they have been interpreted in connection with overland relations with the communities of Golasecca or Liguria, rather than with Etruscans. These contacts, noted in southern France, did not represent a form of precolonial relations,⁴⁶³² but are most likely to be interpreted as the result of the circulation of Italic items in the Golfe du Lion within a system of “native” exchange.⁴⁶³³ This situation explains a particular distribution of types and some associations of materials during the sixth century in the northeast, which turns out to be different from the rest of the peninsula, as demonstrated by their interaction in subsequent times.

2.2The sixth century

A very different impression emerges for the sixth century from excavations, which increased after a review and the identification of some Etrusco-Corinthian and Etruscan materials found in nineteenth-century excavations in the necropolis of Empúries.⁴⁶³⁴ Some imported Etruscan pottery found around the future colony of Emporion, settled in 575, can be dated to the first quarter of the sixth century. This first pottery, which is very rare, includes for the most part, amphorae of Py type 3a/3b⁴⁶³⁵ and bucchero *kantharoi* of Rasmussen type 3e,⁴⁶³⁶ typologically old, but from a context to be placed after the settlement of the Phocaean colony. From this very moment on, after an initial decline in Etruscan imports, the percentage of Etruscan trade amphorae increases, overtaking the percentage of Greek trade amphorae, whose numbers increase only at the beginning of the fifth century.⁴⁶³⁷ Pottery, always in a modest amount, can be included among the series distributed in the Golfe du Lion during the same period, mostly *kantharoi* and bucchero *oinochoes* and other artifacts including mortars and Etrusco-Corinthian vases (Fig. 90.2). The limited import of Etruscan pottery in the interior of Empúries includes a minor presence in the Vallés area, which had contacts with the district of Empúries and southern France, and in the Ebro zone, where the imports have been wrongly interpreted as a consequence of Phoenician trade.⁴⁶³⁸ In the south, Huelva continues to be the point of reference for some Phoenician workshops where Etruscan imports are reduced to a group of *kantharoi* of Rasmussen type 3e and some trade amphorae associated with Greek objects. This case falls within a Greek-Ionian trade dynamic, according to scholarly interpretation, although an active Phoenician commercial web could be imagined that involved Sardinia and the harbors of Tyrrhenian Etruria.

Fig. 90.2: Etrusco-Corinthian vase from Puig de Sant Andreu, Ullastret, Girona (after Sanmartí, Asensio and Martín 2006, fig. 3)

On the other hand, metal objects have been found in the northeast. From the interior of Empúries come respectively a chariot pole tip in the shape of a lion's head (Fig. 90.3), which has been considered a find from the necropolis of Portitxol (with many problems concerning the interpretation),⁴⁶³⁹ and a small number of metal items. In both Emporion and Ullastret, remains of *infundibula* have been found, in Ullastret two situlas,⁴⁶⁴⁰ and in Emporion possibly an *omphalos* bowl of the Cook type,⁴⁶⁴¹ which includes both Greek and Etruscan banquet elements.

Fig. 90.3: Bronze lion's head from Emporion, l'Escala, Girona. MAC-Barcelona (Photo Graells)

Outside this area, only an *omphalos* bowl of the Cook type,⁴⁶⁴² another bowl imitating Etruscan models, and a ribbed pail (which cannot be considered Etruscan but rather North-italic)⁴⁶⁴³ were found inside a warrior's grave of the second half of the sixth century, as seen in southeastern France, hence showing a native interest in including this kind of element among grave goods. This dynamic is normally disconnected from Mediterranean trade circuits and represents an indigenous initiative connected to land routes along the Golfe du Lion.⁴⁶⁴⁴

On the other hand, direct Etruscan trade could explain the circulation of some ceramic (amphorae and bucchero) spread along the coast from Castellón to the area of Vallés (Fig. 49.2). It is interesting to underline the coincidence of some Naucratic elements, such as scarabs and new year's flasks (It. *fiache di Capodanno*), with parallels in Gravisca and Pyrgi, especially if we consider relations between Naucratis and this part of Etruria.⁴⁶⁴⁵

2.3The fifth century

In the fifth century, we observe a change in the process of Etruscan imports. Pottery is reduced and confined to Punic contexts, with considerable representation of amphorae of Py type 4, while the amount of tableware decreases and metal vessels are strictly limited and assigned only to local

elites. For this reason, this metal ware is found neither in colonial contexts nor in the area under Punic influence, but solely in emerging local contexts, associated with imports that can be connected to beverage consumption⁴⁶⁴⁶ and toiletries.⁴⁶⁴⁷

While the first ceramic imports were localized in the interior of Emporion and the first metal ware is found—following a model typical of southern France—inside local contexts, during the fifth century we encounter emporic trade addressed to the needs and tastes of the Iberian peninsula, which was possibly controlled by Etruscans, as the considerable number of amphorae seems to suggest. This statement is confirmed by the typological differences between the Etruscan metal vessels from southern France and the ones from the Iberian peninsula during the second half of the sixth and the entire fifth century, where neither embossed rim basins nor *Schnabelkannen* (with one exception) nor a similar quantity of *kantharoi* or amphorae have been found, but only certain types, including *infundibula*, strainers and *olpai*.

The *infundibulum*, perhaps produced in *Volsinii* (Orvieto) or Vulci, is the most frequent Etruscan metal utensil among known objects,⁴⁶⁴⁸ but its distribution seems complex, since we know two from the northeast (Ullastret, Girona;⁴⁶⁴⁹ Empúries, Girona), while the other three examples come from the southeastern part of the peninsula one from Xàbia, Alicante,⁴⁶⁵⁰ an area with a predominant role in the reception of Etruscan pottery; and two more from the palace-sanctuary of Cancho Roano (Fig.90.4).⁴⁶⁵¹ Apart from these objects, the strainers stand out because they were all found in the southeastern region, in inner Andalusia, while only one is present on the coast. This, found in tomb 32 of the necropolis of Poble Nou (Villajoyosa, Alicante), is associated with Attic black-figure pottery of the Haimon Group of the second quarter of the fifth century.⁴⁶⁵² This example allows the dating of the others (Alcurrucén – Pedro

Abad, Cordoba;⁴⁶⁵³ Mirador de Rolando, Granada;⁴⁶⁵⁴ Iznalloz, Granada⁴⁶⁵⁵) and falls into an emporium manner of trade, whose promoters can hardly be identified, although the wreck from Sec strongly suggests a Punic⁴⁶⁵⁶ leading role in dealing exclusively with local aristocracies. The discovery of various Etruscan jugs support this statement. Some of the finds that supporting this are the series of jugs with *kouros* handles,⁴⁶⁵⁷ (Fig. 90.5) the *Schnabelkanne* from tomb 57 in the necropolis of Cigarrelejo,⁴⁶⁵⁸ and the contexts of the *olpai* with raised handles (El Oral;⁴⁶⁵⁹ Alcurrucén-Pedro Abad, Cordoba;⁴⁶⁶⁰ Escuera, Alicante;⁴⁶⁶¹ Mirador de Rolando, Granada;⁴⁶⁶² two examples from the ancient collection Saavedra, probably of Andalusian origin;⁴⁶⁶³ Segóbriga, Cuenca; and tomb 255 in the necropolis of Cabecico del Tesoro, Murcia⁴⁶⁶⁴). The significance of this distribution is the prominent role of inland Iberian elites, who are the only ones who accumulate and exhibit objects related to drinking. This should not be underestimated, since it shows a particular ideology of social achievement restricted to the southeast of the Iberian

Fig. 90.4: *Infundibulum* from Cancho Roano, Zalamea de la Serena, Badajoz (after Gran-Aymerich 2006, fig. 3)

Fig. 90.5: Oinochoe handle from Málaga (after Blanco 1965, pl. 31)

2.4The fourth century

In Punic colonies on the peninsula, in the fourth century the Etruscan component is replaced by Punic products, which could rapidly supply even the interior of Emporion. In Emporion itself a certain degree of Etruscan activity and presence remained, as is demonstrated by a mirror engraved with the judgment of Paris⁴⁶⁶⁶ (Fig. 90.6) and by a series of bronze votive figures⁴⁶⁶⁷ and a candelabrum foot with a votive inscription (Fig. 90.7).⁴⁶⁶⁸ In this century the Etruscans are almost absent from the western Mediterranean, so this should be considered the time of the end of relations with them, versus increasing Campanian and Punic trade. Nevertheless, the Etruscan presence is demonstrated through important evidence of the circulation of mercenaries between Etruria and the Iberian peninsula, such as two exceptional helmets found in a wreck at the mouth of the Llobregat River, near Gavà.⁴⁶⁶⁹ (Figs.

90.8.–90.9). This explains the diffusion and the use of the *falcata*, an Iberian weapon for which Etruscan origin and subsequent local development have been proposed.⁴⁶⁷⁰ This topic cannot be discussed here, and these weapons are in no way direct or material evidence of Etruscan presence in the west. Finally, contemporary with the helmets are some Etruscan scarabs *aglobolo* found along the peninsular coast.⁴⁶⁷¹

2.5 The third century and the Roman conquest

The course of historical events in the Mediterranean influenced the western regions in the third century, when we begin to find considerable amounts of imported Campanian pottery, while Etruscan trade is very rarely present and then only in isolated cases, in the late third and the second centuries, underlining even in the west the end of the Etruscan world and the beginning of Roman domination.⁴⁶⁷²

3 Conclusions

The shortage of Etruscan archaeological evidence and its scattered distribution, consisting of a mixed selection of pottery and other materials, have hindered analysis of complex relations. The fact of Etruscan objects in the Iberian peninsula forces us to consider every possible variable, depending only on the historical moment and the region.

Therefore, while we cannot date an Etruscan presence before the middle of the seventh century, the earliest evidence can be interpreted in connection with native peoples regarding metal ware in the northeast—Etruscan for the interior of Emporion and Phoenician for the area of Tartessos. Immediately afterward, beginning in the middle of the sixth century, and with the growth of the influence of Emporion, Phocaeen trade monopolizes Etruscan imports and redistributes them in the northeast, while in the southern area the volume of imports decreases and is shown only by some amphorae in Phoenician colonies. This situation changes rapidly during the fifth century, as Iberian elites begin to accumulate metal vessels and symposium items, combining them with Greek vessels, as a result of an emporium style of trade. Only in the fourth century does the limited number of Etruscan materials outside Emporion mark the end of these relations, if they had not already been interrupted at the end of the sixth century. In fact, after the beginning of the fifth century, the reduced number of Etruscan objects gives way to a selection of refined items, representing the prolongation of relationships based on gifts, supported by the success of the Phocaeans and the development of the Punic enclave on the peninsula.

Figures

Part 1

4 Della Fina

Fig. 4.1 Thomas Dempster, *De Etruria regali*, Florentiae 1723 (photo Della Fina)

Fig. 4.2 Anton Francesco Gori, *Museum Etruscum*, Florentiae 1737 (photo Della Fina)

Fig. 4.3 Coat of arms of the Accademia Etrusca in Cortona (photo Della Fina)

Fig. 4.4 Portrait of Luigi Lanzi (1732–1810). Oil painting, circa 1800 (photo Della Fina)

Fig. 4.5 View of the Campanari Garden, Tuscania (after Dennis 1848)

6 Lubtchansky

Fig. 6.1 Tarquinia, Tomb of Inscriptions (after Torelli 1997, 134, fig. 107)

Fig. 6.2 Calyx-krater from Vulci (after *Monuments Inédits* 1834, pl. 9)

7 Benelli

Fig. 7.1 Portraits of famous linguists

10 D'Ercole

Fig. 10.1 The chariot of Bisenzio. Rome, Villa Giulia (after Woytowitsch 1978, pl. 24)

Fig. 10.2 Main types of Etruscan trade amphoras (after Py 1985, fig. 2)

11 Egg

Fig. 11.01 Chronological development of Etruscan helmets (drawing M. Ober, RGZM)

14 Colivicchi

Fig. 14.1 Etruscan wine amphora from Miletus (photo A. Naso)

Fig. 14.2 White-on-Red pithos with Ulysses blinding Polyphemus (from Menichetti 2002, 91 fig. 16)

Fig. 14.3 Terracotta frieze of Murlo, banquet scene (from Menichetti 2002, 85 fig. 9)

Fig. 14.4 Terracotta frieze of Acquarossa, banquet scene (from Menichetti 2002, 88 fig. 11)

Fig. 14.5 Sarcophagus of the Spouses, from Caere, detail. Museum of Villa Giulia, Rome (foto SAR-Laz)

Fig. 14.6 Orvieto, Archaeological Museum, fresco of tomb Golini 1, detail (from Torelli 2000b, 254)

16 Cherici

Fig. 16.1 Bisenzio, necropolis of Olmo Bello, Tomb 22. Bronze situla (detail). Rome, Villa Giulia (photo SAR-Laz)

Fig. 16.2 *Oinochoe* of the Painter of the Stretched Horses (detail). London, British Museum

Fig. 16.3 Amphora of the Painter of the Heptachord (detail). Würzburg, Martin von Wagner Museum

Fig. 16.4 Tragliatella, *oinochoe* from the necropolis (detail). Rome, Musei Capitolini.

Fig. 16.5 Choreography with the movements of the strophe (signed +), the antistrophe (signed –), and the epode (A and B), according to Chiarini

17 Benelli

Fig. 17.1 Distribution map of the Etruscan Inscriptions, 700–630 BC

Fig. 17.2 Distribution map of the Etruscan Inscriptions

Fig. 17.3 Table of Etruscan Abecedaries

Fig. 17.4 Table of recent age scripts

18 Maras

Fig. 18.1 Cover of an ash-urn from Pontecagnano with a pair of molded human figures with freakish features, probably representing a hierogamy. Eighth century BCE. Pontecagnano, National Museum (from *Gli Etruschi fuori d'Etruria*, edited by G. Camporeale, Verona 2001)

Fig. 18.2 Reconstruction of a terracotta statue representing Aeneas and Anchises from Veii: in the circle the only fragment found during the excavation at Veii, Campetti (drawing: courtesy of S. Barberini, Rome)

Fig. 18.3 Bronze statuette representing an infant rising from the ground, found in a sacred context in Tarquinia. Vatican Museums (after Cristofani 1985: 238, Fig. 126)

Fig. 18.4 Reconstruction of the central acroterium of Temple B at Pyrgi with Herakles and Hera (after Colonna 2000: 288, Fig. 26)

Fig. 18.5 Inscription *Fuflunsul Pachies Velclthi*, "To the Bacchic *Fufluns* at Vulci", scratched under the foot of an Attic kylix, from Vulci, Doganella. Last quarter of the fifth century BCE. Florence, Archaeological Museum (photo by D. Maras)

Fig. 18.6 Marble statue representing a nude goddess, so-called "Venere della Cannicella", from Orvieto, necropolis of Cannicella. End of the sixth century BCE (after Andr n 1967, pl. 3a)

Fig. 18.7 Bronze statuette with dedication to *aiseras Thufthicla* of uncertain provenance, probably from Volsinii. Second half of the 4th century BCE. Vatican Museums (drawing by D. Maras).

Fig. 18.8 Bronze statuette representing *Culsans* from Cortona, Porta Ghibellina. Cortona, Museum of the Accademia Etrusca (after Cristofani 1985: 209, Fig. 104).

Fig. 18.9 Bronze statuette of a child holding a bird from Tuoro, near Lake Trasimene. Vatican Museums (after Cristofani 1985: 241, Fig. 127).

Fig. 18.10 Inscription on the statuette of fig. 18.9, incised along the right leg (drawing by D. Maras)

Fig. 18.11 Pierced altar from Bolsena, Poggetto, with consecration to *Tina* (drawing by D. Maras)

Fig. 18.12 Pyrgi. Plan of the earliest layout of Temple B with its precinct and the building of "Venti Celle" (after Colonna 2007: 19, Fig. 2)

19 Naso

Fig. 19.1 Villanovan graves from Tarquinia

Fig. 19.2 Tumuli with several chamber tombs in the necropolis of Caere: the oldest tomb is always oriented north-west (after Prayon 1975, Taf. 82)

Fig. 19.3 Etruscan conception of the heaven

Fig. 19.4 Plans of grave 926 at Pontecagnano (from B. d'Agostino, *Tombe principesche ...*, Roma 1977)

Fig. 19.5 Plans of grave 928 at Pontecagnano (from B. d'Agostino, *Tombe principesche ...*, Roma 1977)

Fig. 19.6 Tarquinia, Tomba dell'Orco II: Agamemnon and Tiresias in the Netherworld; on the tree, animulae (after Steingr ber 2006, 189)

Fig. 19.7 Cinerary urn from Chiusi with Orestes killing his mother Clytaemnestra (Chiusi, Nat. Mus. 234) (Steuernagel 1998, 197 n. 75)

22 Pomey

- Fig. 22.1. a—dVillanovanian clay models of boats (9th – 8th c. BCE) (after Höckmann 2001, figs. 3–6)
- Fig. 22.1.eShip graffito on a vase from Veii (beginning 7th c. BCE) (after Höckmann 2001, fig. 8)
- Fig. 22.1.fDetail of a boat from the procession of ships on an Etrusco-Corinthian oenochoe (circa 700–675 BCE, Museum of Art & Archaeology, University of Missouri). (Drawing P. Pomey)
- Fig. 22.2Bronze ram (Fitzwilliam Museum, Cambridge) (after Basch 1987)
- Fig. 22.3.aAristonothos krater (circa 675–650 BCE, Palazzo dei Conservatori, Rome) (after Höckmann 2001, fig. 16)
- Fig. 22.3.blvory pyxide from Chiusi. (Drawing P. Pomey)
- Fig. 22.3.cWarship graffito on a vase from Tarquinia (7th c. BCE) (after Höckmann 2001, fig. 9)
- Fig. 22.3.dWarship on a vase from Vulci (beginning 6th c. BCE, British Museum, H 230). (drawing P. Pomey)
- Fig. 22.3.eWarship on the “navarch’s” stele from Felsina (Bologna) (end 5th c. BCE). (after Basch 1987)
- Fig. 22.4.aBireme on the hydria of the Micali painter from Vulci. London, British Museum, end 6th c. BCE (after Höckmann 2001, fig. 21)
- Fig. 22.4.bShip from the Tomba della Nave, Tarquinia, beginning 5th c. BCE (Drawing M. Rival, Centre Camille Jullian, CNRS, Aix-en-Provence)
- Fig. 22.4.cShip on an Attic cup. London, British Museum, B 436, late 6th c. BCE. (drawing M. Rival, Centre Camille Jullian, CNRS, Aix-en-Provence)
- Fig. 22.5Plan of the *Grand Ribaud F* wreck (drawing M. Rival, Centre Camille Jullian, CNRS, Aix-en-Provence)

23 Michetti

- Fig. 23.1Main Etruscan harbours and related cities, 600–150 BCE

24 Emiliozzi

- Fig. 24.1The cultural areas of the pre-Roman Italy that adopted the custom of burying vehicles in the tombs of the elite. The numbers indicate how many finds were known in each area in 1997. The + sign indicates the numbers that have increased since the count was made.
- Fig. 24.2Reconstruction of the fast chariot from Populonia, Tumulo dei Carri (drawing Emiliozzi)
- Fig. 24.3Reconstruction of parade Chariot I from Castel San Mariano (Emiliozzi)
- Fig. 24.4The parade chariot from Rome, Via Appia Antica, as reconstructed in the Museo Gregoriano Etrusco (drawing Emiliozzi)
- Fig. 24.5Metal roads fanning down from the side rail of the fast chariot from Populonia.
- Fig. 24.6Sixth-century parade chariots. (A) Bronze decoration on the rear side panels and shock-absorption systems of the chariots from (1) Monteleone, (2) Castro, and (3) Castel San Mariano (chariot I); (d) the chariot remains from the Barsanti collection. (B) The chariot from Castro. (C) Reconstruction of the shock-absorption system in the substructure between the chassis and the axle of the Monteleone chariot (after Emiliozzi 2011)
- Fig. 24.7The cart from Trevignano Romano, Tomba dei Flabelli. (A) detail of the trident- shaped finial. (B) Proposed reconstruction (drawing Emiliozzi)
- Fig. 24.8The iron brackets from Casale Marittimo, Casa Nocera necropolis, tomb A: (a) One bracket; (b) the axle revolving under the grooved beam

beneath the chassis (drawing Emiliozzi)

Fig. 24.9Acquarossa near Viterbo, a segment of a road in the area F (from Östenberg 1975, 193)

Fig. 24.10View of an Etruscan *via cava* near Sovana, in Fiora River Valley (photo Emiliozzi)

25 Zifferero

Fig. 25.1Distribution of metallic and non-metallic ore in ancient Etruria (Tuscany and Latium): the area between the rivers Cecina and Bruna is identified as *Etruria mineraria*

Fig. 25.2Plan of the Miniera del Cornacchino at Monte Amiata (Castell'Azzara, Grosseto), active between 1872 and 1921 for the extraction of mercury. The position of Prehistoric galleries for the extraction of cinnabar is marked on the right side of the sketch as *linea del giacimento lavorato dagli antichi* (after De Castro 1914)

Fig. 25.3Plan and section of the Etruscan mine Buche al Ferro 2 (Castagneto Carducci, Livorno), showing a complex system of pits, shafts and cultivation rooms for the extraction of polymetallic sulfide ore (courtesy A. Casini and G. Cascone; drawing by G. Cascone)

Fig. 25.4Cultivation room at the bottom of the Etruscan mine Burian-Fohn (San Vincenzo, Livorno), with discarded material from the excavation of the skarn masses (courtesy A. Casini)

Fig. 25.5Hypothetical reconstruction of Etruscan iron furnaces in the Golfo di Baratti (Populonia) area, showing the different steps of iron ore smelting, including the spilling of silicate slag and the final recovery of iron blooms through the demolition of the plant (courtesy Edizioni Polistampa, Florence)

Fig. 25.6Distribution of ancient and modern mines for working polymetallic sulfide ore around Massa Marittima (Grosseto), in the heart of the Colline Metallifere. Most places are mentioned in the text: the southern portion of plan shows the position of the Etruscan site at Lago dell'Accesa, close to the mining area of Serrabottini (courtesy L. Dallai; drawing by A. Bardi)

26 Corretti

Fig. 26.01Map of the metal resources on the island of Elba

28 Maggiani

Fig. 28.1Etruscan Bronze Mirror. Madrid, Museo arqueologico Nacional, inv. nr. 9829 (from Blázquez 1960)

Fig. 28.2Weight. Privat collection (from Bonfante 1993)

Fig. 28.3Weight. From Caere (from Cristofani 1996)

Fig. 28.4Table of Etruscan Weights (from Maggiani 2007, 147)

29 Gleba

Fig. 29.1Mantles from Tomb 89, Verucchio, late 8th century BCE: a) mantle 1; b) mantle 2 (© Cologne University of Applied Sciences)

Fig. 29.2Verucchio, Garment from Tomb 89, end 8th century BCE (© Cologne University of Applied Sciences)

Fig. 29.3Garment from Tomb B/1971, Verucchio, late 8th century BCE (© Cologne University of Applied Sciences)

Fig. 29.4Tarquinia Le Rose, Textile traces on a fibula from Tomb XLIV, early 7th century BCE; the drawings show two sides of the same fibula, preserving different textiles (after Buranelli 1983, fig. 102)

- Fig. 29.5 Scenes from the Throne of Verucchio depicting women spinning and weaving, Tomb 89, Verucchio, late 8th century BCE (after von Eles 2002, fig. 127)

- 11 See the concise and still valuable description of the situation by Banti 1959.
- 12 This direction is indicated by Cristofani 2000; Camporeale 2011; de Simone 2011.
- 13 There is no doubt that Herodotus' Creston is to be placed in Thrace; Dionysius of Halicarnassus refers to an alleged mistake made by Hellanicus to transfer Creston to Italy. A comprehensive overview about the ancient debate and the manuscripts is provided by Asheri et al. 2007, 118–119.
- 14 Cf. Sieberer 1995, 50–58; for a map see Bichler 2000, 413.
- 15 Only here is Tyrsenos added to the genealogy of the Lydian kings on which Herodotus' chronology is based; it looks like an ad-hoc invention.
- 16 This holds true even if one reckons like Briquel (1991, esp. 69–74) with a Lydian story invented at the court of Croesus following the pattern of the common descent (*syngeneia*), which Herodotus took as the model for his narrative.
- 17 FGrH 4 F 3 = Dion. Hal. *Ant. Rom.* 1.28.
- 18 Dion. Hal. *Ant. Rom.* 1.17–18 knows of an additional and different genealogy. Pelasgus is the son of Zeus and Niobe, daughter of Phoronis. In the sixth generation the Pelasgians left the Peloponnese and came to the country Haimonia (= Thessaly) from which they drove out the barbarians; the country was then named Pelasgiotis, after the Pelasgians. Six generations later, the Pelasgians themselves were driven away by the Leleges (= the Aetolians) and Curetes (= the Locri); some of the Pelasgians fled to Crete, the Cyclades and to the region close to Olympus and Ossa (= Hestiatotis), some to Boeotia, Phokis and Euboea; and some to Asia next to the Hellespontus and the islands there. Most, however, arrived at Dodona, and after a while crossed the Ionian Sea to settle at the mouth of the River Po. Later, they were driven out by the barbarians, who in turn, still later, were driven out by the Romans.
- 19 For the various ways to locate the Pelasgians cf. Sammartano 2012, 56–65.
- 20 Cf. Dionysius Periegeta 100–103, presumably dating to the second century CE.
- 21 FGrH 140 F 21 = Strabo 5.2.4.
- 22 For the aim of Dionysius's history cf. Scullard 1966 and Gabba 1991. Wiater 2011 convincingly analyzes Dionysius's conception of Rome as a continuation of Classical Athens, whereas Schultze 2000 seems to underestimate this point and therefore argues for his

(historical) “reliability.”

23 Similar to Sammartano 2012. The narratives refer to the appearance of the Lydians in Asia, the conflict of the Lydians with the Greek cities in Asia Minor, the conflict between Sparta and Athens and the formation of ethnic identities involved in it, and the Persian Wars; cf. Hall 1997; Hall 2005; Osborne 2009.

24 See Bichler 2004.

25 An overview of the sources is provided by Briquel 1984 and Sammartano 2012, 71–75.

26 Creston cannot be separated from the context in Herodotus’s story (1.56–57); cf. n. 5 above. To identify Creston with Umbrian Cortona presupposes the immigration of the Etruscans in Italy and the equation of Pelasgians and Tyrsenoi; pro: Schultze 2000, contra: Camporeale 2004.

27 Cf. Schmitz 2002, 94–97; Allen 2011; Orr 2003.

28 See e.g. Della Fina 2009; Camporeale 2011, 13–38.

29 Thomson de Grummond 1986; Cristofani 1978, 598–599; 1983; 1992.

30 Cf. Govi 1992; Haynes 1992; Sannibale 2011.

31 Micali 1810; 1836; cf. Desideri 2011; Cristofani 2001; Barocchi and Gallo 1985; Colonna 1992.

32 The myth is shaped according to the place the author comes from; cf. Torelli 2011; Colonna 2011.

33 Müller 1828, III.

34 Overviews can be found in Pallottino 1984 and Pffiffig 1969.

35 Recent finds and discussion are summarized by de Simone 2008, 2011.

36 Cf. Pallottino 1984, 57–69.

37 Cf. e.g. Ducati 1927b; Giglioli 1935; for literature see Pallottino 1984, 17–18.

38 Devoto 1931.

39 An example for the longevity of this reasoning is Devoto et al. 1954.

40 Meyer 1893, 500–504; Beloch 1913, 50–54; Gras 1985; de Simone 1996.

41 Cf. Trümpler 2008; Etienne 2000; Korka 2005; Valavanis 2007.

42 A small number of publications of some impact like Dennis 1848 only corroborates this view; cf. Strong 1968, 140: “But the English-speaking countries have produced few Etruscologists in recent times and the bulk of English reading on the subject is made up of translations of important works by foreign scholars.”; Haynes 1992, 310–319.

43 The influential German archaeologist Eduard Gerhard was one of the founders of the Istituto di Corrispondenza Archeologica in 1829; cf. Delpino 1992, esp. 342; Platz-Horster 1992; Blanck 2000.

44 Fréret 1753; cf. Homo 1953, 68–69; Briquel 1991, 49–51.

45 Niebuhr 1811, 66, 73; cf. XIII.

46 Niebuhr 1811, 70.

47 Niebuhr 1811, 73.

48 Helbig 1879, 99–107.

49 Pigorini 1882.

50 Cf. e.g. von Duhn (1924, 120, 201, 349) who took it as a matter of fact that the “Indo-Germans” were superior to all other peoples; he thought that the “embryonic germ of the subsequent Roman stately feeling” [der embryonale Keim des späteren römischen Staatsgefühls] was to be located as early as in this phenomenon.

- 59** Cf. Pallottino 1984, 88–9, 103, 149–50.
- 60** Körte 1907, 731–735, with reference to K.O. Müller.
- 61** For an overview on the so-called “Sea Peoples,” see Sandars 1985; Ward and Jukowski 1992; Gitin, Mazar, and Stern 1998; Oren 2000; and Aigner Foresti 2001, 121.
- 62** Schachermeyr 1929, 65.
- 63** This construction was picked up by Hencken 1968, 603–646.
- 64** Krahe 1949, 38–39, calls all contradicting opinions laic; an overview about the most important names is offered by Pallottino 1984, 87–89.
- 65** A^okerstro^m 1943, 156–158.
- 66** Homo 1953; similarly, Ward-Perkins 1959 and Hawkes 1959.
- 67** Säflund 1957.
- 68** Pffiffig 1989, 8; Piganiol 1953, 328–352.
- 69** Beekes 2002.
- 70** La Regina 2004, esp. 88–91; he stresses the isolated sentence in Sen. *Helv.* 7.2: “Tuscos Asia sibi vindicate”; Torelli 2009, esp. 142–143.
- 71** Bloch 1954, 13–14, 23–24; cf. also Bloch 1972.
- 72** Heurgon 1961.
- 73** Irollo 2010, 54.
- 74** Cuno 1888, esp. 17, 778, 826–829.
- 75** Bérard 1949; 1957, 470–486.
- 76** Thuillier 1992.
- 77** Cf. Pallottino 1984, 19–21.
- 78** Ducati 1927a; 1938; Nogara 1933; Renard 1941; Altheim 1950.
- 79** Pallottino 1942; 1947.
- 80** Pallottino 1948–49.
- 81** For the various strands of the ongoing debate cf. Steinbauer 1999 (“indogermanische Vorgängersprache”) and de Simone 1996; 2008; 2011, and **chapters 7 and 17** Benelli.
- 82** Pallottino 1984, 110. This thesis was supported from the beginning e.g. by Hawkes 1959.
- 83** For the lasting influence of this view see the 1986 book edited by Giovanni Pugliese Carratelli *Rasenna*, which has the motto “antiquam exquirite matrem” (Verg. *Aen.* 3.96).
- 84** Aigner Foresti 2001, 122; Aigner Foresti (2009, 18–19) refers to Meiser 1996; see also Campanile 1991.
- 85** Wolstenholme and O’Connor 1959; cf. Aigner Foresti 1974, 55–57.
- 86** Heurgon 1964.
- 87** Ward-Perkins 1959.
- 88** Perkins 2009; Jones 2006, 46–48; see also **chapter 8** Perkins.
- 89** Pohl and Mehofer 2010; Curta 2005; Pohl 1998; Freitag 2007; de Simone 2008, 179.
- 90** These questions of fundamental methodological significance are discussed by Anderson 2006; Hobsbawm and Ranger 1983; Gehrke 2010.
- 91** Presumably the best analogy, the name *Germans*, is discussed by Timpe 1991; 2006.
- 92** See e.g. Snodgrass 2006.
- 93** These questions are wittily treated by Aigner Foresti and Siewert 2006.
- 94** For religion, cf. de Grummond 2006; regarding divination in particular, many sources are

discussed in Thulin 1906, Bloch 1977, 43–128, and vols. 4–9 of Briquel and Guittard 1985–; on piracy, see Giuffrida Ientile 1983; on Latium and Etruria, McKay 1986.

95 For historiography, see Musti 1989.

96 Buonamici 1939. The index of sources in Colonna 2005, vol. 4, 2553–66, can be used to fill some of Buonamici's gaps. Barker and Rasmussen 1998, 85–116 combine a cursory overview of literary and epigraphic sources with one of Etruscan society.

97 See recently Bonfante 2002; de Simone 2004, 85–93.

98 Some opinions on the question are discussed in Giuffrida Ientile 1983, 9–11. Bader 2003 deduces the appellations from Indo-European *trh₂*-, “to cross,” but her argument is wildly speculative.

99 A number of sources for the names of the Etruscans and their country, together with some further etymological speculation, are cited in Buonamici 1939, 1–2, 140–43; on the ancient etymologies, see also Drews 1992, 36–37.

100 West 1966 prints the passage in question, where the *Τυρσηνοί* are called subjects of Agrius and Latinus and said to live “in the recess of holy islands,” as genuine but dates it significantly later than the rest of the text, namely to the middle of the sixth century B.C.E., in his introduction and commentary (40–48, 435–36). See also Horsfall 1973, 78; Barker and Rasmussen 1998, 84.

- 101** Horsfall 1973, 78. Dionysius (*Ant. Rom.* 1.25.5) attests that Italy as a whole was still called *Τυρρηνία* in the fifth century BCE.
- 102** Cf. Giuffrida Lentile 1983, 33–47.
- 103** On the ancient tradition about the Etruscans as Pelasgians, see Briquel 1984 and the brief but illuminating remarks in Musti 1989, 34–36. Some instances are cited below in part 2.
- 104** On the gradual clarification of an originally vague concept, see Musti 1989, 30.
- 105** See, e.g., Giuffrida Lentile 1983, 9–32. For some examples, see below, part 2.
- 106** Cf. Mansuelli 1984, 355.
- 107** See [chapter 2](#) Ulf.
- 108** But see also Thuc. 4.109, where Etruscans, identified with Pelasgians, are located on Lemnos, in Athens and on Mount Athos (cf. Giuffrida Lentile 1983, 17–19).
- 109** Cf. Giuffrida Lentile 1983, 51–54.
- 110** As Amann 1999 shows, he is more interested in a colorful “Herodotean” portrait of a barbarian ethnos than, as often assumed, in exposing the negative effects of *τροπή*.
- 111** On the whole complex “Etruscans / Pelasgians / Athens,” see Briquel 1984, 283–95.
- 112** For the interpretation of Lycophron’s cryptic text, see the new edition by Hurst and Kolde 2008. The respective scholia can be interesting, too.
- 113** Felix Jacoby later changed his mind and attributed the piece to Timaeus (*FGrH* 566 F 1), but his view did not gain general acceptance. On Posidonius and the Etruscans, see Heurgon 1962.
- 114** Firpo 1997.
- 115** On the Dionysian tradition of Etruscan autochthony, see, e.g., Linderski 1992 and Briquel 1993, on the much-discussed controversy between Herodotus and Dionysius Scullard 1966 and Drews 1992, 31–33.
- 116** Cf., e.g., Bloch 1967; for an interesting episode, Firpo 1998, 251–56.
- 117** On Varro and Etruscan divination, see Capdeville 1998, 395–97.
- 118** On part of Strabo’s overview, see Musti 1989, 19–25.
- 119** Cf., e.g., Pease 1963; Guillaumont 2006.
- 120** On the orientation of religious buildings in Vitruvius, see Chevallier 1993.
- 121** Cf. Firpo 1998. For remarks on divination, see Guittard and Briquel 1991; Macfarlane 1996.
- 122** Horsfall 1973; Pallottino 1985; Wilhelm 1992.
- 123** Felix Jacoby seems to think that this name is made up (cf. his commentary on *FGrH* 22–23), but he does not explain his reasons.
- 124** See Maras 2010; against attribution to the *Τυρρηνικά*, Briquel 1995a, 91. How well-informed Claudius probably was has been underlined by Heurgon 1953. His predecessor and nephew Caligula apparently was an Etruscophile, too (Bonfante 1990).
- 125** Cf. Briquel 1995a, 89–91. On Tacitus and haruspicy in general, Briquel 1995.
- 126** Whether this is anticipated by Cicero (*Div.* 1.92) is disputed and depends on the text of the latter.
- 127** On their view of Etruscan divination, see the relevant items in Briquel and Guittard 1995.
- 128** Guillaumont 1995 (who also treats the extispicy scene in Sen. *Oed.* 291–402); Capdeville 1998, 403–09.
- 129** Tassi Scandone 2009.
- 130** See, e.g., Heurgon 1959, Santini 2002 and the [chapter 37](#) Marcone in this volume.
- 131** See, e.g., Capdeville 1998, 409–13; Cotta Ramosino 2003.
- 132** Cf. Champeaux 1996.
- 133** Grandazzi 1993.
- 134** Freyburger 1999.
- 135** Champeaux 1999.
- 136** Berger 2005.
- 137** Guittard 1994.
- 138** Weinstock 1946.

- 139** Domenici and Maderna 2007, 20–27, 40–41 n. 34.
- 140** Domenici and Maderna 2007. For further bibliography on the brontoscopic calendar, the most famous piece, see there 43 n. 62, 149 n. 101; cf. also MacIntosh Turfa 2006. On John and the Etruscans in general, Briquel 1991, 489–554.
- 141** Maras and Michetti 2011.
- 142** *Lanista* and *cassis* could really be of Etruscan origin, *veles* is not (Briquel 1991, 355–59).
- 143** De Grummond 2006, 202.
- 144** The late antique scholia seem to have it the other way around (Athenian woman, Etruscan prisoner), but their text is corrupt and the version of Eustathius appears more plausible.
- 145** Cf., e.g., Barker and Rasmussen 1998, 92–93. However, most of these writings may have been quite late (first century BCE?). For part of a *liber tonitruialis*, preserved in John the Lydian, see above, part 2.
- 146** Cf. the *Tuscae historiae* cited, through Varro, in Censorinus, *De die natali* 17.6, whose account was organized according to the doctrine of the *saecula*; in general, Barker and Rasmussen 1998, 111–16. – Whether the *tragoediae Tuscae* of a Volnius mentioned by Varro (*Ling.* 5.55) were tragedies in Etruscan, as commonly supposed, or just about Etruscan subjects, we do not know.
- 147** Cf. Horsfall 1973, 79 n. 99 and Capdeville 1998, 395–97, with older literature; on Labeo, Briquel 1998.
- 148** Rallo 1989, esp. 26–33.
- 149** On differences between the Greek and the Roman perspective, see Musti 1989, 36–39.
- 150** On Etruscan piracy, see Giuffrida Ientile 1983; later, e.g., Musti 1989, 28–34 (also on its complex relationship to Etruscan thalassocracy); Firpo 1997, 108 n. 22 with further literature.

- 151** See, e.g., Mansuelli 1984. This could owe something to the fact that the putative ancestors of the Etruscans, the Lydians, were also seen as paragons of refinement and *savoir vivre*, as is clear, for example, from Sappho.
- 152** Cf., e.g., Bloch 1967. Bittarello 2009 one-sidedly emphasizes Roman hostility against the Etruscans at the expense of interest and sympathy.
- 153** Cf., e.g., Musti 1989, 22 n. 8 with older literature; add the list in Flor. 1.5.6.
- 154** Briquel 1990.
- 155** For a number of sources and secondary literature, see, e.g., Firpo 1997, 105 n. 10.
- 156** Musti 1989, 36.
- 157** Piracy could however also be seen as a symptom of decadence (Strabo 5.2.2). Its relationship to the τρῳή topos to be mentioned presently is well explained in Musti 1989.
- 158** A number of relevant articles can be found in Briquel and Guittard 1999.
- 159** Cf. West 1984.
- 160** See Musti 1989, 22 n. 8 with sources and further literature.
- 161** See, e.g., Prayon 1996, 14.
- 162** For example, the story of the emigration of Demaratus from Corinth to Tarquinia illustrates and specifies the archeological picture of intense Greek influence on Etruscan culture during the Archaic period (Blakeway 1935, esp. 147–49; Ridgway and Ridgway 1994).
- 163** For the primacy of the literary sources regarding the topic of piracy, see Giuffrida Lentila 1983, 4.
- 164** Barker and Rasmussen 1998, 91.
- 165** Bonucci Caporali 1981; Pallottino 1984a, 10; Cristofani 1992, 4–5; Camporeale 2011, 18–19.
- 166** Camporeale 2011, 18–19.
- 167** Cipriani 1980; Camporeale 2011, 16.
- 168** Cipriani 1980; Camporeale 2011, 17.

- 217** Harari 2000a, 30–31; 2012a, 35.
- 218** In Arezzo, Chiusi, Cortona, Florence, etc.; one may name, among a number of catalogues, Colonna 1985 and Cristofani 1985. On Etruscan exhibitions in the second half of the twentieth century, see Harari 2012a.
- 219** Cristofani 1978; Torelli 1985.
- 220** Massa-Pairault 1985, xiii–xvii; 1992, 7–14.
- 221** Brendel 1995 (with updated bibliography), originally published in 1978.
- 222** Principi 2000. See [chapter 45](#) Menichetti.
- 223** Colonna 2000. See [chapter 51](#) Spivey and Harari.
- 224** Harari 2014.
- 225** Massa-Pairault 1985.
- 226** Domenici 2009; de Angelis 2015.
- 227** Summary of Etruscan wall-painting scholarship in Arias 1989, followed up for the next decade by Rouveret 2000–2001.
- 228** For a recent presentation of the non-funerary orientation of the Etruscan iconography on vase painting, see Bonaudo 1999.
- 229** See the web site *Iconographie et Archéologie pour l'Italie préromaine* (ICAR): <http://icar.huma-num.fr/icar/sdb/support.php?idsupport=TARQ69> and Martelli 1987, 327.
- 230** Gerhard 1831, p. 111. Gerhard founded the German archaeological association the *Hyperboreans*, which became, with the addition of foreign antiquarians, the *Istituto di Corrispondenza Archeologica*.
- 231** Gerhard 1843–67.
- 232** Brunn and Körte 1870–96.
- 233** Beazley 1947, to be completed by the *CVA*.
- 234** Raoul-Rochette 1834.
- 235** Steingraber 1984. See also a digital catalogue on the web: *ICAR, une base de données des scènes figurées de l'Italie pré-romaine*: <http://icar.huma-num.fr/>, directed by N. Lubtchansky.
- 236** Kestner 1829.
- 237** Raoul-Rochette 1828.
- 238** See also Arias 1989.
- 239** Martha 1889.
- 240** Weege 1921.
- 241** Poulsen 1922; Van Essen 1927.
- 242** Beazley 1947.
- 243** Messerschmidt 1926; Ducati 1937; Bianchi Bandinelli 1939; Pallottino 1952; Banti 1955–56 and Camporeale 1968.

244 Paribeni 1938; Paribeni 1939; supplemented by Jannot 1984.

245 Ducati 1911. For studies of the iconography, see the review of the literature by Sassatelli and Govi 2007.

246 Ducati 1932; supplemented by Hannestad 1974. On black-figure workshops, see also Gaultier 1995 and Spivey 1987.

247 Pallottino 1952.

248 Beazley 1947, 8.

249 Hampe and Simon 1964. For reaction to this thesis, see Camporeale 1969. See also Simon 1973 for wall-paintings.

250 For the Etruscans, Cristofani 1976. For a more methodological approach, Rouveret and Gruzinski 1976.

- 251** Cristofani 1978.
- 252** The studies date from 1980s. They are reprinted in d'Agostino and Cerchiai 1999.
- 253** See d'Agostino and Cerchiai 1999, 13–30.
- 254** Lubtchansky 2005. For the same analysis of the iconography of women: Lubtchansky 2006.
- 255** See d'Agostino and Cerchiai 1999, 32 (but corrigendum, xxiii). But Cerchiai, who is close to d'Agostino in this social reading of the images, also studies some scenes that already in the Archaic period depict the underworld: Cerchiai 2008.
- 256** For a methodological example of this line of study: Bérard 1983. This approach has been first used by Angela Pontrandolfo and Agnès Rouveret for Paestan paintings: Greco Pontrandolfo and Rouveret 1982.
- 257** Cerchiai applies the same view to Felsinian stela. See the discussion in Cerchiai 2012 and Sassatelli and Govi 2007. For Caeretan *hydriai*, see Bonaudo 1999.
- 258** See d'Agostino and Cerchiai 1999, 13–30.
- 259** On the interpretation of doors: Naso 1996, 420.
- 260** See d'Agostino and Cerchiai 1999, XIX.
- 261** Cerchiai and d'Agostino 2004.
- 262** Among more recent publications: for urns, van der Meer 2004 de Angelis 2015; for mirrors, deAngelis 2002; for engraved scarabs, Krauskopf 1999.
- 263** Maggiani 1985, 208–12. This iconographic trend is to be connected to a major expansion of genealogical legends that developed in various Etruscan sites of the Classical and Hellenistic periods concerning the offspring of various Greek heroes in Italy. See Briquel 1984.
- 264** Martelli (ed.) 1987, 327.
- 265** ICAR: <http://icar.huma-num.fr/icar/support.php?idsupport=TARQ17>.
- 266** Roncalli 1997. See also Rouveret 2000–2001.
- 267** Cristofani 1989.
- 268** See Rouveret 2000–2001 and Lubtchansky 2014.
- 269** Arnobius and Servius are both of the fourth century CE. See Roncalli 1990, and most recently Camporeale 2009; Warden 2009.
- 270** For instance, Rendeli 1996, Bonamici 2005, Sassatelli and Govi 2007.
- 271** See Cèbeillac-Gervasoni 1989, for the differences of opinion between N. Spivey and J. Heurgon, and more recently Sassatelli and Govi 2007, Cerchiai 2012, for the opposition between L. Cerchiai and G. Sassatelli. See also Serra Ridgway 2006.
- 272** In general, see Bonamici 2005. For Dionysus, see Massa-Pairault 1998, Krauskopf 2005 and Cerchiai 2008; for the Dioscuri, Roncalli 1990, Colonna 1996; for Turms, Bonamici 2005; for Orpheus, Ambrosini 1998.
- 273** Rouveret 1988.
- 274** Torelli 1997, 122–51.
- 275** See also Lubtchansky 2014.
- 276** Gilotta 1996.
- 277** Lambrechts 1963.
- 278** About the story of the more or less fantastic “decipherments” of Etruscan alphabets until Lanzi see Buonamici 1932, 17–45.
- 279** Müller 1828.
- 280** See Corssen 1874.
- 281** See Deecke 1875.
- 282** Wikander and Wikander 2003, 22; 16–27 for the history of the main stages of the *CIE*, only briefly summarized here. This work is useful, although sometimes disturbingly acrimonious, for the authors seem to suggest something like a “plot” (by whom, is not clear) against recognizing Danielsson’s role.
- 283** See Lattes 1904.
- 284** About the *liber linteus Zagrabienensis* see now Belfiore 2010 (15–25, the story of its

discovery).

285 The new plan of the work is to be found on the inside front cover of fascicle II.1.1 (1907).

286 Buonamici called his monumental handbook *Epigrafia etrusca* (Buonamici 1932), avoiding any reference to language in the title. In fact he stated: “L’epigrafia può fare a meno dell’ermeneutica, ma, per l’Etrusco, l’ermeneutica non può fare a meno dell’epigrafia... La ricerca epigrafica... è il primo gradino, l’ABC di ogni tentativo ermeneutico che *seriamente* si voglia intraprendere intorno all’Etrusco” (Buonamici 1932, 427). This is undeniably true, but several decades needed to pass before it reached widespread acceptance.

287 See Rosenberg 1913; Cortsen 1925.

288 This phase of the research, as the immediately preceding one, is summarized especially by Pallottino 1984, 412 ff., and Rix 1963b.

289 See Rix 1963a.

290 Rix 1963b.

291 Wikander and Wikander 2003.

292 Reports are published in *Studi Etruschi* 14, 1940, 451–53; 15, 1941, 401; 17, 1943, 556–57.

293 See Cristofani 1965.

294 Developments of this period are especially summarized in Olzscha 1969; 1970; Pallottino 1969.

295 Literature about this period is not quoted here, because it largely coincides with what is referred to in [chapter 17](#).

296 An online update of the *ET* has been attempted (the *Etruscan Texts Project*), but the website was shut down after some years. The second edition has been published in 2014 (*ET*²).

297 See de Simone 2010.

298 Rix 1983.

299 Agostiniani 2003. In *ET*² Meiser has abandoned Rix’s reconstruction and has converted to Agostiniani’s one; he has also introduced a new system of interpretive transcription, which does not solve the ground issues raised by Rix’s one.

300 See [chapter 2](#) Ulf.

- 566** Steingraber 1984, 314–15 pls. 79–83.
- 567** On its existence see Harris 1971, 4–31; Sordi 1989. Unfortunately the twenty books of the emperor Claudius's *Tyrrhenica* (Suet. *Claud.* 42.2) have not survived.
- 568** The *Editio minor* Rix 1991 has been updated by Meiser 2014 (= *ET*²).
- 569** For the New Archaeology and the critical discussion surrounding it see inter alia Binford 1971; O'Shea 1984. For Italy: d'Agostino 1985; most recently Izzet 2007.
- 570** Recent research has attempted to fill these gaps. See most recently Bentz and Reusser 2010a and on Marzabotto in particular, Sassatelli and Govi 2010.
- 571** Bachofen 1870. See Amann 2000, 13–19 (with older literature).
- 572** Most recently Aigner-Foresti 2005 (with older literature).
- 573** di Gennaro and Guidi 2000, 114; Sestieri 2010, 236–39.
- 574** Negroni Catacchio 1995; Sestieri 2010, 234.
- 575** Bartoloni 2002, 127–29.
- 576** So Colonna 1986, 390.
- 577** On the manufacture of pottery, see Boitani, Neri and Biagi 2007–8.
- 578** For Tarquinia see Iaia 1995, 250–51. The use of hut-urns is not uniform in Etruria, but in any case it emphasizes the high social status of the one buried in it: Bartoloni *et alii* 1987, 223–24.
- 579** Cf. e.g. Torelli and Cristofani 1995, 108–9; Iaia 1999, esp. 122.
- 580** Pacciarelli 2001, 247 (Tarquinia, Le Rose), 256.
- 581** Damgaard Andersen 1993. See also Babbi 2008.
- 582** Various proposals have been made concerning the origin and period of appearance of the *nomen gentile*. See Rix 1972; Colonna 1977. Overview in Marchesini 1997, 154–62.
- 583** There are also *gentilicia* based on ethnic and individual names. See Rix 1977, 66–67. On the group of the supposed “Vornamengentilizia” see Benelli 2002; 2011.
- 584** Amann 2006, 9; Franciosi 1988.
- 585** The large number of *gentilicia* in early times speaks against an original limitation to the upper class, as seen already by Pallottino (1988, 287–88).
- 586** Ricci 1955, 233ff.; Gran Aymerich 1979, esp. 601–36.
- 587** E.g. Tarquinia: Mercareccia Tomb; Cerveteri: Tomb of the Reliefs; Vulci: François Tomb; Perugia: Tomb of the Cai Cutu; Volterra: Inghirami Tomb; rock facade tombs in Norchia and Castel D'Asso.
- 588** *ET*² Pe 8.4, A 2 f.; Pe 5.2 (San Manno); Ta 5.6 (Tomb of the Typhon). This word probably comes from the Indo-European root **h¹leud^h*. Most recently Rix 1994, 111–12. Perhaps it especially emphasizes one's freeborn status.
- 589** *ET*² AT 1.30; 1.138, 140, 141, 148 (cf. for Sovana AV 1.13).
- 590** On house and family see in general Camporeale 1986.
- 591** In this sense Rix 1972; *contra* Colonna 1977, 181. The problem has not yet received a

widely accepted solution.

592 A few examples of individual *cognomina* come from the Archaic period (probably not inherited): Rix 1963, 380.

593 On the few Etruscan civil law texts, see Facchetti 2000 (including some highly hypothetical suggestions). On the Tabula Cortonensis, see Agostiniani and Nicosia 2000.

594 The terms for “uncle” and “aunt” would be interesting, for example.

595 Amann 2006. On kinship terminology in the Indo-European languages, see the still fundamental work of Benveniste 1969.

596 On the female spheres of life in general see Rallo 1989; Amann 2000 (with older literature). For an overview and for the much-discussed passage by Theopompus (apud Ath. 12.517d–518b) cf. chapters 53 Amann and 59 Amann.

597 Guidi 1993; Pacciarelli 2001, 261–76. In general: Bartoloni 2003.

598 On the throne of Verucchio, whose incised decoration depicts several stages of wool production, see von Eles 2002.

599 See inter alia most recently Principi 2000; Celuzza and Cianferoni 2010.

600 On this development see d’Agostino 1990.

- 601** On urbanization, see most recently Izzet 2007, 165–207; Bruni 2010; especially Riva 2010.
- 602** On agriculture, handicrafts, and commerce, see in general Cristofani 1986.
- 603** Colonna 1986. On the necropolis of Orvieto, see most recently Feruglio 2003, esp. 280–305.
- 604** On the various forms of integration of foreigners, see chapters 53 Amann and 59 Amann.
- 605** The Latin word *satelles* “companion, retinue, satellite” is usually considered to be of Etruscan origin (*satlaθ*) (cf. *sodalis*): Breyer 1993, 299–300. On military service by the lower classes cf. Dion. Hal. *Ant. Rom.* 9.5.4 and Livy 9.36.
- 606** Bentz and Reusser 2008, 84–87; Bentz and Reusser 2010b, 110; Prayon 2010, 21–23. On the Casa dell’Impluvium in Roselle, see [chapter 53](#) Amann.
- 607** See Torelli 1990.
- 608** Illustrative in this regard is the tomb epigram of Larthi Cilnei from Tarquinia, for which see [chapter 59](#) Amann.
- 609** Diod. Sic. 5.40. Cf. also Catull. 39.40 (*obesus Etruscus*); Verg. *G.* 2.193 (*pinguis Tyrrhenus*).
- 610** The approximately equally large *insulae* contained houses of different dimensions, those of the upper class (e.g. *insula* IV 1) and those of the broader middle class: Bentz and Reusser 2008, 87–88; Bentz and Reusser 2010b, 110. On House IV 2, 1, see Sassatelli and Govi 2010.
- 611** The few indications of the existence of a sort of “senate” (e.g. in Arezzo for 208 BCE) reveal a few *principes senatus* alongside a larger number of senators (Livy 27.24.4).
- 612** *ET*² Cr 4.4 and 4.5; Pallottino 1988, 177; Torelli 1981, 200–203; Colonna 2007 (dealing with the interesting Tomba delle Iscrizioni Graffite).
- 613** See Colonna 1990, 15–16.
- 614** The meaning of the word “*penestai*,” used only once by Dion. Hal. *Ant. Rom.* 9.5.4, was greatly exaggerated in the older literature (e.g. Heurgon 1957; 1970; Mazzarino 1957). See the criticism by Benelli 1996 and [chapter 59](#) Amann.
- 615** In this context, the Tabula Cortonensis is relevant. See [chapter 59](#) Amann.
- 616** Torelli 1981, 218.
- 617** With a revolt of the *plebs* we deal in the case of Arezzo in 302 BCE (Livy 10.5.13). For discussion, see Harris 1971, 114–24; Torelli 1987, 87–95; Benelli 1996; Massa-Pairault 2000; and chapters 59 Amann and 65 Marcone.
- 618** On the interesting Late Archaic inscription of the *lauteniθa* Kanuta from the Campo della Fiera sanctuary near Orvieto, see Stopponi 2009, 441–49. The Etruscan word for “slave” is not known; on slavery, see chapters 53 Amann and 59 Amann.
- 619** *Gromatici veteres*, pp. 348–50 Lachmann. Harris 1971, 31–40; Valvo 1988 (with older literature).
- 620** This is rightly suggested by Nielsen 1989, 85 for northern Etruria.
- 621** On this important recent discovery from the late third – early second century BCE, see Agostiniani and Nicosia 2000; Pandolfini and Maggiani 2002.
- 622** On the *lautni* inscriptions see Rix 1963, 356–72; cfr. also Rix 1994. On votive gifts by freedmen see Maras 2009, 210–11. The Etruscan *lautni* was free as to his person, but full citizenship was achieved only by his children, see chapters 59 Amann and 65 Marcone.
- 623** Rix 1977; important critique by Benelli 2002; 2011. For discussion of the phenomenon see [chapter 59](#) Amann.
- 624** Dietler 1995; 2001.
- 625** Rathje 2010, 25.
- 626** Iaia 2010; De Santis 2005; Marzoli 1989.
- 627** Amann 2010, 31; Riva 2006, 120–125; see also [chapter 42](#) Trocchi.
- 628** Damgaard Andersen 1998, 16–20; see also [chapter 39](#) Karlsson.
- 629** Kistler 2011.
- 630** Riva 2006, 120–125; Iaia 1999, 96–114.

- 783** Colonna 2005.
- 784** In the Euboean sphere (including its colonies), at least two alternative series are known with respect to the bound couple *gamma/pi*: the preferred alternative is the hooked *gamma* and the three-stroke *pi* (Jeffery 1990, 79–89, 235–48; Bartoněk and Buchner 1995), but there were also a lunate *gamma* with two-stroke *pi* (which then became the form that passed into the Etruscan alphabet, as is now documented by an abecetary with a *samekh*-shaped *xi*, as opposed to the usual cruciform *xi*: Kenzelmann Pfyffer, Theurillat and Verdan 2006, 60 n. 3). In the Attic sphere there were at least three different series: alongside the dominant one and the already-known script of the “Dipylon oinochoe” (Jeffery 1990, 66–78) we now have a third alphabetic series that differs yet again (Langdon 2005).
- 785** Especially to be included here are the *sigla* (and perhaps brief inscriptions) on bronze objects from the San Francesco hoard in Bologna, some of which may date as early as the close of the eighth century (Sassatelli 1981–82).
- 786** Benelli 2013.

787 See chapters 45–50.

788 Panciera 1998, 314.

789 The history of the Etruscan abecedaries and the periodization of their development are fully discussed in Pandolfini and Prosdocimi 1990. An update on the known abecedaries may be found in the list in *ThLE* I2; see also *REE* 73: 7, 70, 118; *REE* 74: 9.

790 Cf. n. 2 above.

791 The history of the sibilant letters at Caere is summarized in de Simone 1994. See now Benelli 2016.

792 See chapter 7 Benelli at nos. 26–27.

793 On the use of syllabic punctuation Rix 1968 is still valid.

794 The best overall treatment of the Etruscan language is Rix 2004, which is followed here to a great extent. Also useful is Wallace 2008. For specific bibliography refer to these works, indicating at this point only the principal contributions on which our present knowledge of the language has been constructed: de Simone 1970, 1990, 1996; Rix 1981, 1983, 1984, 1997; Agostiniani 1984, 1985, 1992, 1997a, 1997b; Adiego 2006, 2009; van Heems 2009a. See also the critical editions of the principal long texts: Cristofani 1995; Agostiniani and Nicosia 2000; Rix 2000; Maggiani 2001a; de Simone 2001–2, 2002, 2003; Roma 2002; Belfiore 2010.

795 When the Etruscan language is discussed in a general sense, the convention is that forms are always cited using southern Etruscan orthography; the reason lies in the uncertainty of the reading of the letter ⟨s⟩ in the northern area, as described above. Using southern orthography, ⟨s⟩ always denotes /s/ and ⟨ś⟩ always denotes /σ/, with no possibility of confusion.

796 The best explanation of the appearance of this i- is now found in Adiego 2011; notwithstanding the indisputable overall value of this work, the lack of acknowledgment of the feminine genitives in *eal* and the probably erroneous segmentation of *CIE* 10001 (= *ET* Ta 2.5) must be noted.

797 To avoid misunderstanding it is appropriate to note that the zero-case plural form *-śva cited in some manuals is not securely documented; the three examples usually cited can all be analyzed, with great probability if not absolute certainty, as inanimate plurals in -va of stems in -ś.

798 On Etruscan onomastics in general see Rix 1963, 1972, 1994; Colonna 1977; Benelli 2002, 2011.

799 In Etruscan epigraphy, a *filiation* is the father's name in the genitive, while a *patronymic* is an adjectival form of the father's name.

800 Most recently van Heems 2008, with previous literature.

- 801** An attempt to map the phenomenon is found in Maggiani 2007b.
- 802** Most recently Govi 2006 (to be used with caution), with previous literature.
- 803** Morandi Tarabella 2004, 179–96.
- 804** On this phenomenon Maggiani 2000.
- 805** Rix 1998. See now Marchesini 2015.
- 806** On Lemnian most recently de Simone 2009. On the inscriptions from Samothrace Brixhe 2006.
- 807** Benelli 2005.
- 808** Maras and Sciacca 2011.
- 809** History of writing in the Archaic period (as a whole, from the seventh century to the fifth): see especially Cristofani 1972, 1978 (general articles); Colonna 1970 (Caere); Colonna and Gambari 1986 (Tiber and northern areas); Gervasini and Maggiani 1996 (northern area); Benelli 2000 (Chiusi); Maggiani 2003 (Orvieto); Harari 2008 (Adria); Pellegrino 2008 (Salerno area). Also useful are the script charts in Bagnasco Gianni 1996.
- 810** In general on Veian writing see Maras 2009b.
- 811** The only group that exhibits a degree of regularity is the northern Etruscan stelae, on which see Ciacci 2004 and Maggiani 2007a.
- 812** Van Heems 2009b; the archaeological data on the necropolises are completed at least with Forte 1988–89 and Feruglio 2003.
- 813** On funerary epigraphy see the systematic treatment in Benelli 2007, 40–176. Epigraphy of the Recent period and society: after the pioneering work of Cristofani 1969–70 (Tarquinia), see, among the more recent, Maggiani 2009, Benelli 2009a, 2009b, all concentrated on northern Etruscan documentation.
- 814** On sacred inscriptions most recently Maras 2009a, keeping in mind that the completeness and reliability of epigraphic indexing are very uneven, varying between excellent and shoddy.
- 815** History of Recent period Etruscan writing: fundamental is the formulation of the problem in Maggiani 1990, with previous literature; in general: Benelli 2012. On <ê>: Agostiniani and Nicosia 2000, 47–52; see also Eichner 2006 for a list of attestations (to which should be added *CIE* 2009).
- 816** There is no complete study of Etruscan public inscriptions; on institutional vocabulary see especially Colonna 1988 and Maggiani 2001b.
- 817** In the four years following the writing of this chapter the overall knowledge about Etruscan language and epigraphy has changed in some aspects. For an overview on recent literature see Benelli 2015, v–ix.17
- I would like to express my thanks to Michael H. Crawford and Giovanni Colonna for their comments on and invaluable help with this chapter. Of course, only the author can be held responsible for the views expressed as well as for any remaining errors.

I would like to extend my warmest thanks to Colin Clement for his work in translating this article.

1152 Cristofani 1983; 1984; Gras 1985; Braudel 1998, 230–43; Briquel 1999, 83–104

1153 On piracy: Gras 1976; 1977; Giuffrida Ientile 1983; on inventions: Rebuffat 1977.

1154 On wrecks: Höckmann 2001, 293–295; Long et al. 2002; on trade and distribution of goods: Morel 1981; *Commercio etrusco arcaico* 1985; Gras 1985; 2000a; *Etruschi da Genova ad Ampurias* 2006.

1155 Among the relatively abundant bibliography on Etruscan shipping, see essentially: Basch 1987, 398–410; Bonino 1989; 1995; De Vries 1972; Hagy 1986, 221–250; Höckmann 2000; 2001; Jannot 1995; Paglieri 1960; Pomey 2002a; 2006.

1156 For example, we know nothing about the ships used during the battles of Alalia (Hdt. 1.166–167) or Cumes (Diod. Sic. 11.51). For an analysis of all these texts, cf. Jannot 1995; see also Gras 2000b.

1157 The references cited above in note 4 are essentially based upon iconography. We shall not consider the well-known pyxide of Caere in the Louvre (D 150), representing a naval combat between a duck-shaped ship and a fish-shaped ship, which has clearly been repainted, cf. Geppert and Gaultier 2000a, 2000b.

1158 Hagy 1986; Basch 1987, 401–404; Höckmann 2001.

1159 One can see on the small craft of the Tomba della Caccia e Pesca at Tarquinia (end of 6th century BCE) an inverted stempost with protruding keel and cutwater that are of the same tradition. (Colour plates 22–23).

1160 Hagy 1986; Basch 1987, 401–404; Jannot 1995.

1161 Hagy 1986, Fig. 13; Basch 1987, Fig. 866.

1162 L. Basch (1987, 407) remarks quite rightly that, according to Caesar (*B. Afr.* 44.3), during the Alexandrian wars, the Romans equipped *actuariæ*, that is merchant ships of mixed propulsion, with rams to make up for the lack of warships.

1163 One is on the Museum of Art and Archaeology of the University of Missouri and the other on the National Maritime Museum of Haifa. Cf. Biers and Humphreys 1977.

1164 Certain ships seem to have a rudder both fore and aft, while on others there is no mast although the sails are spread.

1165 This mast has no sail. It is possible that it was removed for combat. It is also possible that the artist did not paint the sail so that the combatants could be more easily seen

1166 Examples of such stemposts are plentiful, cf. p. ex. Basch 1987, figs. 296, 483 and 536.

1167 For example, on a *bucchero* ship from Artimino (seventh century) and a plate from Tarquinia (c.580–560) (Höckmann 2001, figs. 7 and 14). One can compare this stempost with that of the terracotta model from Amathus in the Metropolitan Museum, New York (Basch 1987, Fig. 536; Pomey 1997, 77).

1168 Paglieri considers the mixed ship as being the characteristic of the Etrusco-Italic ship (Paglieri 1960).

1169 It is possible to juxtapose this ship with those depicted on an amphora from Caere (Höckmann 2001, pl. 15, figs. 3 and 4).

1170 The double lines featured on the hulls depicted on the vase from Caere are more likely to be the

1171 Höckmann 2001, figs. 30–58 and pl. 16–20.

1172 Morrison and Williams 1968, 112 and pl. 22b; Basch 1987, Fig. 879; Höckmann 2001, Fig. 21.

1173 Morrison and Williams 1968; Casson 1971, 43–76; Basch 1987, 202–247.

1174 Moretti 1961; Casson 1971, Fig. 97; Bonghi Jovino 1986, 267–269, Fig. 257; Basch 1987, Fig. 880; Höckmann, 2001, Fig. 22.

1175 Morrison and Williams 1968, 109 and pl. 19; Casson 1971, Fig. 81–82; Basch 1987, Fig. 461–464; Pomey 1997a, 79; Höckmann, 2001, Fig. 22a.

1176 A war galley, represented on a fragment of a Corinthian krater from around 560 BCE,

shows for the first time a second mast set to the front of the vessel (Casson 1980). The ship of the Tomba della Nave (Tomb of the Ship) at Tarquinia is, however, the first known merchant ship rigged with two masts.

1177 Paglieri (1960, 231) considers the Tomba della Nave ship as a foreign vessel come from afar.

1178 Cf. *supra* note 3.

1179 Pomey 2002a; 2006.

1180 Cibecchini 2006, 535–536. The deep-lying wreck has only been the object of limited lifting of elements but the samples gathered clearly correspond to a homogenous load of Etruscan origin. On the other hand, we shall not consider the presumed wrecks of *Cala Galbugina* of Isola del Giglio, *Isola dello Sparviero* and of *Secche della Meloria*, all from end of the sixth to the beginning of the fifth century BCE, since the sampling has not been sufficient to judge the homogeneity and importance (Cibecchini 2006, 536–537).

1181 Long and Sourisseau 2002, 25–31. Long et al. 2002 contains an updated bibliography of the wrecks along the French coast of southern Gaul, which have been reconsidered.

1182 Hesnard 2002, 25–31. The wreck has unfortunately been plundered and its true size is unknown. Its cargo most probably exceeded 100 amphorae.

1183 Long et al. 2006.

1184 The small lead anchor stock found on the site probably does not belong to the wreck (Gianfrotta and Pomey 1981, 305). The dimensions of the ship correspond with those of the Greek ship *Jules-Verne 7* (end of the sixth century BCE) (Pomey 2003) and with *Pointe Lequin 1A* (Long and Sourisseau 2002b).

1185 Long et al. 2006; Pomey 2006, 433.

1186 Cristofani 1996. According to G. Colonna (2006, 658–662) the ship would be quite Etruscan and not Greek.

1187 The length of the ship can be estimated at around twenty-five meters from the sampling of hull fragments that were recovered (Pomey 2008, 61).

1188 Pomey 2002b.

1189 Long and Sourisseau 2002c, d.

1190 Bound 1985; 1991.

1191 Pomey 1981.

1192 Pomey 1999; 2001a; 2002c.

1193 Pomey 2000; 2003.

1194 The discovery of the Archaic Greek wreck of Pabuç Burnu, near Halicarnassus, has confirmed this hypothesis (Polzer 2010).

1195 On this naval construction tradition and its evolution, cf. Pomey 1997b; 2010; Kahanov and Pomey 2004. We shall not follow MacIntosh Turfa and Steinmayer 2001 who, disregarding the Greek wrecks of Place Jules-Verne in Marseilles, consider the Giglio and Bon Porté 1 as Etruscan boats and that the Greeks never knew the sewn assembly technique.

1196 Morel 2006, 33.

1197 Pomey 2006, 427–433.

1198 Long et alii 2006, 470–482.

- 1246** de Marinis and Rapi 2007.
- 1247** Emiliozzi 1991, 1992, 1996 a, 1996b. Finds of Etruscan and Italic vehicles were listed previously by Nachod 1909, 43–71; Woytowitsch 1978; Stary 1980. Discussions appeared in Stary 1981; Höckmann 1982; Bartoloni and Grottanelli 1984; Galeotti 1986–88.

1248 Emiliozzi 1997, which includes an updated list of vehicles from the Italian Peninsula (Camerin and Emiliozzi 1997).

1249 They come from Pontecagnano, Veii, Caere, Tarquinii, Vulci, Rusellae, Vetulonia, Casale Marittimo, Castellina in Chianti, and Verucchio.

1250 Previously, the remains of four wheels in a tomb had led some authors to record the presence of a four-wheeled vehicle or two chariots.

1251 Among the Etruscan occurrences may be mentioned Camerin and Emiliozzi 1997, nos. 132–133 (Tarquinii), 116–17 (Marsiliana d'Albegna), 173–74 (Vetulonia), 94 (Casale Marittimo, see also Emiliozzi 2001), 98 (Castellina in Chianti, see also Emiliozzi 1999), 227–228 (Verucchio).

1252 Emiliozzi 1997, 163–168, figs. 4–5, pl. VI (Populonia); 2011, figs. II.1, II.10 (Castro); Emiliozzi 1997, 210–13, figs. 1, 5 (Castel San Mariano). The earliest example that has been graphically reconstructed comes from Latium vetus, Tomb 15 of Castel di Decima, dating 720–710 (Emiliozzi 1997, 96, Figure 1; Camerin and Emiliozzi 1997, no. 19). It is noteworthy that thus far nine “Version A” chariots have been reconstructed, either physically or in images (see Emiliozzi 2011, n. II.15).

1253 Emiliozzi 1992, 102, fig 21; 1997, 97, Figure 2; Camerin and Emiliozzi 1997, no. 25 (with bibliography).

1254 Emiliozzi 1997, 201–202, fig. 197. There is also the contemporaneous depiction on the left side panel of the chariot from Monteleone di Spoleto, probably made in southern Etruria (Emiliozzi 2011, Figure I.25).

1255 Camerin and Emiliozzi 1997, no. 103, with bibliography. In 2013 this chariot has been reconstructed both in image and physically: Emiliozzi and Sannibale 2013, 38.

1256 One more example of version A come from Capua (Emiliozzi 2006), while the war chariot from the Barberini Tomb at Praeneste represents version B (see bibliography in footnote 7 above).

1257 Examples are Winter 2009, nos. 5.D.2.a,c, 5.D.3.a,c, and figure II.16.

1258 See Emiliozzi 2006.

1259 Emiliozzi 1997, 145–151, and pl. V.1. The principle is the same in Egyptian chariots; see Littauer and Crouwel 1985, especially 67, no. 3, pl. LXIX bottom (chariot from the Tomb of Yuia and Tuiuu).

1260 Depictions occur on Etruscan-Italic terra cotta plaques that represent vehicles taking part in a procession (see s.g. Crouwel 2010, figs. a–d), and on the bronze sheet covering chariot II from Castel San Mariano (Höckmann 1982, pl. 30, left), and on the left panel of the Monteleone chariot (Emiliozzi 2011, Figure I.25).

1261 An actual Greek-type chariot is the *biga* from the Regolini-Galassi tomb of Caere mentioned in footnote 9 above.

1262 Galeotti 1986–88.

1263 Emiliozzi 1992, no. 36; Landolfi, De Palma, Usai, Emiliozzi, and Wilkens 1997, figs. 19, 21–23, pls. XXV–XXVIII.

1264 Camerin and Emiliozzi 1997, nos. 23, 29, 57, 59, 60, 73, 75, 113, 116, 121, 131, 142, 144, 145, 147, 149, 150, 164, 165, 187, 205, 210, 225, 228, 230. Further discoveries have occurred since 1997.

1265 Colonna 1997, 21.

1266 Camerin and Emiliozzi 1997, nos. 29, 57, 94, 102, 144, 164, 165, 187, 210, and 230.

1267 La tomba del principe 2006; Emiliozzi, Moscati and Santoro 2007.

1268 Emiliozzi 1997, pl. X.

1269 Reconstructions as a four-wheeled vehicle are unacceptable (Höckmann 1982, 27, fig. 12; Danesi and Manconi 2009). The correct reconstruction as a two-wheeled cart is provided by Emiliozzi 2013, 62–75 (very different from Bruni 2002, figs. 8, 12).

1270 The carts provided with a front seat carried two people sitting side by side (see Fig. 24.7), while those with a center seat (see footnote 21 for the cart from Eretum) could carry four sitting back to the back, as seen in contemporaneous Greek depictions (Emiliozzi 1997, pl. XXIV).

1271 See Stopponi 2002a, 234–235, road links between Perugia and Volsinii/Orvieto; Bruschetti 2002, 71, roads from Perugia to Lake Trasimeno, to Valdichiana and to the Clusium area; suggestions about the roads radiating from Fiesole, Arezzo and Cortona are provided by Giulierini 2011.

1272 This is the case of the road system that linked traffic between the Tyrrhenian and

Adriatic Seas (from Pisa to Spina by way of Marzabotto and Bologna), following the fourth-century geographer Pseudo-Skylax (*Peripl*, 17).

The author wishes to thank the three main scholars who pioneered Etruscan music archaeology, Günter Fleischhauer, Jean-René Jannot, and Bo Lawergren, who, along with Giovanna Bagnasco Gianni, Francesca Berlinzani, Beatrice Casocavallo, Fritz Jurgel, Marina Micozzi, Susanna Sarti, John C. Franklin, Paolo Giulierini, Roberto Melini, Renato Meucci, Giulio Paolucci, and Maurizio Martinelli, provided their support to the present article. Special thanks to Marco Pacciarelli for the first push, to Alessandro Naso, who firmly encouraged me during my work, and to Peter Holmes for his invaluable help in amending the final version of this chapter.

- 1529** von Hornbostel and Sachs 1914.
- 1530** Summaries of the evidence for musical instruments in Etruria in Fleischhauer 1964, 1995, 2001; Jannot 1988; 1990; Heurgon 1992, 267–78; Lawergren 2007; Martinelli 2007, 21–52; Carrese, Li Castro, and Martinelli 2010; Paolucci and Sarti 2012; Maggiani 2013.
- 1531** On Etruscan double-tube reed aerophones see Jannot 1974; 2001; Martinelli and Melini 2010; Sutkowska 2010.
- 1532** Confirmed by Plutarch (*Mor.* 456b).
- 1533** The simplified term “double pipe” has been widely adopted in this chapter, though according to Sutkowska 2010, 79, the technical term should be “double-tube reed aerophone.”
- 1534** See Grandolini 2010 for a summary of ancient sources on Etruscan musical instruments, including the double pipe.
- 1535** Sarti 2012a, figs. 10.1–11.
- 1536** Martinelli and Melini 2010, 96–97, 102–3, figs. 1–2, 12–13; Martinelli 2012.
- 1537** For example, a joint (probably made of bone) in the Museo Nazionale of Tarquinia, without inv. no.; see Colivicchi 2007, 202–3, fig. 49, no. 497; Majneri and Stanco 2010, 122, fig. 6.

1538 Steingräber 1984; 2006; Li Castro 2010, fig. 1a.

1539 Jannot 1984, 426; Li Castro 2010, fig. 1b.

1540 According to Olsen 1990, 185, this feature should be indicative of “a resistance typical for playing reed instruments.”

1541 Unfortunately, few of the metal wind instruments from Etruria have yet been analyzed to determine their specific composition or the percentage of tin in the copper alloy, except for one fragment at Karlsruhe that is identified as tin bronze (see footnote 33 below), and some instruments recently analyzed by the “Michele Cordaro” laboratory of the Università della Tuscia (DISBEC) as a partner of the European Music Archaeology Project (EMAP): one *lituus* from Tarquinia (see footnote 30 below), another *lituus* from Cortona (see footnote 32 below) and one *cornu* from Populonia (see footnote 35 below), which have shown different percentages of tin in the alloy, with a range from two to six percent. The author wishes to thank the EMAP team of the DISBEC for this preliminary information.

1542 On Etruscan trumpets see Jurgeit 2005; Holmes 2008, 2010.

1543 For a comprehensive collection of ancient sources on Etruscan trumpets see Berlinzani 2007; see also Meucci 1987; 1989; 1991.

1544 Florence, Museo Archeologico Nazionale, inv. no. 83379/c, from Poggio dell’Impiccato, Tomb 1, first half of the eighth century; see Delpino 2005, 346, 348, 350, pl. II; Li Castro 2012.

1546 See footnote 10 above.

1547 In Golini Tomb II and the Tomb of the Hescana; see Steingräber 1984, no. 34, 285; no. 69, 314; Martinelli 2007, 47–48, n. 47.

1548 In the Tomba della Scimmia (Tomb of the Monkey) and the Tomba di Poggio Renzo; see Steingräber 1984, nos. 32–33, 284–85; Blanck and Proietti 1986, 24 nn. 95–96.

1549 Blanck and Proietti 1986, 24–27, 42, fig. 6, 13, pls. XVIb, XXII.

1550 See footnote 11 above.

- 1551** Castaldo 2010, 49–50, figs. 5–6.
- 1552** For example, see Fleischhauer 1964, 42–43, figs. 16–17; Martinelli 2007, 48.
- 1553** For example, an Etruscan black-figure amphora from Vulci (end of the sixth century) in the British Museum (inv. no. B 64).
- 1554** Cassola Guida 1997; Principi 2000, 373–74.
- 1555** Macellari 2002, 200–202.
- 1556** For example, a sarcophagus decorated with painted reliefs from Caere (fifth century) in the Museo Gregoriano Etrusco, inv. no. 59; see Fleischhauer 1964, 40, fig. 15.
- 1557** Briquel 1987; 2000, 41; Carandini 1997, 58–71, 211–15, 306–11, 559–63; Bonghi Jovino 2007, 6–9.
- 1558** Bonghi Jovino 2007.
- 1559** Helbig 1963–72, 1:515–16, no. 682. The provenance of this find is alternatively assigned to Cerveteri, for example by Behn 1912, fig. 7; Albini 1937; and Fleischhauer 1964, 44, fig. 19; on this question see also Bonghi Jovino 1987, 72 n. 55.
- 1560** Cortona, Museo dell'Accademia Etrusca e della Città di Cortona, without inv. no., around 600 BCE; see Giulierini 2012; Bruschetti et al. 2012, 166, no. 39. The author wishes to thank Paolo Giulierini, former director of the local museum, for allowing scholars to study this interesting specimen, which was found bent in the same way as the *lituus* from Tarquinia.
- 1561** Jurgeit 1999, 227–28, no. 367, pl. 111 (inv. F 298, provenance: Etruria; Riederer 1999, 315–16, no. 367).
- 1562** The “Berlin *lituus*” is in the Stiftung Preußischer Kulturbesitz Staatliche Museen zu Berlin; the author wishes to thank Peter Holmes for this information. The current whereabouts of the “London *lituus*” (Sotheby’s 1982, no. 244; 1983, no. 549) are not known.
- 1563** Florence, Museo Archeologico Nazionale, inv. no. 152342, from the Tumulo dei Carri, necropolis of San Cerbone; see Sarti 2012b, figs. 16a–c.
- 1564** Holmes 2010.
- 1565** Rome, Museo Nazionale Etrusco di Villa Giulia, inv. no. 51216, fourth century BCE; see Jurgeit 2000.
- 1566** See footnote 13 above.
- 1567** Jurgeit 2005.
- 1568** The “London *lituus*” appears to be the only one that has survived with its mouthpiece, but it is difficult to take this evidence into account on the basis of nothing but the one available photo and without any further detail. On the other hand, the “Cortona *lituus*” appears to have been provided with a wooden mouthpiece, remnants of which are still inside the instrument’s receiver, but further investigation is needed; see Holmes 2010, figs. 51–52.
- 1569** Poll. 4.85–86: “The tube yard is made of bronze or iron, the mouthpiece is made of bone.”
- 1570** Lat. *bucina* rather than *cornu* is more likely the proper term for these horns of horn or ivory, and also for those in clay, as well as the conch trumpets; see Meucci 1983, 1989; Berlinzani 2007, 15, n. 8.
- 1571** Rome, Museo Nazionale Etrusco di Villa Giulia, inv. 13229 (ivory, amber, and gold), from the Tomba Barberini, first half of the seventh century; see Proietti 1980, 284, no. 396.
- 1572** It has also been interpreted as a drinking horn; see Romualdi 1997. Unfortunately, a related fragment that according to Minto 1943, 119, was a possible mouthpiece, “almond-shaped, with an elliptical hole,” is currently lost.
- 1573** The Tumulo dei Carri, in the Necropoli di San Cerbone. Florence, Museo Archeologico Nazionale, inv. 222027 (ivory, silver, and gold); see Romualdi 1997; Martinelli 2007, 46–47.
- 1574** Rome, Museo degli Strumenti Musicali, sixth century; see Cervelli 1994, 51.
- 1575** Montelupo Fiorentino, Museo Archeologico, inv. 114918, end of fifth – fourth century; see Alderighi 2012.
- 1576** For a discussion of all these items, see Jannot 2010.
- 1577** Jannot 2010, 178 n. 13.
- 1578** Fleischhauer 1964, 44, fig. 20; Fleischhauer 1995, 192–93, fig. 6.

1579 Rizzo 1989, 154, pl. Ib.

1580 Cataldi 1993, 119–20.

1581 Rizzo 1990, 126, fig. 257.

1582 Additional plectra of Etruscan origin, stored in various museums, have been recorded but remain unpublished.

1583 Possibly made from a turtle shell or a gourd, or of wood.

1584 Further discussion of Etruscan string instruments in Jannot 1979; Lawergren 1984; 1993; 2007; Sarti 1993; 2010.

1585 The *phorminx* is possibly a similar type of string instrument, with a rounded crescent-shaped soundbox and often with elaborate arms, represented in iconographical sources dating back to the Aegean Bronze Age; on the *phorminx* see Younger 1998, 18–27.

1586 Würzburg, Martin von Wagner-Museum, inv. no. ZA 66 (Martelli 1987, 18, 92, 262–63, no. 38; 1988; 2001, 2–7; for further discussion of this amphora see also Pairault-Massa 1992, 16–18, figs. 1–2; Menichetti 1994, 48–49, fig. 30; Simon 1995a; 1995b. In the extensive literature on the meaning of the scene on the amphora, very few lines have been dedicated to the unusual shape of the arms of the musical instrument. They have a winding shape with two joined S-curves, like the outline of an inverted guitar; see Li Castro and Scardina 2011.

1587 Lawergren (1993, 75; 2007, 137) compares this example with an instrument represented on a Minoan seal; the comparison, though questionable, is rather fitting from an organological point of view.

1588 In Tarquinia there are at least thirty-four depictions of these instruments; see n. 10 above.

1589 For example, these instruments are represented at least fourteen times on the urns from Chiusi; see footnote 11 above.

1590 The classic Greek kithara is seldom represented in Etruscan context, and the few examples likely indicate poor knowledge of this complex string instrument, as in the Tomba della Pulcella (Tomb of the Maiden) in Tarquinia (Steingraber 2006, 158); on this aspect, see Lawergren 2007, 127–28, fig. 5; Sarti 2010, 187–88.

1591 Including bells, cymbals, rattles, scrapers, jaw harps, singing bowls, and many other objects that can be simply identified as sound tools, or sometime considered only as symbols of prestige, ornaments, or toys, such as sticks with suspended elements, bracelets, anklets, jingles, etc.; on these categories of musical objects in Etruscan context, see Carrese 2010; Maggiani 2013.

1592 Li Castro 2008.

1593 Brocato and Zhara Buda 1996.

1594 Cavallotti Batchvarova 1967, 244–50 (tomb GG 6–7), fig. 98, no. 8.

1595 Maggiani 2013.

1596 Jurgeit 1999, 228–31, pl. 112; Riederer 1999, 315–16, nos. 368, 379.

1597 Morigi Govi 1971.

1598 For example, a hollow *armilla* with tinkling particles of bronze inside, in the Museo Archeologico Nazionale in Chiusi, inv. no. 62782 (P. 785a), Collection Paolozzi, without provenance; see Iozzo 2009; Berutti 2012.

1599 In Tarquinia there are at least nine depictions of *crotala*; see footnote 10 above.

1600 In this repertoire the *crotala* are represented at least three times; see footnote 11 above.

- 1957** On the period in general Torelli 1981b, 251–78; for an overview of the period of the Roman conquest, Harris 1971 is essential.
- 1958** Torelli 1985, 45–48.
- 1959** The mechanics of the allocations to the rural tribes are described in the classic work of Ross Taylor 1960.
- 1960** Torelli 1981b, 71–83; more recently, Torelli 2015, using epigraphic and archaeological evidence from the sanctuary of Gravisca, has reconstructed the end of the *servitus* at Tarquinia in the late 5th century BCE. An articulated picture of Clusium society during the era of Romanization has been drawn by Benelli 2009.
- 1961** According to Rix 1963, at Chiusi the ex-servi did not possess the *conubium*, which conversely was granted to their equivalents at Perusia (and Cortona, as we can now say in view of the *Tabula Cortonensis*: Scarano Ussani and Torelli 2002); as for the grant to ex-servi of the *ius honorum*, we cannot affirm or deny that this took place, keeping in mind that it is quite likely that the right was presumably granted to them in different ways and times.
- 1962** Rix 1963.

- 1979** Torelli 2012.
- 1980** Torelli 1999b.
- 1981** See most recently the essays in Aigner Foresti 1998.
- 1982** The literature on the topic is endless (bibliography in Valvo 1988; but see also Harris 1971, 31–40): the problem of the dating of the fragment (which we believe belongs to the *Corpus* of Gromatici), which speaks of the completion of the last *saeculum* which the Etruscans assigned to the life of their own people, becomes further complicated by the uncertainties around the calculation of the length of the Etruscan *saecula*.
- 1983** Harris 1971, 271–98.
- 1984** This is the climate of the countryside of Tarquinia described by Cicero in the speech *Pro Caecina* (Frier 1983).
- 1985** See most recently Belfiore 2010.
- 1986** For Heurgon 1969b, relying on App. *B Civ.* 92.426, he was a follower of the Marian consul Cn. Papirius Carbo in Africa in 82, while for Sordi 1991 it is a matter of agrarian

allocations among veterans by Marius, whose activities in Africa not only included the foundation of colonies labeled *Marianae*, such as Uchi Maius (*ILS* 1334) and Thibaris (*ILS* 6790), but also the distribution of lands to his own veterans ([Aur.Vict.] *De vir. ill.* 73): Sordi's thesis seems more plausible than that of the French scholar.

1987 Sordi 1972; 1985.

1988 Harris 1971, 251–71.

1989 Munzi and Terrenato 1994.

1990 Cato fr. 62 P; cf. Livy 1.2, 5.33.

1991 The resistance was stronger in the northern cities, judging by the inscriptions; in general, on the problem of the survival of the Etruscan language once again Harris 1971, 169–87 remains valid, to which should be added Hadas-Lebel 1998.

1992 Mazzarino 1957; the general matter of the Romanization of Etruria is discussed by Mansuelli 1988.

1993 And perhaps not only in that sphere, if e.g. the popular hypothesis is true that the Italian word *matton* “brick,” of unknown etymology, is an Etruscan relic: Bolelli 1989, s.v. *Mattone*.

1994 The data are set forth in Torelli 1969 and 1982.

1995 Keppie 1983; 1984.

1996 Pliny's famous phrase (*HN* 3.70) describing the fate of the Campanian city of Stabia.

1999 Populonia: Gualandi and Mascione 2004; Perugia: Torelli 2011c, 86; Volaterrae: Bonamici 2011, with previous literature.

2000 Leo 1913, 291–94.

2001 See the collection of fragments by Santini 1995.

2002 Cited both by Servius (*Aen.* 10.200; *Serv. Dan.* 10.198) and by Verrius Flaccus, who was in turn author of *res Etruscae*: Torelli 1975, 146 n. 1.

2003 Musti 1970; 1981.

2004 Sordi 1960; 1989a.

2005 Also recorded in the *Liber Coloniarum* (215.3 L).

2006 Bocci Pacini and Nocentini Sbolci 1983, 31–33 n. 42.

2007 II13.2, 78–84; these are, as is well known, not exact copies.

2008 Heurgon 1969a; Torelli 1975, 142–46; Colonna 1987.

2009 Fuchs 1989.

2010 Torelli 1985, 39–48; Fuchs 1989, 53–54 n. 1.

2011 Liverani 1989, proposed substantially a reconstruction along the lines traced by Bormann 1887, 104–7, 124–26. Although ultimately he does not clarify in depth the function of the monument, perhaps a statue base rather than a throne or seat, his is currently preferable to my suggestion Torelli 1985, which sees the sequence as an itinerary.

2012 On this subject, besides Torelli 1985, see *La lega etrusca* 2001 and refer to these for the relevant bibliography.

2013 Recent discussion in Maggiani 2001.

2014 Liou 1969; Torelli 1971; Liverani 1989.

2015 Discussion in Torelli 1971.

2016 From the reign of Augustus is the Cortonan [C. ?] Metellius C. f. Stell. of *CILXI* 1905, which is difficult to read [*aed.*] *Etruriae* as suggested by Liou 1969, 68–70, but is rather [*pr(aetor)*] *Etruriae*, as already suggested by Bormann in *CIL ad loc.*, who also speaks very clearly in favor of the “high” chronology of the inscription on the basis of paleography. The inscription *CIL* XI7979, which mentions the *praetura Etruriae* of Sex. Valerius Sex. f. Clu. Proculus, comes from within a known Hellenistic hypogeum of the Perusine type of Vettona (Cultrera 1916; Scarpignato 1991). It was used from the second century BCE until the reign of Tiberius. Opposite has come to light a copy of the same text (Bonamente 1996), perhaps assignable to a reuse (for reasons of prestige) of a sepulcher of the late first or the second century, the period of the paleography of both inscriptions. It should not be considered, as I thought at one time (Torelli 1971, 493–94), a proof of the existence of the office in the Augustan-Tiberian period.

2017 Preliminary report in Stopponi 2009, with previous literature.

2018 Stopponi 2007, 501, figs. 40–42.

2019 “Bathing that dissolves fatigues” is the characterization of bathing found in the monumental Greek inscription of the Baths of the Forum of Ostia (Lazzarini 1983).

2020 Plin. *HN* 34.34; cf. Colonna 1998.

2021 Torelli 1968.

2022 Stopponi 2006.

2023 Scheid 1990, 677–94.

2024 Lists in Liou 1969 and Torelli 1971, to which add the Volsinian *praetor Etruriae* [-Pompeius Vopiscus C. Arrunt[ius Cate]llius Celer *cos. suff. c. a* 140, made known by Gros 1980 (= *AE* 1980, 426). For the importance and prestige of the *praetura Etruriae*, we may note that in this person’s *cursus* the mention of the *praetura Etruriae* occurs between the consulate and proconsulate of Africa, the highest positions he could hold.

2025 SHA *Hadr.* 19.1. Of the 13 known *praetores Etruriae*, 6 are senators, 3 *equites*, and 4 municipal magistrates (probably all *equites*); the 4 known *aediles Etruriae* are all municipal magistrates of unknown affiliation to the official orders of senators and knights.

2026 See most recently Amann 2002.

2027 Liou 1969, 88 n. 2. The title *iuratus ad sacra Etruriae* in *CIL* XI1848 = *ILS* 5019 must refer to the position of town delegate who contributed with the representatives of the other cities to the election of the *praetor* and the *aedilis Etruriae*.

2028 For these problems fundamental is Smith 2006, with extended discussion of the ancient

sources.

2029 For all the literature ancient and modern relating to the exhibition of lineages in patrician houses, see Flower 1996.

2030 Sordi 1989b; see also Ramelli 2003.

2031 Pers. 3.27–28: “an deceat tibi pulmonem rumpere ventis / stemmata quod Tusco ramummillesime ducis ?” (trans. Ramsay 1965).

2032 On this character, the bibliography is endless: for his Etruscan origins see Eberle 1958; on the literary aspects André 1967; most recently Freudenburg 2009.

2033 Colonna 2011.

2034 The date of the urn *ET* Pe 1.313 = *CIL* XI1963 = *CIL* I(2) 2037 is generally placed in the reign of Augustus on the basis of its material, marble, in my opinion a conviction without solid grounds. The reconstruction of the administrative history of Roman Perugia, which bears directly on the question of who was writing here, has recently interested (Sisani 2011), with arguments I intend to return to in a near future.

2035 Torelli 1975, 23–102.

2036 Morandi and Colonna 1995 have suggested seeing in the tomb an original foundation of the *Smurinas*, patently a very unlikely conjecture. Now Torelli 2013–4.

2037 Campana and Maggiani 1989; cf. Maggiani and Cherici 1986; Agostiniani and Giannecchini 2002, with previous literature.

2038 Fiorelli 1876, 19–20.

2039 See Torelli 1975, 97; on the Tomba del Cardinale, see A. Morandi 1983.

2040 Cic. *Div.* 1.119; *Fam.* 9.24; Suet. *Iul.* 81; Val.Max. 8.11.3; Plut. *Caes.* 63.1–7; perhaps the same *summus haruspex* who was close to Caesar in Africa in 46 BCE from Cic. *Div.* 2.52.

2041 *CIE* 5427 = *ET* Ta 1.16, identical to *CIE* 5566 (Morandi in *REE* 1997 [1999], 424–27, n. 47); on these events of the family tomb of the *Spurinas*, see now Torelli 2013–4.

2042 Nep. *Att.* 18; cf. Torelli 1975, 95–96.

2043 Torelli 2006.

2044 Intelligent discussion of the artistic program and of current interpretations in Lippolis 2011.

2045 Sources and documents in Torelli 1999a.

2046 Torelli 1999b, 150–64, with discussion of both the “Throne” and the family fortunes of the Plauti.

2047 Heurgon 1964, 83–84.

2048 Torelli 1975, 70–72.

2049 Cic. *Leg.* 2.19.21; cf. *Har.resp.* 9.18.

2050 Thulin 1905–9 remains fundamental.

- 2081** It was reinvestigated in 1999; see Karlsson 1999.
- 2082** A similar arrangement with a channel and post holes at certain distances on the inside was found at Bronze Age Troy in 1998, belonging to Troy II (2550–2250 BCE); Jablonka 1999, Abb. 18–19.
- 2083** Negroni Catacchio and Domanico 2001, 341; Negroni Catacchio 1995.
- 2084** Hut Ab. 2 in Settore III; Negroni Catacchio and Domanico 2001, 351.
- 2085** The hut has a similar construction to wooden Norwegian stave churches, with their higher central nave; see Storsletten 2001.
- 2086** Erixon 2001, 453f.
- 2087** A good example comes from Fidenae, in Latium: see Bietti Sestieri and De Santis 2001, 212, with further bibliography. The hut from the ninth century BCE has a rectangular plan with slightly convex side walls and measures 6.20 x 5.20 m. It is surrounded by a wide oval ring of postholes, in which posts were placed to support the eaves of the projecting roof. The

hip roof would have been almost oval in plan, continuously sloping down on all sides of the building. The walls were built up between upright standing wooden props placed at intervals of about 70–80 cm. The thickness of the walls was only about 20–25 cm. In the middle of the interior, four postholes, creating a wide square with sides of about 2.2 m, indicate the supports for the roof.

2088 Karlsson 2006, 125, 135.

2095 Linington 1982, 117; see also Bonghi Jovino 2001.

2096 Bartoloni 2001, 361.

2097 As seen e.g. in the hut on the Palatine in Rome, dated to the eighth century. It consists of a rectangular deep cutting, creating the floor space, with outward-bowing sides. Along the edges of the cut for the floor there are substantial postholes cut into the bedrock. One post stands in the center of the hut, supporting the ridgepole.

2098 See the corpus by Bartoloni et al. 1987 and Bartoloni 1998.

2099 For a longer discussion, see Damgaard Andersen 2001, 246–248.

2100 From Poggio Selciatello necropolis, tomb 45; Cristofani 1985, 50f.

- 2101** This is seen in the early houses of Old Smyrna in Asia Minor, as well as at Leontinoi in Sicily.
- 2102** Dugouts in the soil were discovered at Acquarossa. Eva Rystedt (2001) interprets them as dugouts for huts.
- 2103** Vitr. II.I.3 (transl. F. Granger, Loeb Classical Library).
- 2104** Ridgway and Serra Ridgway 1994. I thank N. Winter for this reference.
- 2105** On this issue, see also Colonna 1986.
- 2106** Karlsson 2006, 135 (Cat. nos. 247, 274, 298 and 328; figs. 188, 211, 224 and 250).
- 2107** H.M. Morgan (1914, 39) translates this passage as “lumps of dried mud.” Vitruvius uses forms of the term *luto*, which in the Oxford Latin Dictionary (Oxford 2000) is translated “to cover with mud or clay, daub.” It thus seems difficult to know whether Vitruvius means mud or clay when he talks about this material.
- 2108** The area was excavated in 1960–1965 and published in 2006. The pottery consisted of spiral amphorae, buccheroid impasto and the so-called Faliscanizing kantharoi (see Karlsson 2006, 151). The pottery is of the same types that were discovered in the Tomba della Capanna (Tomb of the Thatched Roof) in Cerveteri, now dated to around 700 BCE: see Naso 2001, 35; Prayon 1990, 513, who dates it to 680 BCE, and Prayon 2001; see also Boëthius 1968.
- 2109** Thirty-eight daub fragments were found in House I, several with impressions of branches (see Karlsson 2006, 147, fig. 272).

- 2197** Although not well preserved, this *corredo* includes, among other things: thirty-five bobbins, a bronze distaff, at least twenty-four fibulae (one with a wrapped gold wire, and fourteen with amber elements on the bow), a tripod and two bronze vases, a bronze girdle, iron andirons, more than 138 amber beads and pendants, 1,138 glass beads, *faïence* amulets, gold beads and ornamental discs, an electrum spiral.

2198 Hencken 1968: 200–20; Kilian 1977; Babbi and Peltz 2013.

2199 Carandini 1997; 2006.

2200 Peroni 1981.

- 2201** Pacciarelli 1991.
- 2202** Iaia 1999, 123; see also Trucco 2008.
- 2203** A very similar situation can be found in Veii, in the opening areas of Grotta Gramiccia and Quattro Fontanili necropolises (Bartoloni 2003, with previous literature) as in some of the oldest burial settlements in Sala Consilina (Trucco 1994) and in the early stage of S. Vitale necropolis in Bologna (Pincelli and Morigi Govi 1975).
- 2204** e.g. in Vulci, Tarquinia, Bisenzio, Veii and Caere.
- 2205** In the Po Valley, we can find cobblestone-covered pit-tombs or with lytic box in the necropolises in and around Bologna (Pincelli and Morigi Govi 1975; Silvestri 1994, with previous literature).
- 2206** Spinning tools have been found in several women's graves, but they are much more in these ones.
- 2207** Weapons are not usually found in men's graves at this stage.
- 2208** Peroni 1981.
- 2209** Berardinetti and Drago 1997, 40.
- 2210** Carandini 1997, 475.
- 2211** Some examples of men's graves are known in Tarquinia, Vulci and Vetulonia.
- 2212** We refer especially to the famous sheet bronze urn in the Osteria necropolis at Vulci (Fig. 39.6), which has been interpreted as a reproduction of a hut used in worshipping practices (Torelli 1997a).
- 2213** *Fibulae* are often burned, suggesting the practice of lying bodies on the pyre with their clothes and ornaments, maybe after an exposition of the deceased. At times there are also unburned *fibulae* which are plausibly intended to individualize the dead even after his cremation.
- 2214** Bartoloni et al. 1997, 90–6.
- 2215** In Etruscan Campania, we can observe, at this stage, burials in quadrangular graves, which are emphasized by a circle of square stone tuff blocks or travertine slabs (d'Agostino and Gastaldi 1988, 241), while in northern Etruria—for example at Vetulonia—broken circle graves are largely used and house burials of members of the same family, which are placed in circles of stones wedged into the ground (Bartoloni 2003, 96–7, with previous literature).
- 2216** Ghini et al. forthcoming.
- 2217** Often containing servings of food or beverages.
- 2218** Beside the pyre during the cremation (pottery placed in the *main chamber* usually with the burnt carbon remains) or, in the deposited defunct honor (pottery placed in the “*dromos*”) at the time of tomb covering.
- 2219** To this we can refer, as a rite of passage, the intentional breaking of the objects used during the ceremony and placed, even partially, into the grave.
- 2220** Delpino 1977, 175.
- 2221** Bartoloni 1984, 21.
- 2222** d'Agostino 1982.
- 2223** Metal cinerary urns and clothes wrapping the burned remains are used from this period in some Etruscan graves and that can be related to a clear reference to the Greek rituals. (Bartoloni 1984, 13–15; d'Agostino 1996).
- 2224** Delpino 2005.
- 2225** This cinerary urn was also placed in the lower part in a bronze half sphere, probably used as the mask after the receiving of Hellenic heroic funeral ceremonies in Tarquinia, which were adapted to the oldest funeral rituals by the local aristocracy.
- 2226** Bartoloni et al. 1997, 100.
- 2227** Mangani 1995, 385.
- 2228** d'Agostino and Gastaldi 1988, 197.
- 2229** Trucco 1994.
- 2230** Boiardi von Eles 1994, 102; Trocchi 2004, 64.
- 2231** It has been studied that ritual dressing, showed by ornament goods and/or weapons upon

or at the feet of the cinerary urn in Verucchio graves, is a widespread phenomenon both in female and male tombs (Bentini et al. 2015).

2232 Boitani 2004.

2233 Torelli 1997a, 38; 2006, 410.

2234 Tovoli 1989, 142–4.

2235 De Santis 2005.

2236 In this phase imported vases from Greece or the Near East were commonly used, especially in southern Etruria and in Campania. These vases were displayed as *keimelia* with the grave goods. That was a sign of commercial trade, spread in the form of aristocratic gifts, ever more firmly in the hands of local elites (for an overview: Sciacca 2010). The use of these products, soon locally imitated with frequent formal contamination with types of Central Europe, will have a key role in the spread of Greek and Near Eastern conviviality manners among members of the rising Tyrrhenian elites (Iaia 2010, 40–41, with previous literature).

2237 Horse harness elements are not exclusively used for male burials. In women's graves they can be connected to certain uses of chariots.

2238 Torelli 2006.

2239 Transmitted even in the female line. In Etruria, axes are not exclusively a male attribute. In Veii and Verucchio they can be found in women's graves from the late eighth and the early seventh centuries (Berardinetti and Drago 1997; von Eles 2007, 83).

2240 Laneri 2007.

2241 As for the actual location of these people, it has been suggested to identify them as a sort of *reges curiarum*, from the Roman model (Menichetti 2000, 205).

2242 Several Latin historiographical and literary attestations, concerning liturgies even for the early Etruscan religion, can be in some cases added to these data.

2243 Bonghi Jovino 2008 with previous literature.

2244 Anthropological analysis showed that he was an albino person affected by encephalopathy. This could have been a special ritual for “*monstrum*” figures.

2245 The presence of a Euboic *olla* on the body suggest the identification of this man as a Greek. The remains analysis showed that he died from violent death.

2246 Naso 2012 with previous literature.

2247 For example, the wall cross-boundary.

2248 Several examples are known in Tarquinia (Iaia 1999), in Veii (Berardinetti Insam 1990, 12), in Vetulonia (Delpino 2007) and in many male and female elite burials, in and around Bologna (Trocchi 2004, 63; Locatelli 2010, 219–20).

2249 Torelli 1997a, 38.

2250 Naso 2006.

2251 Tovoli 1989; Naso 2006.

2252 Torelli 2006.

2253 The described vascular forms have been related to the roman *praefericulum*, a worship vase described by Festus as owned by *rex sacrorum* and *regina sacrorum* (Fest. 292. L) and connected with the worship of *Ops Consiva* (Torelli 1997b; 2006).

2254 Documented by graves in Bisenzio, Veii, Roselle, Vetulonia, Chiusi (Cygielman and Pagnini 2006 with previous literature), and in Verucchio (von Eles and Trocchi 2015).

2255 Delpino 2007.

2256 For a complete description and the main interpretations of this depiction, representing many religious but also social and political implications: Torelli 1997a; Carandini 2002, 239–54; Pacciarelli 2002. For a typological analysis of this item: Iaia 2010, 36–7). One of the oldest examples of these cups comes from this rich woman's grave

2257 Torelli 2000 with previous literature.

2258 Torelli 1997a, 41.

2259 The embracing act is more emphasized in the plastic group lid in Chiusi, interpreted as a sexual union between the defunct and the underworld goddess (Torelli 1997a).

2260 Torelli 1997a; Pacciarelli 2002. See also **chapter 16** Chericì.

2261 For this priest college in Etruria we refer to the famous tomb 1036 in Veii Casale del Fosso (Boitani 2001, 112), with two bilobed shields (lat. *ancilia*) covering the deceased. The burial is enriched with a complete *panoplia*, a scepter and a club. The use of this kind of armor refers to the Salii priesthood, traditionally founded by the Roman king Numa, but also attested later. The club used to beat on the *ancilia* is closely related to the Salii worship. For this grave we refer to Morrius, king of Veii (Colonna 1991), who was connected with Numa in Servio's *epitome* to Virgil's Aeneid (Serv. *Aen.* 8.285).

2262 Pacciarelli 2002.

2263 The spear and club armed character would then be the hero in his act of facing *Cacus*, the robbery perpetrator.

2264 The choice of Heracles would be intended to represent warrior values and the acceptance of common rules and proprietary rights, which are recognized to be basic values for the authority of the aristocracy of the main Etruscan sites. The fact that it is a “class” affirmation and not an individual one is well proved by the placement of the representation of this male ritual on the monumental cinerary urn in a woman's grave.

2265 A direct relationship between Etruria and Euboean Greek world certainly started from the second quarter of the eighth century (d'Agostino 2006).

For comments on the text, forwarded articles and discussion, I would like to thank Prof. A. Naso, Prof. G. Bartoloni, Prof. A.M. Bietti Sestieri, Dr. A. de Santis, Dr. F. Delpino, Dr. C. Iaia, and my students.

2266 Many aspects of the economy of the Early Iron Age in Etruria are presented in other chapters; topics such as shipping (**chapter 22** Pomey), mines (chapters 25 Zifferero and 26 Corretti), weights (**chapter 28** Maggiani) and settlement patterns (**chapter 72** Zifferero).

2267 These topics are examined in other chapters. See chapters 41 Pacciarelli and 44 Iaia.

2268 E.g. Barbaro 2010.

2269 The majority of these prescribed burial grounds grew considerably in the centuries to come.

2270 E.g. Nijboer 2008, 426.

2271 See **chapter 41** Pacciarelli. The term “chiefdom” needs to be specifically defined for conditions in Etruria. The few EIA 2 elaborate warrior tombs might represent chiefs but their position does not seem to become hereditary. The figurehead can be labeled chief, rex or king. As such he represented the formal cooperation of the various clans and their respective heads living in the main settlements of Etruria (De Santis 2005; Nijboer 2008, 440–4). It is probable that early state formation started in EIA 2.

2272 These figures are rough estimates and varied per site or territorial unit. I have maintained low to average figures.

- 2273** See chapters 69 Perkins and 72 Zifferero.
- 2274** E.g. Costantini and Costantini Biasini 1987; Barker and Rasmussen 2000, 73–4.
- 2275** E.g. Delpino 1997; 2007; Mori Secci 2005, 70–2; Bonghi Jovino 2010, 163.
- 2276** E.g. Fiorentino 1995; Elevelt 2002; Cazzella and Recchia 2009, 27–8.
- 2277** Bartoloni 1989, 51.
- 2278** Nijboer 1998, 235–40 (Figs. 25.1 and 26.1).
- 2279** Zifferero 1991; 1992; Giardino 1995.
- 2280** Östenberg 1983; Zifferero 1991, 219–21.
- 2281** Similar evidence is recorded from the nearby settlement at M. Piombone (Nardi 1972, 106).
- 2282** Nijboer 1998, 208–209, 238. Giumlia-Mair states that the provenance of tin in Italy is still unresolved and that it might even derive from central Europe (Giumlia-Mair 2003). This remains a hypothesis, though exchange routes between Italy and central Europe existed from ancient times onwards and intensified during the ninth and eighth centuries; see **chapter 44** Iaia.
- 2283** See **chapter 41** Pacciarelli; Barker and Rasmussen 2000, 61.
- 2284** Warden 1984.
- 2285** Bietti Sestieri 1981.
- 2286** However, this possibility cannot be entirely excluded. In a comparison study of seven early civilizations (early city and territorial states), Bruce Trigger mentions mining often as corvée labor (Trigger 2003, 377–89).
- 2287** Mandolesi 1999, 174; 1996, 56; for other sites, see Pacciarelli 2001, 170–6.
- 2288** Mandolesi 1996, 57.
- 2289** Consult for more data on this issue, **chapter 44** Iaia.
- 2290** E.g. Bietti Sestieri 2005, 20–21.
- 2291** For a reconstruction of the amber trade during the Late Bronze Age, see Negroni Catacchio, Massari and Raposso 2006.
- 2292** Nijboer 2011; http://151.12.58.75/archeologia/bao_document/articoli/1_NIJBOER.pdf
- 2293** Mielke and Torres Ortiz 2012; Nijboer 2011. Others have discussed the introduction of iron using different data: e.g. Delpino 1988; Nijboer 1998, 219–35; Vanzetti 2000, 149–150. Iron might have been worked occasionally in Italy from the last phase of the Final Bronze Age onwards (e.g. Delpino, Giachi and Pallecchi 2004). A fully-fledged use of iron in Italy pertains to the ninth-eighth centuries and later.
- 2294** Hart 1982. The sequence is discussed in Nijboer 1998, 62–3.
- 2295** Nijboer 1998, 297–338. It needs to be stressed that even in pastoral societies opportunities were created for exchange on much-frequented locations such as bush markets (Brown 1995, 2).
- 2296** Pare 1999; Peroni 2001; Cardarelli, Pacciarelli and Pallante 2001.
- 2297** See Lehoërff for a thorough description of the changes in bronze working from the twelfth to the eighth centuries (Lehoërff 2007).
- 2298** E.g. Snodgrass 1971, 229.
- 2299** Once there was a reservoir of iron tools and weapons, which could be reused, the devaluation of iron became inevitable (Nijboer 1998, 230–235). There is no evidence for hoarding of just iron.
- 2300** Tamburini 1995, 209–21, 354–62; Bartoloni 1989, 110–11.

- 2301** Giardino and Gigante 1995; Nijboer 1998, 268–70. The imports at Gran Carro are predominantly metals. The economy at the site was based on the exploitation and processing of nearby resources with little direct communication, although culturally the site appears to be related to the Latial *koinè* (Tamburini 1995, 353–62). The economy at Gran Carro was primarily self-supporting.
- 2302** See chapters 25 Zifferero and 26 Corretti.
- 2303** Giardino 1995, 119–33.
- 2304** Bartoloni 1989, 188; 1991, 20; Giardino 1995, 40–62. See chapters 25 Zifferero and 26 Corretti.
- 2305** For example, chamber Tomb PPG 7 dates to the first half of the eighth century. Though robbed, it is associated with imports such as some multi-colored glass beads and silver (Bartoloni et al. 2005).
- 2306** Hartmann 1985, 292.
- 2307** E.g. Nijboer 2008, 444–5.
- 2308** Iaia 2005, especially 221–70.
- 2309** However, see now for Veii, Boitani, Neri and Biagi 2009.

- 2344** Kristiansen 1993.

2345 von Hase 1989.

2346 Camporeale 2007; see [chapter 40](#) Iaia.

2347 Lo Schiavo 1994; Bartoloni 1997; Lo Schiavo 2002; Milletti 2012, 206.

2348 Milletti 2012, 209.

2349 Lo Schiavo 2000. Dating of Nuragic boats to the Early Iron Age Phase 2, at the latest, is proved by the Falda della Guardiola hoard (Populonia) (Bianco Peroni 1970, n. 270; Lo Schiavo 2000, 143) and the recently discovered tomb 74 in the necropolis of Monte Vetrano, in southern Campania, dating to the third quarter of the eighth century (Iannelli 2011). According to some authors, finds in later contexts (in burials of the Orientalizing period at Vetulonia and in Greek sanctuaries in southern Italy) could well be “heirlooms,” preserved through many generations until they were eventually deposited in a burial or votive context: e.g. Lo Schiavo 2000, 2002; Milletti 2012.

2350 Lo Schiavo 1978, 2002; Gras 1980; Milletti 2012.

- 2351** Lo Schiavo 2008, with references.
- 2352** Ialongo 2010.
- 2353** Lo Schiavo 2000. Conversely, there is no need to refer Nuragic imports in Italy to Phoenician mediation (e.g. Gastaldi 1994; Cygielman and Pagnini 2002). A Nuragic-Phoenician “partnership” based on the procurement of metals is argued, on different grounds, in Botto 2007, 81.
- 2354** Ialongo 2010.
- 2355** Delpino 2002; Ialongo 2010.
- 2356** Delpino 2002; Camporeale 2007; Lo Schiavo 2008.
- 2357** Cygielman and Pagnini 2002.
- 2358** Camporeale 2007, 40. This aspect can be further highlighted by the pan-Mediterranean distribution of askoid jugs, from Iberia and northern Africa (Carthage) to Crete via Sicily (Lo Schiavo 2008, 433, fig. 13), which could indicate a pattern of mobility of Nuragic groups along a route connecting the eastern and western Mediterranean.
- 2359** Delpino 2002.
- 2360** Falconi Amorelli 1966.
- 2361** Lo Schiavo 1994; Bartoloni 1989.

- 2506** Cristofani 1975, 1984.
- 2507** Bartoloni 1988. Further literature in d’Agostino 2011, 38.
- 2508** Respectively *TLE* 155 = *ET*, Ta 6.1 (from Tarquinii) and *TLE* 761 (provenance unknown, presumably Caere, now in the collection of New York University: Bonfante 2005). The mentioned interpretations are respectively by Mario Torelli, quoted in Torelli 2000, 146 and Jonathan Hall (2007, 257). For further examples of geographic mobility between Etruria and Latium vetus see [chapter 79](#) Naso.
- 2509** See the various aspects listed in Richard 1990, with previous bibliography.
- 2510** Linington 1980, 19–25 (periods 2–4). According to Giovanni Colonna, Linington’s period 2 corresponds to the Early Orientalizing (730–670), period 3 to the Middle Orientalizing (670–640/630), and period 4 to the Late Orientalizing (640/630–580): Colonna and von Hase 1984, 19–25.
- 2511** Bagnasco Gianni 2002, 621–23 lists the published tomb groups from B(anditaccia) L(aghetto).
- 2512** On the cemetery of Pontecagnano, still unpublished as whole (more than 10, 000 graves!), see Cuzzo 2007, 230–39, with previous bibliography. For the Daunian and Picenian finds: Cinquantaquattro and Cuzzo 2002; 2003.
- 2513** On the Regolini-Galassi chamber tomb, see Colonna and Di Paolo 1997, 154–63; about the Banditella 2 at Marsiliana: Cianferoni 1988.
- 2514** Pontecagnano: Cuzzo 2003, 112 no. 25; Marsiliana: Cianferoni 1988, 103–4 nos. 19–20 (might no. 18 be a spatula for wool working?); Caere: Pareti 1947, 217 no. 150. On the importance of wool working in Etruscan society see Torelli 1997; on woolen items, see [chapter 29](#) Gleba.
- 2515** See chapters 53 Amann and 59 Amann.
- 2516** Colonna 2002, 354–55 with previous literature (eleven inscriptions at all, including one from Pontecagnano with the term *thina* not entirely preserved); Bruni 2007 (a further inscription on a trade amphora dating to the sixth century). See also Menichetti 2002 and [chapter 13](#) Kistler.
- 2517** Colonna 1993. The inscription is not surely authentic.
- 2518** See chapters 29 Gleba and 48 Trocchi.
- 2519** von Eles 2002, 235–72, esp. 268–72.
- 2520** For a detailed description of the *tintinnabulum* see [chapter 29](#) Gleba.
- 2521** Rathje 2007, 177.
- 2522** See [chapter 19](#) Naso.
- 2523** For the chariots see [chapter 24](#) Emiliozzi; for helmets: Iaia 2005, 45–112; for shields, Bartoloni and De Santis 1995; for fans, Guldager Bilde 1994; for parasols, Miller 1992 and Simpson 2014.
- 2524** Delpino 2000 for the literacy tradition and the archaeological finds. See [chapter 9](#) Tagliamonte.
- 2525** One scepter has been identified, which was found in the tomb Monte Michele 5 at Veii (Boitani 2001, 115–16 no. 15). The few bronze thrones from Etruria are listed by Naso (2006a, 362–63). The term “queen” has recently been suggested for the women interred in some rich burials, such as No. 2 of the cemetery of Banditella at Marsiliana d’Albegna (Martelli 2008, 134 footnote 5) and the Regolini-Galassi Tomb at Caere (Colonna and Di Paolo 1997, 167; Martelli 2008, 135 footnote 16).
- 2526** For Verucchio, see [chapter 76](#) von Eles; for Chiusi: Minetti 2004, 446–49.

- 2527** Curtis 1925, 46 no. 82 (throne), 21 no. 18 pl. 4 nos. 3–4 (probable scepter), and 36–37 no. 72 (cult wagon). The tomb contained several ivory items (22 no. 20, 36 no. 71) as well.
- 2528** Naso 2006b, with previous literature.
- 2529** On haruspicy see [chapter 20](#) Rollinger.
- 2530** See [chapter 48](#) Trocchi.
- 2531** Naso 2012.
- 2532** See for instance Volterra 1997.
- 2533** Prayon 1975.
- 2534** Mengarelli 1927, 169.
- 2535** Almagro Gorbea et al. 2011.
- 2536** According to the Old Testament (OT, 2 Chron. 2:13–14), at Tyre a single craftsman was able to work in several types of metals, timber, stone, textiles, and more (Pedrazzi 2011).
- 2537** The burial is dated to the late eighth century and was placed with female grave 872 in the middle of a larger group of burials related to a single unit (Drago Troccoli 2005).
- 2538** Bartoloni 2003. The interpretation of these crested helmets—which were also present in Verucchio— as priestly marks, is not unanimous. It can be an emphasis on the symbolic item value in order to glorify the warrior role during social ceremonies (von Eles 2002).
- 2539** Dated back between the end of the eighth and the beginning of the seventh century. We observe the closeness to the rich contemporary female grave Lippi 47 (von Eles 2002).
- 2540** Torelli 1997a.
- 2541** The same elements of priestly dignity, military role and political status are to be noticed in both examples as in the late previous stage in leading burials.
- 2542** A scepter, footrest and throne.
- 2543** Naso 2016.
- 2544** Zifferero 1991
- 2545** See d’Agostino 1996.
- 2546** The display of the deceased corresponds to that of the *prothesis* in Greece (d’Agostino 1996; Bartoloni 2003).
- 2547** Bartoloni 2000. That might have been the function of the terraced altars in some mounds in northern Etruria and of the steps with top shelf in Caere; the steps in some access *dromos* in upper- class graves in Tarquinia might have had a similar role.
- 2548** Kruta Poppi 2010.
- 2549** Marchesi 2011.
- 2550** Colonna and von Hase 1984.

- 2551** Corresponding in Greece to the *ekphorà* (d'Agostino 1996; Bartoloni 2003).
- 2552** Colonna 1997.
- 2553** Bartoloni 2000.
- 2554** Colonna and Di Paolo 1997.
- 2555** von Eles 2002.
- 2556** For the wagon as ritual element linked with the Near East custom: Torelli 2006.
- 2557** Polyb. VI, 53. About the affinity of funeral processions with triumphal parades see Torelli 2008
- 2558** During this phase, the shields were carved in relief or painted in many upper-class graves especially in Caere (Naso 1996).
- 2559** Torelli 1997b.
- 2560** Torelli 1997b.
- 2561** Among these, the most famous ritual description is that in Virgil's *Aeneid*, in which funeral ceremonies are celebrated in honor of Aeneas's father, Anchises (Verg. *Aen.* 5, 577–593).
- 2562** The same iconography can be found in one of the represented scenes on the oinochoe from Tragliatella, dated to 620 (Menichetti 1994) (Fig. 16.4).
- 2563** Delpino 2000.
- 2564** The first Euboean wine cups, or their local copies, were already an example in the second half of eighth century, especially in south Etruria, above all in Veii necropolises (Nizzo and ten Kortenaar 2010 with previous literature), and in Etruscan Campania (d'Agostino 2006).
- 2565** Torelli 1997a.
- 2566** Bentini et al. 2015.
- 2567** Rastrelli 2000.
- 2568** Poli and Trocchi 2007.
- 2569** Dore 2007, with previous literature.
- 2570** Mainly seen as worshiping tools (Bartoloni 2000). It has recently been suggested that for their axe shape they could represent a female version of status and power indications. This could show that these prerogatives were transmitted even in the female line (Torelli 2006).
- 2571** Boitani 2001, with previous literature.
- 2572** Esposito 2000.
- 2573** Torelli 2006.
- 2574** Iconography and sculptor are oriental, but the statues, holding the *lituus* and the scepter, have both symbolic local marks of power and social status oriental features.
- 2575** Colonna and von Hase 1984.
- 2576** Colonna and von Hase 1984.
- 2577** We have to observe ancestor figures even in the mourning statues in the *dromos* of the Pietrera mound at Vetulonia, and in the male figurines placed at the top of grave C mound at Casale Marittimo. The carved thrones in the “Tomba degli Scudi e delle Sedie” (Tomb of the Shields and of the Chairs) at Caere, dated to the beginning of the sixth century, have the same meaning (Bartoloni 2000).
- 2578** Rizzo 1989; Naso 1995.
- 2579** Boitani 2010.
- 2580** Menichetti 1994.
- 2581** Cianferoni 2007 with previous literature.
- 2582** With arms folded on her chest and pressing one hand to her breast while the other holds a small vase.
- 2583** See the raised handles with female figurines still spread in Chiusi and in Verucchio at this stage (Delpino 2007; Trocchi 2007a).
- 2584** The depiction of the fabrics manufacturing, as in the mentioned *tintinnabulum* in Bologna, is not related to the simple handmade manufacturing (Gentili 2003), but also to an aristocratic form of ceremony linked to the *mater familias* weaving role (von Eles 2002).

2585 Torelli 1997c.

2586 The environment is identified by the represented trees and animals around the main figurines.

2587 von Eles 2002.

2588 It would be particularly interesting the active women role in the ritual ceremonies administration.

2589 Trocchi 2007b. These *laminae* were attached to a fabric, which covered the cinerary on which they formed two identical and symmetrical scenes in a circular frame.

2590 Pacciarelli 2002.

2591 Bonghi Jovino 2008 with previous literature.

2592 The *lituus* is considered a symbol of political and religious power, and at the same time represents the prototype of the Etruscan *Auguri* typical worshipping tool.

2593 The building probably served at this stage both as a place of worship and assembly for a primitive kind of urban *curia* (Torelli 2006, with previous literature). A further interpretation considers the bronze items (axe, shield and *lituus*) as instruments originally used to inflict capital punishment (Tassi Scandone 2001). What is most interesting is why merely functionless objects were placed as offerings in a sacred place that was especially significant to the community, both from the religious and political perspective.

2594 The worship of female fertility goddesses has been suggested to have taken place during the previous stage as well.

2595 Colonna 2001 with previous literature.

2596 *Menerva* represents a very ancient form of worship, linked to fertility and oracular activities. It has been suggested that this goddess originated in the Latin and Faliscan areas and was then borrowed by Etruscan religion (Torelli 2000).

2597 Maggiani and Rizzo 2005.

2598 Similar to those of San Giovenale and Acquarossa.

2599 We refer also to the little *sacellum* in the aristocratic house court in Murlo—which shows the perpetuation of a strong aristocratic worship administration in northern Etruria—and to the *oikos* in Acqua Rossa (Sassatelli 2000 with bibliography) and in Veii Piazza d'Armi (Bartoloni, Acconcia, and ten Kortenaar 2005), both closely linked to aristocratic residences but at the same time perfectly included in the urban area.

2600 The votive depot in Tarquinia—whatever its interpretation—is also placed in a collective worship area and not in an upper class burial.

- 2601** For comments on the text, forwarded articles and discussion, I would like to thank Prof. A. Naso, Prof. S. Voutsaki, Prof. G. Bartoloni, Prof. A.M. Bietti Sestieri, Dr. A. de Santis, Dr. A. Rathje, Prof. A. Zifferero and my students. All dates given are BCE unless otherwise stated.
- 2602** E.g. Barker and Rasmussen 2000, 60–75, 117–20. I also consider the break between Late Orientalizing and Archaic periods around 580 somewhat contrived with respect to economy. Therefore I will occasionally refer to the first half of the sixth century in this chapter.
- 2603** See chapters 46 Micozzi and 47 Naso.
- 2604** This exercise in demographics merely reveals an order of magnitude. Density of population in the rising urban centers of Etruria requires a more detailed discussion that would stretch the purpose of this chapter. The estimate is based on number of tombs, selection criteria for burials, surveys and a couple of recent settlement excavations.
- 2605** Trigger 2003, 310–3, 397, 661–2.
- 2606** De Ligt 2008, 147–54.
- 2607** E.g. Barker and Rasmussen 2000, 193–199.
- 2608** Enei 1993.
- 2609** Potter 1979, 72–92; Perkins 1991. The data recording infill of the hinterland are more evident for the sixth century and later than for the seventh century.
- 2610** Enei 1993.
- 2611** E.g. Rizzo 1990.
- 2612** Barker and Rasmussen 2000, 197–8; Izzet 2007, 196–7.
- 2613** E.g. Bersani, Canalini, and Dragoni 2010.
- 2614** E.g. Nijboer 1998, 265–8, 272–7.
- 2615** E.g. Rendeli 1993; Izzet 2007, 189–207.
- 2616** Esposito 1999; Nijboer 2008, 444–5; see **chapter 71** Nielsen and Warden.
- 2617** Zifferero 1991b; 2002.
- 2618** See **chapter 72** Zifferero. Later, sanctuaries became “liminal” markers for larger, city-state frontiers, a trend that rose from around 600 onwards (e.g. Izzet 2007, 190–3). A comparable reading is given for Cortona (Fortunelli 2005).
- 2619** Minto 1921.
- 2620** Sciacca 2005, 123–45, 328–32, 431–40; Emiliozzi 1997, 320–2. See also Zifferero et al. 2009; 2011.
- 2621** In this sense Masiliana d’Albegna is like Verucchio (see **chapter 76** von Eles). It is probable that control over long-distance trade at key locations of the inland network resulted in display of wealth at some secondary sites as well.
- 2622** Nijboer 1998, 161–4; 265–8.
- 2623** Emiliozzi 1997, 319–29. See **chapter 24** Emiliozzi.
- 2624** Höckmann 2001, 228.
- 2625** See **chapter 22** Pomey.
- 2626** *Emporion*, gateway community, entrepôt and port of trade are used as synonyms here.
- 2627** Nijboer 1998, 48–50; 56–61.
- 2628** See **chapter 47** Naso. Patron-client relations and clan organization are used here as basic social principles of economic dependence and differentiation. They do not necessarily equal the socioeconomic conditions in Republican Rome.
- 2629** Ceremonies and feasts are reflected, for example, in the evidence from Murlo/Poggio Civitate, partially discussed in section 6; Nijboer 2012.
- 2630** See for notions on elite-sponsored production and corvée labor, Costin 1996 referring to the Inca civilization.

- 2634** Bound 1991, 229; Nijboer 1998, 316–7.
- 2635** Bound 1991, 203–11; Cristofani 1995, 131.

- 2636** Nijboer 1998, 297–338; 2006.
- 2637** Cascino 2008; Boitani, Neri, and Biagi 2009; Ambrosini and Belevi Marchesini 2010, 211.
- 2638** Gran-Aymerich 1993, 35.
- 2639** Nijboer 1998, chapter II.
- 2640** E.g. Micozzi 1994; Medori 2010; Neri 2010; Gabrielli 2010. The *impasto rosso* ceramic tradition is closely related to the early manufacture of tiles and other terracottas.
- 2641** For an impression of the considerable variability of pastes and ceramics in use during the Orientalizing period in the towns of Tarquinia and Caere, see: Bagnasco Gianni 2010; Bonghi Jovino and Chiaramonte Trere 1997, 160–89; Bonghi Jovino and Biagnasco Gianni 2001, 1–397; Cristofani 1992, 29–31, 107–87; 1993, 217–71, 319–21, 351–64, 367–476.
- 2642** See [chapter 71](#) Nielsens and Warden, for a general description and interpretation of the site; Nijboer 2012.
- 2643** Stopponi 1985, 149.
- 2644** For a report on the site see Phillips 1993. The drainage tubes are published in: Stopponi 1985, 127–8.
- 2645** It was erected with the Italic/Oscan foot as the principal measuring unit, and is the earliest example in central Italy of the employment of a measure for construction works (Nielsen 1987, 91–2; Nijboer 1998, 326–8).
- 2646** Nielsen 1987, 116–9; Winter 2009, 52–4.
- 2647** Nielsen 1993; Warden 1993; Nijboer 1998, 277–81.
- 2648** Cristofani 1975, 11–12.
- 2649** Tobey, Nielsen and Rowe 1986; Nijboer 1998, 164–71.
- 2650** Phillips 1993, 56.

2651 See for the concept of poly-functional workshops, Bonghi Jovino 1990, 44–54.

2652 E.g. Winter 2009.

2653 Less than 4% of the site was excavated; extrapolation leads to a figure of 1,200 buildings (Wikander 1993, 137–9). However, extrapolation often results in high figures, which are not confirmed by cross-cultural analysis. Often, too little terrain is allocated to open spaces and public use such as defense systems, roads, alleys, squares and even vegetable plots. Nonetheless, a considerable number of houses must have existed at Acquarossa around 600–550.

2654 Wikander 1993; Nijboer 1998, 161–4.

2655 Camporeale 1997; Nijboer 1998, 270–2.

2656 Camporeale 1985, 135; 1997.

2657 Camporeale 1985, 26–78; 1997.

2658 Trigger 2003, 153.

2659 The percentages given here and in the abstract of **chapter 43** rest mainly on those provided by Trigger 2003, 154–7, 313. I have adjusted his percentages somewhat because he examined early civilizations that can be compared better to Etruria around 500–400 than to Etruria around 600. Slavery may have existed but we have no data that suggests it was widespread during the Orientalizing period.

2660 See **chapter 30** Li Castro.

2661 For Poggio Civitate see, for example, Rathje 1993.

2662 See **chapter 47** Naso. A recent exhibition exemplifies these firm relations for Vetulonia and Verucchio (Cygielman, Spaziani and Rafanelli 2009).

2663 See now Zifferero et al. 2009; 2011.

2664 For instance, Bound noticed that the Etruscan amphorae from the Giglio shipwreck lack standardization in dimensions (Bound 1991, 203–8).

2665 Colonna 2006, 658. Type Py 5 amphorae appear to have had more uniform dimensions. In her catalogue, Rizzo published four Py 5 amphorae, which have matching measurements (Rizzo 1990, 122, 141, 146). Bouloumié suggests that some Etruscan amphorae contained 21 liters while others contained 7 liters (Bouloumié 1982, 3–10).

2666 Höckmann 2001, 243.

2667 Trigger 2003, 321–31.

2668 E.g. Cristofani 1984.

2669 Enei 1993.

I wish to thank Dr. Yvonne A. Mazurek for the English translation.

2670 See e.g. Colonna 2002.

2671 Naso 2006 with further bibliography; see also **chapter 87** Naso.

2672 Marchesini 2004; 2010.

2673 Cristofani 1988. Relations between Faliscans and Etruscans were recently discussed in De Lucia Brolli and Tabolli 2013, with references.

2674 Di Gennaro 2007.

2675 De Santis 2005.

2676 See most recently Attema, Di Gennaro, and Jarva 2013 with further bibliography.

2677 Micozzi 2014 with further references.

2678 Martelli 2008, 136 footnote 26.

2679 Also suggested by the new specimen from Monte dell'Oro: Rizzo 2006.

2680 Naso 2000, 169–70, 206.

2681 Torelli 2010.

2682 Bonomi Ponzi 2010, 165–73, with further references.

2683 Colonna 2001, 17–19.

2684 Cenciaglioli 2001; Colonna 2001; on the most ancient Paleoumbrian inscriptions see now Benelli 2008.

2685 Manconi 2010; Bruni, Costamagna, and Giorgi 2014; Manca and Weidig 2014.

2686 Lo Schiavo and Romualdi 2009, 143–93.

- 2687** Lo Schiavo and Romualdi 2009, 151–57, nos. 1, 7–8, 10, 26–27. The fragment with embossed lions n. 10, tav. XXXVI could perhaps be a part of the lid of a Vetulonian pyxis (e.g., Camporeale 2007, 4–6, pl. Ia-b), rather than a small shield.
- 2688** Lo Schiavo and Romualdi 2009, 19–141.
- 2689** Shefton 2009; 2014
- 2690** Lo Schiavo and Romualdi 2009, 63–66, nos. 38–42, figs. 20–21; Silvestrini and Sabbatini 2008, 149–50, no. 170 (Pitino); Bonomi Ponzi 2010, 170, fig. 13 (Terni).
- 2691** Martelli 2007.
- 2692** Silvestrini and Sabbatini 2008, 62 no. 11, 189–90 no. 229.
- 2693** Rocco 1999, 117–25; Martelli 2007.
- 2694** Sabbatini 2003; Silvestrini and Sabbatini 2008, 125–29 nos. 157–62.
- 2695** See [chapter 46](#) Micozzi. Most recently Martelli 2013.
- 2696** Silvestrini and Sabbatini 2008, 95–96, with references.
- 2697** Silvestrini and Sabbatini 2008, 181–83 no. 220.
- 2698** See, most recently: Lo Schiavo and Romualdi 2009, 71–74 no. 53 (R.M. Albanese Procelli).
- 2699** Naso 2000, 104, 126, 113, 117. Tomb 17 of Pitino is certainly a woman's grave (Silvestrini and Sabbatini 2008, 143–44).
- 2700** Egg 1999; Naso 2007; Silvestrini and Sabbatini 2008, 78–83 nos. 68, 75 (with composite calotte), 211–12 nos. 252–53 (*Buckelhelme*), with references.

- 2701** Principi 2000, 234 no. 263.
- 2702** Regarding this context in the relationship between the two sides, see Naso 2000, 168–79.

- 2773** Cristofani 1978, fig. 64.
- 2774** Harari 2014.
- 2775** Cristofani 1978, 100, fig. 65.
- 2776** Cristofani 1978, 154–55, figs. 124–25; cf. also Lulof 1996.
- 2777** Colonna 1996, 2000.
- 2778** Brendel 1995, 15: “Their style was ‘classical’... but it was not itself Greek.... It constitutes the only known case of a contemporary classical art apart from the Greek ... the western equivalent of the classical style.”
- 2779** Colonna 2000.
- 2780** Arist. [*Oec.*] 2.2.20i = 1349b; Polyaeus, *Strat.* 5.2.21; Ael. *VH* 1.20.
- 2781** Massa-Pairault 1992, 72–75.
- 2782** Harari forthcoming.
- 2783** Hor. *Epist.* 2.2.180; Ath. 1.28b, 15.700c; Quint. *Inst.* 12.10.1; Strabo 17.1.28.
- 2784** Nijboer 1998 collecting all workshop finds in central Italy; Bentz and Reusser 2008, 98–110 on Marzabotto.
- 2785** The various types of bronze artifacts described below can best be found in detailed scientific catalogs: Adam 1984; Bini, Caramella and Buccioli 1995; Jurgait 1999; Naso 2003.
- 2786** Frey 1992.
- 2787** Vorlauf 1997.
- 2788** Grassi 2000.
- 2789** Hostetter 1986; Testa 1989; Ambrosini 2002.
- 2790** Jurgait 1999, 259–62 no. 416.
- 2791** Höckmann 1982.
- 2792** Richardson 1983; Cristofani 1985.
- 2793** Cristofani and Martelli 1983.
- 2794** Zazoff 1968; Zwierlein-Diehl 2007, 81–97.
- 2795** Martelli 1985.
- 2796** Mayer-Prokop 1967; Thomson de Grummond 1982; the *CSE*, organized according to museum, is in progress; fundamental on the technology is Zimmer 1995.

2797 So far there has been no comprehensive work on the bucchero of the sixth century; cf. most recently the conferences reported by Bonghi Jovino 1993 and Naso 2004; see also now the catalogue by Perkins 2007 with bibliography; new typologies by Tamburini 2004 and Capponi and Ortenzi 2006.

2798 Overview, Martelli 1987; for the later Etrusco-Corinthian vases, Szilágyi 1998. Supplements on the work of the black-figure painters in Gaultier 1995, 2003.

2799 Overview by Bellelli 2010 and Bellelli 2011.

2800 Most recently Winter 2009.

- 2801** Jannot 1984; most recent overview by Camporeale 2007.
- 2802** Briguet 1989.
- 2803** On Porsenna see among others Di Fazio 2000. See also Menichetti 1994, 90–117.
- 2804** Steingraber 1985, 24.
- 2805** Fundamental: Jannot 1984, which deals with about 275 monuments. Cf. d’Agostino 1989. Attic influence is obvious.
- 2806** For Orvieto see in general Colonna 1985; 2003b, stressing the absence of an aristocracy in the Orientalizing period. On the necropolises: Bonamici, Stopponi, and Tamburini 1994; Feruglio 2003. Architectonic forerunners of the chamber tomb type are found in Caere.
- 2807** Traces of wall painting from the fifth century are found in cemeteries of the territory (mainly architectural wall paintings, but see also the painted tomb of Grotte di Santo Stefano). On the tombs of Settecimini and Porano see summarily Steingraber 2006, 211–15.
- 2808** See most recently Sassatelli and Govi 2007; Govi 2015.
- 2809** See chapters 12 Amann, 70 Zifferero, 71 Nielsen and Warden.
- 2810** On the wall paintings at Tarquinia see among others Steingraber 1985; Moltesen and Weber-Lehmann 1992; Steingraber 2006.
- 2811** Famous exceptions with more chambers are, for example, the Tomb of the Bulls, the Bartoccini Tomb, and the Tomb of Hunting and Fishing. Cf. the tomb plans in Steingraber 1985, 386.
- 2812** Steingraber 1985, 314, no. 74. Massa-Pairault 2000, 259: “sodalizio, sede di un *collegium mercatorum*” [association, seat of a *collegium mercatorum*].
- 2813** See among others de Marinis 1961; Weber-Lehmann 1985; Amann 2000; Cerchiai and d’Agostino 2004; Amann 2016.
- 2814** Steingraber 1985, 355, no. 124: ca. 500 BCE.
- 2815** For the problem see d’Agostino 1990, esp. 63–69; Adam and Rouveret 1990.
- 2816** Jannot 1984, 382–86. Alongside heroic individual combat, hoplites standing in a row are also known (e.g. a base from Poggio Gaiella, Palermo, Jannot 1984, A.2, fig. 65; d’Agostino 1990, 79). Weapon dances likewise belong to the pictorial repertoire. For the unique sarcophagus from the Sperandio necropolis of Perugia, which shows persons armed with spears (Jannot 1984, C.I.1b, figs. 158–59), see most recently Cherici 2002, 101–3. The question of weapons as grave goods also arises here. Fragmentary fighting scenes on horseback show paintings in the Paolozzi Tomb: Steingraber 1985, 271, no. 21.
- 2817** Colonna 2003b, 137; Camporeale 2003, 156–62, figs. 1–3; Maggiani 2005.
- 2818** Magi 1932, esp. 40–43. See now Perazzi et. al. 2016; Amann forthcoming.
- 2819** According to d’Agostino 1990, 82, there could be some indication that a military class was emerging, but he stresses that evidence is very scanty.
- 2820** According to the tradition (Livy 1.43; Dion. Hal. *Ant. Rom.* 4.6ff.), the *comitia centuriata*, based on the hoplite army, were introduced to Rome under King Servius Tullius, thus around the middle of the sixth century. The reliability of the ancient sources, however, is very much under discussion. For armor in ancient Italy see in general Stary 1981.
- 2821** All in all the deposit included nearly 150 bronze helmets. Martelli 1995, no. 22; *CIE* 3.4.12023–78; Maggiani 2012. Cf. on this question also Dion. Hal. *Ant. Rom.* 9.5.4, who on the occasion of a campaign in 480 speaks of “the powerful, the wealthy,” and their “dependents” (*penestai*) in the Etruscan army (see [chapter 59](#) Amann).
- 2822** Sassatelli and Govi 2007, esp. 77, 83.
- 2823** d’Agostino 1990, 78. According to Torelli 1987, 45, he did not belong to the aristocratic-gentilicial class. For other hoplite and warrior graves see Adam and Rouveret 1990, 345–46.
- 2824** Colonna 2003a. On the stela of *Vel Kaikna* in Felsina depicting a ship see Sassatelli and Govi 2007, 73 ([Fig. 61.1](#)).
- 2825** For the building see Donati 1994.
- 2826** An open-air banquet that separates male from female participants decorates the walls of the Tomb of the Funeral Couch (460–450 BCE) in Tarquinia; this extraordinary representation

is probably to be explained on the basis of special cult requirements. Most recently Scala 1997.

2827 So e.g. in the Tomba delle Bighe (Tomb of the Chariots) at Tarquinia: Steingraber 1985, 289–91, no. 47. On the tomb, most recently Benassai 2001.

2828 On the not very numerous illustrated mirrors of the sixth and fifth centuries, see along with the volumes of the *CSE* the fundamental compilations of Mayer-Prokop 1967 and Pfister-Roesgen 1975.

2829 See d'Agostino 1993, esp. 68; Amann 2000, esp. 210. Cf. also Nielsen 1998.

2830 For the interpretation of these banquet scenes, see the summary in Amann 2000, 138–41. For the interpretation of the pictorial world of the Etrusco-Latial terra-cotta plaques see in general: d'Agostino 1991; Torelli 1992; Menichetti 1994, 93–102.

2831 In only four examples is there a woman's name over the entrance to the tomb: *ET*² Vs 1.37, 1.66, 1.85, 1.112 and 1.94 (*cippus*). Cf. Amann 2000, 116–17.

2832 Readings and interpretations of this inscription differ (1st half of the 6th century), see *ET*² Ve 3.13; Amann 2000, 115; Maras 2009, 413, Ve do.8: *venalia(s)* (female *praenomen* or divine name). For the whole complex of inscriptions, see Maras 2009, 405–427.

2833 Maras 2009, 208–9: Ve do.8, Py do.2, Py do 3–4 (?). On the new inscription from Orvieto, Campo della Fiera, see below footnote 52.

2834 See Krauskopf 2012 with reference to the terra-cotta frieze from Murlo. The situation is somewhat better in the Late Etruscan period. Cf. **chapter 59** Amann.

2835 Steingraber 1985, 293–94, no. 50.

2836 This is the oldest banquet scene with *klinai* in Tarquinia. Weber-Lehmann 1985, 42–44; Steingraber 1985, 286–87, no. 45; Amann 2000, 151–52. The four-chamber grave is bigger than contemporary graves usually are.

2837 The wife seated on her own chair plays a role as pictorial motif in the imagery of the grave stelae from Fiesole as well: Magi 1932, 46, no. 16; Magi 1933; de Marinis 1961, 30, no. 91–92. Stele from Trivignoli and stele bought at Sansepolcro: Amann 2000, 174–75; Amann forthcoming.

2838 On this question see Amann 2000, 109–14, 154–55, 164. On women in Etruscan tomb painting see most recently Scheffer 2007.

2839 Steingraber 1985, 316–17, no. 77 and 289–91, no. 47.

2840 See d'Agostino 1989, 3–4; 1993, 68–69. See in general Jannot 1984, 368–73.

2841 This is certain for a relief in Chiusi dating ca. 490 BCE: Jannot 1984, 60, C. I.30, fig. 203, cf. also 377, 380. Possibly also relating to a marriage context are a relief in Rome/Museo Barracco (Jannot 1984, 91, C. III. 3, fig. 319) and one in Copenhagen/Ny Carlsberg Glyptotek (Jannot 1984, 82, C. II. 35, fig. 295).

2842 Jannot 1984, esp. 362–68. The banquets with female participants, attested especially between 490/80 and 470 BCE and altogether not frequent, provide the opportunity for discussion of the status of the women depicted (wives, courtesans). Cf. Amann 2000, 171–73.

2843 Steingraber 1985, nos. 15, 17, 18, 22, 24.

2844 E. Govi in Sassatelli and Govi 2007, esp. 83, 91 (stela no. 169 is an exception). For the journey to the underworld, cf. in Tarquinia the Tomb of the Blue Demons (probably last quarter of the fifth century), discovered only in 1985: Adinolfi, Carmagnola and Cataldi 2005.

2845 See the summary in Amann 2000, 141–44.

2846 Cristofani 1996, 49–57; Torelli 2004. For Sostratos see also Hdt. 4.152.

2847 Most recently Maggiani 2006, who also deals with the interesting finds from Murlo.

2848 Due to the morphology of the Etruscan *nomen gentile*, early examples do not have a unique interpretation, such as *Rutile Hipocrates* (*ET*² Ta 6.1, “Rutile of Hippocrates” or “Rutile Hipocrates”). Cf. also *larθaia telicles* (*ET*² OA 2.2): de Simone 1968–1970, II, 228; Colonna 1975, 189. The number of genuine Etruscan *gentilicia* derived from Greek personal names, however, is quite limited; see de Simone 1968–1970, II, 251.

2849 See e.g. Musti 1987, 140–45.

2850 See Reed 2003.

- 2851** Amphora from the Praxias group with two Greek labels painted in the Chalcidian alphabet. de Simone (1968–1970, II, 231–32, 242, 265) interprets *arnthe* as the name of the vase owner; differently Colonna 1975, 188–89, establishes a connection between the two separate labels and recognizes them as a binomial Etruscan personal name. See also Colonna 2014, esp. 61 with reference to other recent opinions.
- 2852** Colonna 1975, 190 localizes the workshop of *metru*, who was educated in Athens, in Vulci (because of *-ce* instead of *-ke* in *menece*).
- 2853** For discussion of the status of Greek craftsmen in Etruria, see also de Simone 1968–1970a, II, 259–68. Secure Greek slave names in Etruscan are rare in the sixth and fifth centuries, e.g. *tamum*? de Simone 1968–1970, II, 237, 265f.
- 2854** Stopponi 2009, 441–49; *ET*² Vs 3.12: *kanuta larecenās laute/nitha aranthia pinies puia turuce/thuschval marvethul faliath/ere*.
- 2855** All of the other approximately 150 *lautni* inscriptions belong to the Late Etruscan period. Fundamentally Rix 1963, 356–72; 1994, 96–111.
- 2856** See with various results among others Torelli 1987, 46–47; Marchesini 1997, 146–66; Maggiani 2005, 47.
- 2857** Of this opinion is Colonna 1975, 184–85 (“servo/autore delle pitture” [slave/creator of the paintings]), 186–88 (evidence for the use of slaves of local origin in the ceramics industry); Colonna 2014, 58–60. But cf. *ET*² Ta 7.12 with another reading.
- 2858** *ET*² Ve 2.7. Cf. Colonna 1990, 15–16.
- 2859** Torelli 2000, 280.
- 2860** Bonaudo 2004.
- 2861** Naso 2000; 2006.
- 2862** Möller 2000.

- 2890** Cresci and Viviani 1995, 146.

2891 Craddock 1984, 212.

2892 It may be that there were not sufficient timber resources at Elba to heat the furnaces to the correct temperature, as is addressed below.

2893 Martelli 1981a, 158.

2894 Sassatelli 1996, 109. See also Martelli 1981a, 158.

2895 Elban hematite in its raw form, dated to the sixth and fifth centuries, has also been found at Pisa and Genoa (Corretti and Taddei 2001, 254).

2896 Aranguren et al. 2004. The last phase of the site, which is best understood, dates to the first decades of the sixth century to the beginning of the fifth.

2897 Maggiani 2002, 169.

2898 Cristofani 1986, 123; Craddock 1984, 216; Cucini 1992.

2899 Diodorus's emphasis on currency may reflect his first-century BCE perspective, although some coinage may have been used. Note that Dicaearchia was not founded until ca. 530 BCE (Hegesander *FHG* 4, 421 fr. 44; Steph. Byz. s.v. Dicaearchia; Strabo 5.4.6; Ciampoltrini and Firmati 2002, 35).

2900 Ciampoltrini and Firmati 2002; Aranguren, Ciampoltrini, Cortesi, et al. 2004, 328–30. It is possible that Fonteblanda may be one of the alternate trading centers to which Diodorus refers. Fonteblanda was occupied for a few decades from the late sixth to the early fifth century.

- 3060** Coen 2005, with references.
- 3061** Coen 2007.
- 3062** Martelli 2000 and Hansson 2014 about Etruscan glyptic. Ambrosini 2011a for inscripted scarabs in Etruria.
- 3063** For the depiction of the artisans on Etruscan-Italic gems see Ambrosini 2014c.
- 3064** Hansson 2005, 142.
- 3065** For example, there was a gradual decline in the presence of Greeks at the so-called *emporion*- sanctuaries as well as in imported Attic ceramics, which also holds for the number of painted chamber tombs in Tarquinia in the second half of the century. See among others Colonna 1990, 7–9, 18.
- 3066** On these regions, which are not very well known, see Maggiani 1990. On Greek ceramics in Etruria, see also Reusser 2002 and [chapter 56](#) Reusser.
- 3067** In the late sixth and first half of the fifth centuries, these small centers had been considerably curtailed by the urban centers. Colonna 1990, 12, 17; Torelli 1990, 193; 1995, 114.
- 3068** On the great *gentes* of the south Etruscan city-states see Morandi Tarabella 2004. On the epigraphic evidence for the Cilnii see Maggiani 1988.
- 3069** Morandi Tarabella 2004, 625, 636–37 and 627–28, 635. Additional examples there.
- 3070** On southern Etruria generally, see Morandi Tarabella 2004, on Tarquinia also Chiesa 2005. For Chiusi most recently Benelli 2009.
- 3071** The original is lost; the text is known only from a sixteenth-century copy. Maggiani 1988, 176–77; Steinbauer 1998; Agostiniani and Giannechini 2002; Morandi Tarabella 2004, 129–31.
- 3072** Quelling of a *bellum servile*: Torelli 1975, 41, 80–81. Cf. footnote 38 below.
- 3073** Most recently Bourdin 2007 with a summary of scholarly opinion on the Celtic invasion of 391/387 BCE.
- 3074** For these see Steingraber 1985.
- 3075** Oleson 1982; Maggiani 1994; Barbieri 2010.
- 3076** Malitz 1983, 87. Whether 5.40.4 should be seen as an interpolation by Diodorus is controversial.
- 3077** See among others Broise and Jolivet 1997.
- 3078** On the necropolis see most recently Chiesa 2005, 89–187, esp. 254–257. On the Anina tomb: Steingraber 1985, 67, 282, no. 40.
- 3079** The evidence is especially rich in Hellenistic Chiusi, but even here there are no systematically excavated necropolises. The number of documented burials increases tenfold with the beginning of the third century. See Cristofani 1977, 77–78; Berrendonner 2007.
- 3080** See most recently Benelli 2009, 157–58.
- 3081** In general see Cristofani 1986, 151–52. On the Tabula Cortonensis among others Agostiniani and Nicosia 2000; Pandolfini and Maggiani 2002. Summary of the interpretations in Amann 2005.
- 3082** In all, about 6000 chamber tombs have been excavated by the Fondazione Lerici, of which a not precisely specifiable, but in any case significant, number belongs to the Late

Etruscan period. See among others Cavagnaro Vanoni 1996, 19–21; Serra Ridgway 1996; Chiesa 2005. About thirty-four painted tombs belong to the period between the mid fourth century and the second half of the second: Steingraber 1985, 58.

3083 Colonna 1990, 13–14. For Castel d’Asso see Colonna di Paolo and Colonna 1970.

3084 The tomb owners could have been clients or a distant branch of the powerful patrician *gens* Claudia in Rome. Most recently Morandi Tarabella 2004, 132–35.

3085 On the character of these *foedera* see the still fundamental Harris 1971, 85–113.

3086 See among others Heurgon 1959; Harris 1971, 121–23; Cristofani 1986, 145–46; Torelli 1995, 104–5. Most recently Mastrocinque 1996, 252, who takes them to be slaves in the possession of the state (“*servi pubblici*”) from the native population. Massa-Pairault 2000, 262–63. Mostly the right of “slaves” to hold private property is emphasized as an Etruscan peculiarity.

3087 These represent autochthonous population groups defeated by conquerors (with varying legal positions), whereas especially Dionysius of Halicarnassus (1.30.2) vehemently supported the autochthony of the Etruscans as a whole.

3088 Benelli 1996, 340. In this sense also Cristofani 1995, 83. Cf. Dion. Hal. 2.9.2 for the introduction of the patronage system by Romulus: The Thessalians would have called their *pelátai* by the pejorative term *penéstai*.

3089 Examples collected by E. Benelli, in *ThLE* 12, 2009, 119.

3090 As already excluded by Rix 1963, 371 footnote 165. But see also Torelli 1987, 90–91: “classe dei servi”; Mastrocinque 1996, 255–59; Massa-Pairault 2000, 264–65: „*clientes*”; Facchetti 2002: “semiliberi dotati di una (seppur limitata) capacità giuridica,” “plebeo, cliente, vassallo.”

3091 See already Olzschka 1968, 222; Rix 1977, 65–66; Maggiani 1996, 117–23, esp. 119–20: “membro della *iuventus*.” *Camθi* might correspond to Latin *camillus* in the sense of “(highborn young) cult servant.”

3092 Benelli 2003, 220. The construction *lautn eteri* known from Perugia and Chiusi remains difficult to explain.

3093 Rix 1963, 372.

3094 Steingraber 1985, 278, no. 32. Most recently Massa-Pairault 2000, 263.

3095 *ET*² Vs 7.11–12. Rix 1963, 274; de Simone 1968–1970, II, 96, 143. The individual names that seem to be typical for slaves are seen as decisive. Most recently Morandi Tarabella 2004, 350, 363–64.

3096 Rix’s (1994, 111–16) proposal to see *lautni(tha)* not as “the one who belongs to the family/gens”, but as “who belongs to the community of the free (= the people)” does not seem to me convincing, since the *lautni* was free in regard to his own person, but as a rule had no political rights.

3097 About 150 examples, collected in Rix 1963, 356–72, and 1994, 100–106; *ThLE* 12, 2005, 237–38. Rix interprets the differences in the formulas historically (before or after 90 BCE), but there also might have been different forms of manumission. On the Late Archaic inscription from the Campo della Fiera sanctuary nearby Orvieto (*ET*² Vs 3.12) see [chapter 53](#) Amann.

3098 See also de Simone 1968–1970, II, 259–68. It’s of course possible that especially Greek names were “in vogue” for slaves.

3099 *REE* 56, 1991, 364–66, no. 82 (E. Benelli). On dedications from the lower classes: Maras 2009, 210–11.

3100 E.g. *ET*² Vs 3.12; CI 1.1179; CI 1.1459; CI 1.1565; CI 1.768; CI 1.777. Rix 1994, 99.

- 3101** Livy 10.3.2 speaks only of unrest, 10.5.13 defines it more clearly: *Cilnio genere cum plebe in gratiam reducto*. Cf. also the *cetera multitudo* in contrast to the 470 *ditissimi* in the case of the Etruscan city of *Troilum* (Livy 10.46.10–12: 293 BCE).
- 3102** Interpreted as two different events by Torelli 1975, 80–81; Maggiani 1988, 187. Contra Steinbauer 1998, 273–76.
- 3103** See among others Harris 1971, 115–17; Torelli 1987, 91–92; Benelli 1996, 342–43. On the revolt of “Oinaréa” (*Mir. ausc.* 94) see Harris 1971, 118.
- 3104** On the industrial quarters, see most recently Bonamici 2007.
- 3105** Romualdi and Amadasi 2007. The burial chamber itself had been completely looted.
- 3106** Meiser 2009, 147–50. The suggestions by Rix 1963, 372–78, and 1977, 67, regarding the enrollment of formerly discriminated Italics (called *penéstai*) in the citizenry of Chiusi in the Hellenistic period were based on incorrect archaeological assumptions and should be disregarded; see the criticism in Benelli 2011.
- 3107** Benelli 2002. On the territorial expansion of Perugia see Amann 2011, 150–58.
- 3108** For these women, see Haynes 2000, 287–89, 336–39; Swaddling and Prag 2002. For Larthi Cilnei see footnote 7 above.
- 3109** On the passage, see Amann 1999.
- 3110** Probably similar to the form of marriage *sine manu* in Late Republican Rome, as convincingly argued in Nielsen 1989, 85.
- 3111** Haynes 2000, 357; *ET*² Vt 3.3. Emphasis on the deceased as mother is already found on the large figural cinerary urns from Chiusi and territory, which were used by the aristocratic upper class beginning in the second quarter of the fifth century: Cristofani 1975, 39, no. 7 (so-called “Mater Matuta” from Chianciano).
- 3112** Steingräber 1985, 344, no. 111; Chiesa 2005, 257–258: second half of the third century.
- 3113** See the compilation in Maras 2009, 209–10.
- 3114** *ET*² Co 3.3–4. Completion as either *v(elia)* (so recently Maras 2009, 256–258), or *v(el) cvinti* (so Benelli 2007, 220) is possible.
- 3115** See Nielsen 1990, also on the Tomb of the Inscriptions in Vulci. Most recently Lundeen 2008, recognizing in *hatrencu*—not convincingly—a civic title.
- 3116** *ET*² Pe 1.852–1.855, second century. A priesthood inherited through the female line would be a theoretical possibility. On the phenomenon of the “women’s tombs” see Nielsen 1999.
- 3117** Comella 1981; 2004; Edlund-Berry 2004.
- 3118** MacIntosh Turfa 1986; 1994; 2004; Edlund-Berry 1987; Comella and Mele 2005; MacIntosh Turfa 2006.

- 3352** Calenian ceramics: Pagenstecher 1909, 44–48; Höckmann 1991, 208–10; Zimmermann 1995, 101–102; Kistler 2009, 230–31, 256, 275–82. Civitalba frieze: Bienkowski 1908, 93–104; Andrén 1939–1940, 301–308; Landolfi 1994, 81–84; Kistler 2009, 282–91; Holliday 2009; La Rocca and Parisi Presicce 2010, 249 (M.J. Strazzulla), with further bibliography.
- 3353** Polyb. 2.23.12–14 (transl. E.S. Shuckburgh).
- 3354** Brunt 1971, 44–60; Ilari 1974; Baronowski 1993.
- 3355** *Metus Gallicus*: see Bellen 1985; Grünewald 2001.
- 3356** For this interpretation, see de Angelis 2015, 188–91.
- 3357** Tomb of the Esquiline: La Rocca 1984; Coarelli 1990, 171–75; Holliday 2002, 83–91; Coarelli 2011, 156–60; 2012.
- 3358** Pfiffig 1966; Harris 1971, 129–44; Diana 1989.
- 3359** See Livy 27.21.6; 27.4; 27.38.6; 28.10.4–5; 29.13; 30.26.12. 68 External Relationships, 250–89 BCE
- 3360** Commercial, cultural, and even military relationships of the Etruscans with the Carthaginians are attested well before the Hellenistic period: see **chapter 88** Naso.
- 3361** Robinson 1964, 47–48; Baglione 1976; Catalli 1990, 112–13; Rutter 2001, 26 no. 69; Bergamini 2001, 86–88 nos. 94–99.
- 3362** Siege of Casilinum: Livy 23.17.8–11; 23.19.13–18. On the inscription of Laris Felsnas (ET Ta 1.107), see Sordi 1989–1990; Benelli 2007, 74–78.
- 3363** Hannestad 1993; Kremer 1994; Strobel 1994; Marszal 2000; Kistler 2009.
- 3364** The literature on this subject is vast and need not be listed here in full; see, most recently, Wallace-Hadrill 2008; La Rocca and Parisi Presicce 2010.
- 3365** Massa-Pairault 1973; 1975; Maggiani 1976, 22–27; Massa-Pairault 1977, 159–60; Maggiani 1985, 89–90; Papini 2004, 477–83. *Revixit ars*: the allusions are to the famous passage in Plin. *HN* 34.52 about the alleged “renaissance” of art in 156 BCE—which, however, refers to bronze sculpture alone (see Settis 1982, 189–91; *contra*, Coarelli 1996, 522–26).
- 3366** Massa-Pairault 1985, 202–205; Nielsen 1993, 342–45.
- 3367** See, e.g., Maggiani 1989. On the Etruscan relationship to Pergamene art, see also Dohrn 1961; Steingraber 2000. 68 External Relationships, 250–89 BCE
- 3368** See, on the attenuation of pathos (*Pathosdämpfung*) in portraiture, Giuliani 1986, 200–20; Fittschen 1991; Papini 2004, 472–73.
- 3369** On the Hellenizing tendencies of late Republican architecture in Rome, see, most recently, Gros 2009; La Rocca and D’Alessio 2011. On Hermorodos of Salamis, see especially Gros 1973; Zevi 1976; Tortorici 1988; La Rocca 2011, 8–14.
- 3370** Hellenistic marble monuments of northern Etruria: Bonamici 1985; 1991. On the use of marble in Etruria more generally, see especially Andrén 1967; Bonamici 1989; 1990; and, most recently, Maggiani 2004, 152–64 (with further bibliography).
- 3371** See Sordi 1960; Harris 1971, 45–47; Humbert 1972; Kaimio 1975, 95; Galsterer 1976, 70–84; Humbert 1978; Torelli 2000; Aigner-Foresti 2004, 224–27.
- 3372** See, on these phenomena, Harris 1971, 147–201, 319–28. On enfranchisements before the Social War, see Torelli 1969; 1982; Weber 1998.
- 3373** On the role of the Etruscans (and Umbrians) in the Social War, see Harris 1971, 202–29; with diverging evaluations, see Sordi 1988; Mouritsen 1998, 153–59; Cappelletti 2004. For the quotation from Appian, see *Civ.* 1.49.213.
- 3374** Particularly relevant for the Imperial-age memory of the Etruscans’ external relationships are the *elogia Tarquiniensia*: see Torelli 1974–1975; 1975; Gabba 1979. 68 External Relationships, 250–89 BCE

- 3463** Stopponi 2006; 2008.
- 3464** Ciacci 2004.
- 3465** For instance the kyathoi found at Gavorrano, part of a ceramic production also evident at Vetulonia and Poggio Civitate, which has been connected to Caere. Donati and Cappuccini 2007, 680, fig. 3. See also Tuck and Nielsen 2008, 49–66. For a complete discussion of this group of ceramics: Cappuccini 2007.
- 3466** Nielsen 1991; see esp. 252–53, n. 21.
- 3467** Steingraber 2001, 17.
- 3468** Mangani 1984; Mangani 1986, 94–98.
- 3469** Cristofani 1979, according to whom the city name, Siena, may have Etruscan origins from the elite family name Saina/Seina.
- 3470** For the dispersed archaeological evidence of this region: Mazzeschi 1976; Mangani 1986; Pistoi 1997.
- 3471** As set out, for instance by Stoddart 1990.
- 3472** For sanctuaries of this type: Zifferero 1995.
- 3473** Nielsen 2006, esp. 20–28.
- 3474** Standard references are Falchi 1891 and Cygielman 2000.
- 3475** Camporeale 1999. Among the many objects that document contact with the Eastern Mediterranean or Sardegna are: a *faïence* Bes figurine (second half of the eighth century) from Poggio alla Guardia; a seventh-century bronze *lebes* from the Circolo dei Lebeti that has strong stylistic connections to Anatolia or North Syria; and a seventh-century Nuragic boat-shaped “lamp” from the Circolo delle Tre Navicelle. Most recently for Nuragic *navicelle*, see Lo Schiavo on the Nuragic boat from the Tomba del Duce: Celuzza and Cianferoni 2010, cat. 3.39, 136–38, with bibliography. Also: Lo Schiavo and Milletti 2015, with previous bibliography.
- 3476** Phillips 1970, 15–16 and 18.
- 3477** G. Camporeale (in Celuzza 2009, 27) in speaking of bronze production during the Villanovan period mentions a variety of objects said to be of Etruscan manufacture recovered at Dodona, Samos, Delphi and Olympia. See [chapter 87](#) Naso.
- 3478** Camporeale 1967.
- 3479** Two of the best-preserved examples were most recently published by Celuzza and Cianferoni, 2010, 158, figs. 3.106–7.
- 3480** For recent publication of Orientalizing tomb groups: Cygielman 1997; Rafanelli and Cygielman 2002; Cygielman and Pagnini 2006.
- 3481** As argued elsewhere for Ceri: Colonna and von Hase 1984; and for Picenum: Warden 1994.

- 3482** Magness 2001, with bibliography.
- 3483** For early Roselle: Cygielman 2009.
- 3484** Cygielman 2009, 56.
- 3485** Cygielman 2009, 56.
- 3486** Cristofani 1975. See also Cristofani 1976, 38, no. 38.
- 3487** Cristofani and Martelli 1983, 142 and 282.
- 3488** Cygielman 2009, 57.
- 3489** E. Nielsen and K. Phillips, in Stopponi 1985, 68–69. For further thinking on the interpretation, Phillips 1993, 81–83.
- 3490** Phillips 1993, 80.
- 3491** Steingraber 2001.
- 3492** Donati 1998.
- 3493** See for instance Maggiani 2004: 151–52.
- 3494** Steingraber 2001.
- 3495** N. Winter, personal communication 2012.
- 3496** For instance the rich and varied assemblage of the Tomba dei Flabelli: Celuzza and Cianferoni 2010: 83–109. For the Tomba dei Carri: Celuzza and Cianferoni 2010: 110–14.
- 3497** For the industrial production at Populonia: Warden 1983. For an extensive discussion of the broader context of Etruscan mineral exploitation: *Atti Populonia*.
- 3498** Zifferero 2000 for funerary architecture at Populonia.
- 3499** For the architecture and other considerations: Romualdi 2002.
- 3500** For full consideration of this city, with bibliography: *Atti Volterra*. More recently, Camporeale and Maggiani 2009.

- 3501** Bonamici 2007, 220–21.
- 3502** Bonamici 2007; 2008.
- 3503** For the Cecina valley, especially in the later periods: Regoli and Terrenato 2000.
- 3504** Bruni 1999.
- 3505** Bruni 2004a, 18–63. See Bruni 2004b for the demography of the region.
- 3506** Bruni 2007, 226–29.
- 3507** For the Classical and Hellenistic Periods: Bruni 2009, 181–248. Also Regoli and Terrenato 2000. For Lucca: Zecchini 1999.
- 3508** Esposito 2007, 90–91.
- 3509** Esposito 2001; 2007, 90–95; Celuzza and Cianferoni 2010, 115–22.
- 3510** Esposito 2010, 123–24.
- 3511** Cristofani and Martelli 1983, 121–22 and 273–74.
- 3512** Tuck 2009.
- 3513** The best source for a review of the material still remains Stopponi 1985, 64–154; see also Phillips 1993.
- 3514** Edlund-Berry 1994. See also Tuck 2006
- 3515** Nielsen 1987; 1994. For a more recent and thorough discussion of the architectural terracottas from the site in the context of Etruscan architectural decoration see Winter 2009.
- 3516** Tuck and Nielsen 2000.
- 3517** Nielsen 1993.
- 3518** Tuck and Nielsen 2000, 35–63.
- 3519** Tuck and Nielsen 2008, 49–66.
- 3520** Winter 2009, 198–208.
- 3521** For a comprehensive discussion of the burials and their contents, Tuck 2009, especially 16–23 and 83–98. Nine simple fossa graves with inhumation burials have been uncovered to date. They are located on the hill adjacent to Poggio Civitate less than one kilometer northwest of Piano del Tesoro. The grave goods are mostly composed of local ceramics together with fibulae, and a scattering of bronze and iron weapons. Several examples of pottery contemporary with the elite gifts from the Tomba del Duce have been recognized. Chronologically, the Poggio Aguzzo material would seem to fit comfortably in the middle of the seventh century, providing some small overlap with the earliest pieces from the Orientalizing Complex on Poggio Civitate.
- 3522** For which see Warden 1983, and also: *Atti Populonia*.
- 3523** For the site, with previous bibliography: Camporeale 2010.
- 3524** For the settlement, see Camporeale, 1997; for tombs, Camporeale 2000. Also Camporeale and Giuntoli 2000.
- 3525** Minetti and Rastrelli 2001. For new data about Chiusi see Gastaldi 1998 and Chiusi 2000.
- 3526** For a complete discussion with excellent color photographs and full bibliography: Minetti 2006. For another painted tomb from this area: Rastrelli 2003, 94–99.
- 3527** Minetti 1997, 28.
- 3528** Vilucchi 2009.
- 3529** Scarpellini Testi 1995, 371.

- 3656** Cerchiai 2008a, 407–8, with bibliography.
- 3657** Pellegrino 2008. See also **chapter 18** Maras.
- 3658** *CIE* 8867–8868; Colonna 1998.
- 3659** Colonna 2005, 1763–71.
- 3660** The earliest attestation of this city name is in Hecataeus (Steph. Byz. s.v. *Nola*), at the end of the sixth century BCE.
- 3661** Greco Pontrandolfo 1980.
- 3662** Cerchiai 1996; Pellegrino 2014.
- 3663** Colonna 2005, 177–78; on the the bronze coins see Cantilena 2016.
- 3664** Cerchiai 2008b, 24–26.
- 3665** Beloch 1890, 1.
- 3666** The term “Campania” is derived from the adjective “Campanus,” which refers to the *ager* of the main city of the region, Capua.
- 3667** De Franciscis 1992.
- 3668** Beloch 1890, 379–386.
- 3669** For an overall picture on the ancient sources on Campania before the Romans, see Lepore 1978 and 1989, Martin 1984; Mele 1991 and Mele 2014b. On the Greek presence in Campania, see in particular: Mele 2014a.
- 3670** Recent researches have revealed the high consistency of the Opician settlement of Cuma (so called pre-Hellenic Kyme) before the colonization. Despite previous conjectures, the village would have spread outside the limits of the natural acropolis; see Greco 2009; for interpretation see d’Agostino 2011b.
- 3671** Recent analyses in Musti 2009; Mele 2010; Chiaramonte Treré 2011 and Colonna 2011. The sources are collected in Pagliara 2002.
- 3672** Bugno 2009; Cesarano 2011.
- 3673** Despite the name, ancient Capua corresponds to the modern city of Santa Maria Capua Vetere, not to be confused with the modern Capua.
- 3674** It has been argued, in particular, that in Ecataeus’ picture of Campania there is an open reticence in admitting the participation of the Etruscans in the peopling of the region: Colonna 1991, 26.
- 3675** Musti 1992. Strabo (5.4.3) in particular accounts for an Etruscan *dodecapolis* in Campania, similar to that of southern Etruria, of which Capua would have been the capital.
- 3676** Bellelli 2006, 119–20.
- 3677** Recent discussion in Musti 1992; Cerchiai 2010a, 31–2; d’Agostino 2011a, 77–78 and Sirano 2014a.
- 3678** Colonna 2005, 155–60.
- 3679** As stated by M. Cristofani (1997, 189) and M. Torelli (1994, 867).
- 3680** Bellelli 2006, 110–22.
- 3681** Beloch 1890, 339–421; Heurgon 1970; Frederiksen 1979 and 1984.
- 3682** His contributions on this matter are now usefully collected in one volume: Johannowsky 2010.
- 3683** Johannowsky 1965; 1983, 7–88.
- 3684** Cristofani 1987; Colonna 1991; Cerchiai 1995; 1999; 2008; 2010a; 2010b; 2011; Massa-Pairault 1996, 138–142; Bonghi Jovino 2000; d’Agostino 1996; 2001; 2011a; Pellegrino 2013a.
- 3685** Haynes 2000, 197–200; Camporeale 2011, 425–45; Cuozzo 2012.
- 3686** Szilágyi 1988; Kästner 2010.

- 3688** Bonghi Jovino 1965–2011; for bronze working see also Grassi 1996; 2000; Bellelli 2002a; Gilotta 2006.
- 3689** Benassai 2011; Cammarota 2000; 2001; 2003; Lyons 2007; Castaldo 2011.
- 3690** For an overall picture of the history of ancient Capua see Gilotta 2009; Melandri 2011c and Sirano 2013.
- 3691** Recent discussion in Bellelli 2006, 118–9, with references to previous literature.
- 3692** Occhilupo 2011; on the most ancient human presences in the area see Minoja and Raposso 1996 and Nava 2011. More generally, on the protohistory of northern Campania see the recent account in Albore Livadie 2014. Some new interesting data are now available thanks to the survey of Quilici Gigli 2012 in the Tifata area.
- 3693** Colonna 1991, 38.
- 3694** Melandri 2011a.
- 3695** Johannowsky 1983; Chiaramonte Treré 1999; Setti 2000; Colombo and Stanislao 2011; Melandri 2011a; Occhilupo 2011.
- 3696** Allegro and Santaniello 2008.
- 3697** Johannowsky 1994; 1996.
- 3698** Torelli 1981, 42; Colonna 1991, 36–40; Sirano 2014a.
- 3699** See in particular the comments of Colonna 1991, 36.
- 3700** Colonna 1991, 36–7.

- 3701** d'Agostino 2011b; 2014.
- 3702** d'Agostino 2014.
- 3703** Melandri 2011a; Bellelli 2012.
- 3704** Johannowsky 1989, 37; 1996, 64; Melandri 2011a; see also E. Santaniello, in Allegro and Santaniello 2008, 27. Prominent among the remarkable previous discussion on this crucial theme are therefore the provocative proposals by R. Peroni to dissolve the difference between Villanovan and *Fossakultur*: Peroni 1994; *Atti Roma-Napoli-Pompei* 2007, 859–60.
- 3705** d'Agostino 2011a, 73, pl. VIIa; Colombo and Stanislao 2011, 335, note 1, pl. IIIa–c; Melandri 2011a. See also the comments of M. Pacciarelli (2014, 53).
- 3706** This complex reminds us of the importance of an archaeological discovery of over a century ago—wrongly underestimated due to its sporadic nature—the discovery in the territory around Capua of a crested Villanovan bronze helmet now kept in New York: Bellelli 2006, 29, pl. VII:1.
- 3707** Gobbi 2011; Melandri 2011a; Melandri and Sirano 2016.
- 3708** Peserico 1995; Kourou 2005.
- 3709** De Salvia 2008; Melandri 2010 and 2011a; Melandri and Sirano 2016. As for the amber, see Grassi and Minoja 1998 and Borriello 2007.
- 3710** It has been recently the object of two important analyses, and opposing points of view: d'Agostino 2010, Melandri 2011b.
- 3711** Johannowsky 1989, 32.
- 3712** Johannowsky 1983, 298–9; 1989, 43; Minoja 2006a. For a general picture on this period: Minoja 2014; Melandri and Minoja, forthcoming.
- 3713** For a general picture see Albore Livadie 1985.
- 3714** Valenza 1969; Mingazzini 1969; Murolo 2003.
- 3715** Ferrante 2006 and 2007.
- 3716** On the class see Canciani 1974. On the Campanian productions, see Bellelli 2003a and 2011.
- 3717** Albore Livadie 1979; Rasmussen 1986; Minoja 2000.
- 3718** Cerchiai 2008; Gobbi 2012.
- 3719** Latium vetus, *ager faliscus*, Sabine and indigenous Campania all adopt bucchero: Naso 2004.
- 3720** Napolitano 2011.
- 3721** Johannowsky 1989, 44.
- 3722** Bellelli 2001.
- 3723** Bellelli 2003a.
- 3724** It is disputed whether this group of local vases can be considered, from a stylistic point of view, the output of a school working on Corinthian or Etrusco-Corinthian models: see Cerchiai 1990 and Szilágyi 1990.
- 3725** Johannowsky 1978.
- 3726** Minoja 2009.
- 3727** Cerchiai 1998.
- 3728** Cerchiai 1997b.
- 3729** Stibbe 2000; Bellelli 2006, 89–93.

3847 On the class, see Naso 2006.

3848 Cinquantaquattro 2007.

3849 Cinquantaquattro 2009, 140–42.

3850 The most recent and broadest account of the subjects remains Malnati and Manfredi 2003.

3851 The most recent and broadest account of the subjects remains Malnati and Manfredi 2003. To the bibliography given there, add, with extensive relevant bibliography at least: Sassatelli and Donati 2005; Locatelli and Malnati 2007; Ortalli 2008; Curina et alii 2010; Marchesi 2011.

3852 The most recent and broadest account of the subjects remains Malnati and Manfredi 2003: to the bibliography given there, add, with extensive relevant bibliography at least for Marzabotto: Vitali, Brizzolara and Lippolis 2001; Sassatelli and Govi 2005; Bentz and Reusser 2008; Sassatelli and Govi 2010. For Spina: Berti and Harari 2004. For western Emilia: Chiaramonte Treré 2009; Burgio, Campagnari and Malnati 2010. In general; Calastri et alii 2010.

3853 Recent bibliography and discussion in von Eles and Pacciarelli forthcoming. For relations with the Chiusi-Cetona group see also [chapter 76](#) von Eles.

3854 For a purely conventional, not ethnic, sense of the archaeological concept of ‘Picene civilization’ and of the adjective derived, see Baldelli 2000, 31–2, 35, with bibliography and discussion at notes 1–3, 27). The northern limit of such a group compared to the Verucchio group seems attested at Boncio (Baldelli 2001, 66; 2002b, 11–12), in the vicinity of Gradara; it is more difficult to identify a frontier in the successive phases (cf. Lollini 1985, 338–44, 353–54, 358, with comments of G. Colonna and P. von Eles, on which also Baldelli 2002a, 69, n. 2).

3855 The Italian expression ‘*teste di ponte*’ is Pallottino’s (1984, 56, 150), but used with reference to the overcoming of the Apennines by the single Emilian and Romagna nuclei, the first of which also as we now know (Bermond Montanari 1993), reaches the Adriatic at Argenta, not far from Spina. The analogy with the ‘outposts’ of Guillermo Algaze (1993) is evidenced by Guidi (2006, 60).

3856 Delivered for printing in February 2012; researches and excavations after this date have not been considered here; only recent studies on Verucchio and results of excavations in Verucchio, Pian del Monte, by Prof. Maurizio Harari (Pavia University) are briefly mentioned. For an updated general outlook of Romagna from Final Bronze Age to Iron Age and previous bibliography: von Eles and Pacciarelli forthcoming.

3857 For preliminary information on recent excavations and studies in Imola Pontesanto, Ca’ Borghese and Orto Granara and for a map of Iron Age sites von Eles et al. forthcoming; Giumlia-Mair and von Eles forthcoming.

3858 The significance of the bronze belt (Torelli 2000, 547, no. 26) has been underestimated: Marradi is not far from the cemetery of San Martino in Gattara.

3859 In the site (Casa della Musica, via Nanni), situated near the northern edge of the plateau, structures and stratigraphy strata and structures, unfortunately probably exposed for a long time and therefore very disturbed, refer to two separate chronologic horizons dating to Final Bronze Age and First Iron Age. Excavations are yet unpublished.

3860 Sestieri 1999; Vanzetti 1999; Zanini 2000; this facies is named *facies Chiusi Cetona* by Alessandro Zanini, while Alessandro Vanzetti (and Renato Peroni) preferred to indicate it as *facies di Pianello*.

3861 There are certainly remarkable affinities between the two centers but differences are also noteworthy: territorial strategies as well as rituals (presence or absence of inhumation graves) or typological comparisons. For Verucchio: Gentili 1987, Colonna 1987, 1993 (for a later synthesis of this point: Sassatelli 1996); for Fermo and references see [chapter 77](#) Baldelli.

3862 See, as an example, some pottery shapes (Bettini 2000, fig. 5, 5; 15).

3863 Gentili 1985; Cristofani 1995, 146–149. For bibliographic references to Verucchio up to 2012: von Eles 2012.

3864 Giumlia-Mair and von Eles forthcoming; Giumlia-Mair 2015, 137–153.

3865 Bartoloni 1986.

3866 From this point of view it is interesting to observe that in the ninth cent. BCE the *fibule serpeggianti*, which are a standard item in male graves Bologna as in Etruria, are completely

missing in Verucchio (von Eles 2015b).

3867 von Eles 2009; Bottazzi and Bigi 2008.

3868 This necropolis is named by Gentili “Lippi/Sotto la Rocca” (Gentili 2003); hereafter it will be named as “Lippi”, including parts formerly known as Podere Gardini, Podere Dolci and Proprietà Giovannini.

3869 The site was partially excavated before a parking area (Verucchio, via Nanni) was built. I wish to thank Michele Degli Esposti (Bologna) to whom I am in debt for following all the work and documentation and providing a first structural and stratigraphic interpretation.

3870 From unpublished data in Soprintendenza Archeologia dell’Emilia-Romagna archives.

3871 Gentili 1986.

3872 Gherardini (1917), Scarani (1961) and Gentili (1963): archive data in Bologna Soprintendenza finds prove beyond doubts that Pian del Monte was intensively occupied during Early Iron Age. Indirect proof is the early “practical” use for water supply of the deep pit (infra) at the center of the plateau. Recent research in the archives and deposits in Bologna Soprintendenza by Lisa Manzoli and Lorenza Ghini (Specialising Thesis at Bologna University) have demonstrated that the method adopted by Gentili in excavation in the *Campo Sportivo* did not follow stratigraphic units but layers of a pre-determined depth: a procedure that does not allow identification of structures and even less their chronological attribution. Particularly difficult is establishing a chronology for what Gentili calls *capanna A* and attributes to the ninth cent. BCE: apparently the relative “layers” were only seen but not excavated and nothing has been found in the deposits labelled as *Capanna A* or *Fondo di Capanna I*. In the event of a real continuity of structures a possible interpretation was advanced by von Eles, Miari and Romualdi 1997 (discussion in *Ocnus* 1999) later accepted by Luigi Malnati (Malnati 2008b) and recently confirmed by M. Harari’s excavations in Pian del Monte (Harari 2016; forthcoming). A recent partial review of references and archive data on Pian del Monte topography in Rondini and Zamboni 2016.

3873 von Eles, Miari and Romualdi 1997.

3874 Including the ritual deposition of bronze shields (Gentili 1969).

3875 Paus. 5.12.5.

3876 Colonna 1987; 1993. Here Colonna, recalling his previous 1987 work, considering the late chronology he assigns to the Olympia throne (late sixth or early fifth cent. BCE) does not exclude a connection with an Etruscan chief settled in Capua or Nola after the Etruscan expedition against Cuma (524 BCE), which in his opinion saw a leading role of Etruscans from Romagna. See also [chapter 87](#) Naso.

3877 A recent proposal has been advanced considering five phases in the chronological development of the necropoleis covering the period from the tenth to the decades around the middle of the seventh cent. BCE (von Eles 2015a).

3878 Maggiani 2000, 251.

3879 Among the most significant types that represent clear links with Tyrrhenian Etruria the helmet shaped urn lid in Lavatoio, Campo del Tesoro Grave 52 (Tamburini-Müller 2006, 157 with earlier bibliography; according to Cristiano Iaia (Iaia 2005, 112–114) this is a close imitation of a bronze helmet *tipo Tarquinia* dating to the early eighth cent. BCE. Again to Southern Etruria and/or Umbria (Terni) point several types of disk-shaped bar fibulae (*fibule con staffa a disco*).

3880 See the many types of *fibule ad arco ribassato e ingrossato* which all have clear parallels in Bologna and *fibule ad archi paralleli*, an exclusive Bologna type which is imitated, with technical differences, in Verucchio (von Eles 2015b).

3881 Bentini 2015.

3882 Bettini 2000, fig. 5, 3.

3883 Delpino 2000, figg. 9, 9.12.17–18, 20–21.

3884 The decoration scheme of the painted throne from the grave from Poggio Renzo, in Cristofani’s opinion dating to the second quarter of the seventh cent. BCE (Cristofani 1971, 25, fig. 7) could have some relations to Verucchio wooden thrones where the openwork wheel

- motive is recurrent; for a “religious” interpretation of this motive Ortalli 2011, 160, footnote 121.
- 3885** Mazzoli and Pozzi 2015, 94–95.
- 3886** Delpino believes that the development of Chiusi was related to control of trade connected to metallurgical activities (Delpino 2000, 94); Giumlia-Mair 2015.
- 3887** Cygielman, Spaziani and Rafanelli 2009.
- 3888** von Eles 2002, 118, nos. 135–140; von Eles and Marchesi 2015; on these European harnessing types see also D. Faccenna and M. Martelli 2005, 320 considering the possibility of direct contacts between central Europe and Verucchio; Naso 2011.

3933 Malnati 2006, 90.

3934 Some of the little bronze statuettes from Villa Ruffi have been attributed to northern Umbrian background: Romualdi 1987, with earlier bibliography.

3935 Pian del Monte until early fourth cent. BCE, Covignano up to the foundation of the Roman colony of Ariminum (269 BCE); von Eles, Miari and Romualdi 1997.

3936 Most recently, in general and with rich bibliography, Baldelli 2000c; Baldelli et al. 2003. The history of the excavations and research is reconstructed by Baldelli 1996. In all these articles, however, is forgotten Colini (1915, 67, n. 1), almost prophetic about the results of the digs carried half a century later. For the chronology of the necropoleis and relations with the other Villanovan centers, in the absence of the publication and complete study of the former, instead, as well as Drago Troccoli 2003, Peroni 1992 remains fundamental. His work is the result of accurate and highly competent sampling of grave goods and individual objects, particularly from the necropolis of Misericordia, selected at Ancona, not only from the National Archaeological Museum, but also from the annexed deposits. Of great interest, finally, Montali 2006, summary of a first exemplary work of analytic (and also graphic) documentation and reconstruction of the archaeological reality completed as far as possible: her work, limited to only one sector of the Misericordia necropolis, remains to be published in its entirety and systematically extended to the rest of Ferman necropoleis.

3937 To limit oneself to the essentials: Lollini 1976; Naso 2000; *Eroi 2001; Atti Ascoli Piceno – Teramo – Ancona*.

3938 Pallottino 1984, 150, actually defines it as an ‘island’ for this reason. For the distance from Verucchio see above Introduction, and for a critically conducted comparison between the two centers von Eles 2008, 204–217, 225.

3939 Less so by sea: see further ahead in this text.

3940 The fragments of biconical vases from the inhabited area of Belmonte (Dall’Osso 1915, 112; cf. von Duhn 1939, 219; Baldelli 2000b, 45–6; Peroni 2005, 736), not far away, remain undocumented and should be considered by now irremediably lost; but Dall’Osso’s knowledge of the materials of this type was deep, direct and at first hand, acquired at the Museum of Bologna, where he worked for many years. Further south, now in Abruzzo, the concentration of eight lozenge belts in the necropolis of Salino and the other elements of Tyrrhenian–Villanovan provenance (Lucentini 2009), added as far as Campovalano (Grassi 2003, 491–92, fig. 2, tab. Ia), continue to appear to be an isolated instance and without much connection to Fermo, at a period when, in the whole intermediate territory, the Early Iron Age remains known only from sporadic objects or some isolated Picene tombs (Baldelli 1982, 143–44, nn. 6–7; Lucentini 1995, 27–30, 41, figs. 8 e 14; Bergonzi 2000, 34–5). On the relatively numerous lozenge belts from Fermo and from other findspots of the region, see here footnote 30.

3941 The northern Etruscan votive small bronze, portraying Minerva and accredited with a provenance from Fermo (Richardson 1983, 348, no. 2, figs. 824–26; Cristofani 1985, 280, no. 90), actually comes from the Fermo ancient collection belonging to the De Minicis brothers, which was rich in materials acquired from throughout central Italy: cf. Baldelli 1996, 18, n. 9. Without a possible reference to an archaeological known context, near Fermo, remain also the other north Etruscan votive statuette of the Danish National Museum (Richardson 1983, 75, no. 6, fig. 876), said from the locality of Porto San Giorgio and datable around the middle of the sixth century BCE.

3942 Such as Montegiorgio (von Duhn 1939, 233–36; Seidel 2006, 156–60) and then, attested only from the sixth century BCE, still in the vicinity and forming a circle, also Sant’Elpidio a Mare (Ritrecina 2010, 45–6), Montegranaro (Jacobsthal and Langdorf 1929, 93; Lucentini 1999, 171, n. 66), Rapagnano and Torre San Patrizio (Baldelli 1998, 109; but earlier von Duhn 1939, 236–37), Grottazzolina (Lucentini 2004, 2005), Monterubbiano (von Duhn 1939, 241) and Torre di Palme (Baldelli et al. 2003, 341–47), but in the latter with the important difference of the frequent presence of large rings with six knots.

3943 Unlike Verucchio, but as in the entire Ascoli province: Bergonzi 2000, 36–7.

3944 Cf. Baldelli (1996, 15, n.4), which remains as stated without further proof.

3945 Few fragments of Middle/Recent Bronze Age, recovered on the summit of Giralco, and the neighboring contemporary sites of Monte Urano and Marina Palmense (Baldelli *et al.* 2005, 566–67, 569, 571) suggest that more intense archaeological exploration could modify the actual state of knowledge.

3946 Peroni 1992, 21 and 23; Camporeale 2000b, 104; Drago Troccoli 2003, 36–8. All with references, among the other centers and above all for the earlier phase, at Chiusi.

3947 About the Misericordia necropolis see Montali (2006, 190–91, nn. 21–2), who forgets tomb 10E/1956 at that necropolis (Baldelli 1996, 23; 1998, 59) and the Mossa tomb 15 (Baldelli 1996, 33; 1998, 62). At the opposite extreme, the only one without any burnt earth and important because it is among the earliest, Misericordia tomb 42D/1956 (Baldelli 1996, 25).

3948 In this necropolis is found tomb 15 (Baldelli 1996, 33), the earliest among the few now datable. Drago Troccoli (2003, 38, n. 28, 47–8) attributes it to the passage to the successive phase, but he places before it tomb 3, of a baby of a few months (cf. Baldelli 1996, 32).

3949 37D/1956 (Montali 2006, 218, 240–41, n. 22).

3950 For one of the numerous examples seen at Mossa and for others noticed at Misericordia see respectively Baldelli (1991b, 19, fig. 9, with multiple laying down) and Montali (2006, 191, 219), whose list, once again all of only female burials (apart from one, but damaged and dubious), does not include tomb 121Sm/1957 (Baldelli 1996, 29–30). Similar preparations are referred to the Picene necropoleis of Offida (von Duhn 1939, 250), Spinetoli (von Duhn 1939, 253), and Cupra Marittima and Grottammare (Dall’Osso 1915, 182, with notification also of very rare nailed coffins). Interment inside tree trunks or in real coffins, as in Latium (cf. Drago Troccoli 2003, 48–50, n. 94), are not attested at Fermo; the case of Matelica, pointed out by Montali 2006, 191, is isolated and should anyway be considered separately.

3951 This use then spread during the second phase (Drago Troccoli 2003, 50, 69, 74, figs. 8, 23/3–4; Montali 2006, 220), also in the incineration pits (Drago Troccoli 2003, 56, 61–2, figs. 11/3, 14/1; Montali 2006, 191).

3952 10S/1956 (Baldelli 1996, 26; Drago Troccoli 2003, 45–47). To minimize slightly Montali's perplexity (Montali 2006, 189, n.16 and 218, n.103) over the dating, account should be taken that the later date suggested by Baldelli (1998, 61) had taken place ten years before publication (Percossi Serenelli 1998, 6).

3953 Baldelli 2000c, fig. 76; Drago Troccoli 2003, 45–6, fig. 6D.

3954 Compared to what was hypothesized in Baldelli 1996, 20.

3955 The unpublished documents of the excavation assign to it, apart from the spindle (feminine gift?) and the helmet already known, a second weapon (an iron dagger) and perhaps part of a third (bronze spear butt), an impasto vase with geometric ornamentation and – in bronze – a little basin (for drawing water from the vase?), a razor, a '*forcella*', a spit, a little button, three small twisted rings, and three fibulae.

3956 Baldelli 1996, fig. 2.

3957 Lollini 1990, fig. 7; Iaia 2005, 76–7, no. 19, fig. 20. Another example from the same necropolis (Iaia 2005, 92–3, no. 40, fig. 30) is ascribed to the destroyed tomb 74S/1957 (cf. Baldelli 1996, 27), unfortunately the only find that can be attributed to it.

3958 Iaia 2005, 65, 131. According to Mario Torelli (1990; now in Torelli 2011, 69–70), the models of the weapons still carried at Rome by the *Salii* in the first centuries BCE, as elements of the ancient *vestis regia* or *triumphalis*, can be identified in such helmets just as well as in bronze breastplates and swords of the types found at Fermo in the Misericordia tomb 78S/1957 (Baldelli 1996, 28; Fig. 77.3). As *Salii's encheiridion* (Dion. Hal. *Ant. Rom.* 2. 70. 3 and 5), predecessor in the more remote age of the *sceptrum* or royal *scipio* (cf. Torelli 2011, 70), it may not have been unlike the axe, which is, for example, in the right hand of the bronze statuette of Ripatransone with a crested helmet (*Eroi* 2001, 232, no. 360).

3959 In the Mossa necropolis, apart from tomb 51 (Baldelli 1991b, fig. 9), we can date to the second phase of the Early Iron Age, according to Lollini (in Corrain and Capitanio 1972, 23, 26–8), the two-body tombs 6 and 11. The second is probably a family tomb and has – the only case of a mixed ritual – a cinerary urn of a third adult, male and not old. For the two-body and three-body tombs at Misericordia, of which at least that already in the Museum of Ancona is datable between the eighth and seventh centuries BCE, see Baldelli 1996, 20. This funerary usage is also particularly part of the Picene culture – cf. for example tombs 4 Via Diaz (Landolfi 2009, 50), 14 Fabiani and 8 Campodonico at Sirolo (Baldelli and Lollini 1998, 95–8), 2 Mossa of Fermo (Baldelli 1996, 32), 16, 21 and 46 Curi at Belmonte (Dall'Osso 1915, 33, 67–8, 89, 152–53), at Montegiorgio (von Duhn 1939, 233–34) etc. – but not for the earlier phases when, apart from at Fermo and Novilara (cf. Beinhauer 1985, 31), the usage is also known in Lazio (at Crustumium, Tivoli, Osteria dell'Osa, Decima, Ardea etc. — cf. Landolfi, forthcoming).

3960 Other known single examples (Montali 2006, 191–92), only from Misericordia, tombs 7S/1956 and 19S/1956 (Baldelli 1996, 25–6), IB/1956, 19Alidori/1959, 19R/1957 and 41D/1956, among them the last two, as Drago Troccoli (2003, 48, 80) emphasized, belonging to armed men. For such a use elsewhere see Lollini (1976, 118, 122, 125), who regards them as typically Picene, and Beinhauer (1985, 49), who apart from Novilara points it out at Cerveteri and in Istria.

3961 But, it seems, less distinct from the rest of the community compared with Etruria (cf. Montali 2006, 234–35). To the dominance of this same rank certainly belongs the pit tomb with walls and false cupola in stone, found unfortunately already looted in the Mossa necropolis and for which de Marinis (2000) refers to northern-Etruscan examples.

3962 Misericordia tomb 78S/1957: Baldelli 1996, 28. Misericordia tomb 63Q/1957: Baldelli 1996, 27.

3963 Baldelli 1996, 23; 2002c, 27.

3964 Baldelli 1996, 29–30.

3965 For all of this see Lucentini 2009, but with the following clarifications: the belt buckle shown only in a photograph from Dall’Osso (1915, 137) is that of the Fermo Museum (Lucentini 2009, fig. 5/2), given by a landowner of Misericordia (Baldelli 1996, 18–19). The other, found in 1911, certainly comes from tomb 7 (Baldelli 1996, 20–21), a two-bodies tomb, or, better, female, but with a male then placed on top (with a bronze helmet of Picene kind, javelin, and two iron daggers), probably badly preserved and even worse excavated: the description in the excavation documents — with the belt ‘on the knees’ — ignores the fragment of ‘pre-Certosa’ fibula (a clear addition perpetrated in the museum) and corresponds perfectly to the contemporary photographic evidence gathered by Lucentini (2009, fig. 6), who trusts himself too much to the sequence of objects in the *Inventario vecchio* of the Soprintendenza as proof of the association between them. From Numana von Duhn (1927, 136; 1939, 194), differently from Randall-MacIver (1927, 127, n. 1), knows of a single lozenge belt, evidently that already described by Dall’Osso (1915, 262), who gives no details of either the site or the means of acquisition. Finally, in the north of the region, the fragment believed to be of a belt from Sant’Angelo in Vado, instead belongs to a ribbed pail (cf. Monacchi 2004, 136, fig. 46).

3966 Peroni 1992, 26.

3967 Agostini 1987, 91–92.

3968 Baldelli 1982, fig. 1.

3969 Surprisingly Boullart (2003, 164–65; 2005) gives only a fleeting hint of the dimensions of the inhabited areas, which can, however, be easily reconstructed on the basis of geomorphology and the displacement of the necropoleis. For some examples from the area to the north of Fermo cf. the maps in Mambelli et al. 2005, figs. 1/A–2.

3970 Most recently Bartoloni (2012, 92), with reference also to Fermo.

3971 The difference is clearly pointed out by Mambelli et al. (2005), who indeed apply it also to Fermo.

3972 Agostini 1987, 89.

3973 With its extent compared to that of Villanovan Fermo: Peroni 1992, 26, fig. 12.

3974 See above **chapter 76** von Eles.

3975 For Veii: Bartoloni 2012, 91–92; Camporeale 2008, 17.

3976 As happens, for example, at Bologna in the first half of the eighth century: Sassatelli 2012, 163.

3977 Pallottino 1963, 44; 1977, 147; 1984, 56, 150–51.

3978 Most recently Capriotti 2010.

3979 Lollini 1976, 160.

3980 The link between the spread of the Cupra cult and Villanovan urns found in the Marche was already in von Duhn (1939, 247), where Fermo’s absence from the list of localities is simply forgetfulness (cf. in fact, von Duhn 1939, 239). Of the goddess, whose Umbrian-Sabine relevance is however confirmed, even if the theonymic basis gave the *gentilicia* names as much Latin (*cuprēnus*, but at Gubbio: *CIL* XI 5854) as Etruscan (*cuprna*, at Chiusi: *ThLE* 118), Colonna (1993, 23–25) has documented the assimilation also to the Etruscan *Mlacuch*, carried off by Hercules on a famous mirror from Atri examined in the article. On Cupra see recently Calderini 2001 and Betts 2013, both of whom we cannot always share due to the amount of conjectures; more synthetic and interesting the point made by García Ramón 2016. For a hypothesis of the geographical placement of the sanctuary, which must have existed in the territory of the *Cuprenses cognomine Montani*, and for tracing back to it the bronze statuette of Hercules from Castelbellino and the Picene necropolis itself of the same locality: Baldelli 1995a; 2003.

3981 First Torelli 1986, 24, 32.

3982 Veio for Torelli 1986, 32; Orvieto or perhaps Chiusi, but less determinedly as possible mother countries in the true sense, for Bartoloni (2012, 95), in the footsteps of Drago Troccoli 2003, 78. But, more cautiously, Pallottino (1984, 56) limited himself to writing of the spread of a ‘Villanovan model’.

- 3983** A review of the proposed solutions in Naso 2000, 69–72.
- 3984** Peroni 1992, 25–26.
- 3985** Sassatelli 2008, 77–80.
- 3986** Colonna, in Camporeale 2008, 24, n.67; but earlier Baldelli 1996, 16; 2000c, 59.
- 3987** Colonna 1993, 7–8, n. 27. His reference is to the presence, not to the foundation, which he judges earlier and, insofar as attributed to the Etruscans, only ‘asserted’ (cf. Colonna 1993, 10). This escapes Sassatelli (1999, 86) who in a note offers a hypothesis on the Picene origin of the sanctuary, suggested to him by M. Torelli and not at all incompatible with Colonna’s analysis.
- 3988** Colonna 1993, 10–13, nn. 27 and 34, figs. 2–3.
- 3989** Camporeale 2000a, 63; Sisani 2009, 114. Less obvious Naso 2000, 243.
- 3990** There is evidence, with very full reference bibliography, of a good part of the contributions in *Atti Ascoli Piceno — Teramo — Ancona*. The general treatments given to the theme are brief and mostly unsatisfactory (Lollini 1976, 159–61, 169; Landolfi 2001b). Marconi (1935), with his consciously cultural-historical approach, inspired by the principles of the Vienna School of Ethnology, is by now dated, but was first to have the merit of considering the trade with Etruria (essentially Tyrrhenian) and its influence and export — as well as that which came at the same period by sea from the Greek and Near Eastern world — as fundamental to the very formation and development of Picene civilization.
- 3991** Colonna 1992, 2001.
- 3992** Baglione 2001; Camporeale 2003; for the later period also Ambrosini 2003.
- 3993** Gentili 1992; von Eles 2008, 216–24. For the provenance of the two bronze censers from Novilara see Stopponi 2003, 395, fig. 1.
- 3994** Recently Silvestrini and Sabbatini 2008. Mainly on these latest discoveries Riva 2003; 2005; 2007 (*non vidi*).
- 3995** On these and the unnoticed destructions which probably largely obliterated them see also most recently Sabbatini 2009.
- 3996** Unfortunately the results of the 2010 first test diggings in some of the many ring-shaped ditches of Acquaviva di Cagli, unexpectedly containing a dwelling structure right inside, have weakened the hope (cf. Baldelli 2008, 251–52), at least for the moment, of seeing the route of spread of this submontane orientalizing *facies* rising even further to the north.
- 3997** von Duhn (1939, 202) described the grave goods of Fabriano as of ‘mixed culture’, that is, Umbrian-Etruscan, and would undoubtedly have applied the same definition also to the grave goods of Matelica, if not directly to those of San Severino.
- 3998** The orientalizing signs in the rest of the region and along the Adriatic coast seem less strong.
- 3999** Stopponi 2009, 128.
- 4000** Nothing comparable, as far as we know, not even in centers at a greater distance such as Foligno, Campello, and Spoleto, where a number of similarities in materials are found.

- 4001** See Allegretti 1987.
- 4002** In this way, but for a later period, Colonna 1992, 16–20; 2001. Also other activities, such as pastoral farming, stock-rearing, and work in the fields and in the first cities in the course of their growth, could sometimes be the cause of people movement.
- 4003** Piceno IVA of Lollini 1976, 137–50.
- 4004** von Duhn 1939, 195.
- 4005** Colonna 1980, 44–49; Baldelli 1991a, 100, n. 2.
- 4006** Baldelli 2002a, 76–79; 2010, 595–96 with bibliography and discussion. In the second of the works cited we need to add to the list of Etruscan bronze torch holders at least that, lost, from a tomb of Acquaviva Picena: cf. Baldelli 1995b, 52–53, n.16.
- 4007** Lollini 1976, 160.
- 4008** So, recently, Colonna 2008, 43, n. 25. A different viewpoint is, however, attempted in Baldelli 2002a, 74–79, with reference to earlier contributions.
- 4009** Insufficient as they are, in that they did not necessarily require to be read, the graffiti from San Costanzo, similar to alphabetic signs, are on two plates of grey pottery (De Sanctis 1992, figs. 3–4), probably imported from the Po area. The inscriptions of Novilara, apart from one only, have been declared modern fakes by Agostiniani (2003), but because of the northern Etruscan alphabet at their base Colonna (1985, 54–6) had anyway earlier excluded ethnic implications.
- 4010** Devoto 1967, 229; Devoto and Buti 1974, 79, 87.
- 4011** From an earlier *Rasēnus*: Baldelli 1991a, 100, n. 2.
- 4012** Colonna 2008, 50–52; cf. also Calderini 2001, 81.
- 4013** Benelli 1994, 13–15; 2007, 175–76; Haack 2006, 38–40, no. 18; cf. also Marengo 2010, 36. The inclusion among the funerary inscriptions is almost unanimously agreed.
- 4014** Differently: Colonna 1984a, 173–76; Morandi 2006, 16 (but cf. 23).
- 4015** Coen 1998, but with doubts on the ethnic origin of the women who wore it.
- 4016** Only brief mentions in Landolfi 1985, 450–62; 2001a, 176; 2001b, 219. For an excellent summary cf. also Shefton 2001, 155–56.
- 4017** Most recently by Brizzi 2008, 22–24.
- 4018** *TLE* 694; Landolfi 1985, 451, n. 11. The re-contextualizing of the helmet, disappeared after the unfortunately bad photo published by Giorgi (1954, fig. 16.1–3), was already in Baldelli 1977, 278, n. 4. Later he supposed (Baldelli 1986, 10) that we are dealing with a loot ending up in a tomb, unknown just like the other grave goods (cf. Brizio 1901, 642–43), of a Senone (Kruta 1981, fig. 1; Landolfi 1985, fig. 2; Schönfelder 2010, fig. 1) or indeed of an Umbrian (Reinecke 1940, 42). Sisani 2007 offers no hypothesis on the nationality.
- 4019** Sisani 2007, 111.
- 4020** Colonna 1984b; *REE* 74, 2008, 406, no. 161. Sisani (2008, 52) classified it as imported item, as the bronze mirror perhaps from Fabriano, published by De Puma 2005, 66–68, no. 49.
- 4021** Belfiore 2012, with reading of the name *G(aios) Tusno(s)*, which has to be corrected in *G(aius) Tusnus*. On the necropolis see earlier Baldelli 2008, 249.
- 4022** de Marinis 1986a, 52–5, figs. 15–16; 1988, 107–8, figs. 112–3; 1999a, 604–11, figs. 1–2; 1999b, 537–48, figs. 17–18; Egg 1992, 154–6, fig. 4.2; Gleirscher 1993–1994; Gambari 1999, 13–5, figs. 4–5. About the crested helmet from the Tanaro River near Asti see Gambari 2000.
- 4023** In the case of Golasecca culture, “proto-urban” centers took the form of clusters of interdependent villages distributed over a relatively large area.
- 4024** de Marinis 1975, pl. XIV B; 1988a, 178–9, figs. 146–7; 2001, 50, fig. 8; Colonna 1986, 159, fig. 21.
- 4025** de Marinis 1999a, 611–6.
- 4026** Bertolone 1956–1957; Kossack 1956–1957; de Marinis 1988, 179–80, figs. 150–2; Pare 1992, pl. 132B.
- 4027** Fischer 1979, 128–9, pl. 9.2, pl. 21; Chaume and Feugère 1990. Updated map showing

the distribution of the flat ribbed bowls in de Marinis 2014, fig. 12.

4028 According to Bianco Peroni 1976, 37.

4029 The knife is published in de Marinis 2001, fig. 9; 2010a, 42, fig. 8.6.

4030 See de Marinis 1986a, 57–60, figs. 20 and 22 (top).

4031 See de Marinis 1975, 220, pl. III; 1988a, fig. 159.

4032 Colonna 1988, 155–7, pls. XLVI–XLVIII.

4033 About the tomb, see Gambari in *Etruschi a nord del Po*, I, 81–4, figs. 33–35; de Marinis 1988, figs. 163–165. For the *Rippenziste* see also Stjernquist 1967, no. 101: 1, pl. XXII, 2, pl. LVI, 2, 4. The pin can be recognized in a photograph of the Castelfranco archive: see de Marinis 2009a, fig. 12.

4034 See de Marinis 1986a, 60, fig. 22 (bottom); Colonna 1986, 140–1, fig. 11; Prosdocimi 1989.

4035 The find is still unpublished.

4036 Gambari 2011, 19 and fig. 3. Gambari reads $\chi[\acute{o}]\theta\iota[o]\varsigma$ or $\chi[o]\theta\iota[o]\iota[--]$. The reading is not sure.

4037 The reading “*pris-*”/“*brigs-*” indicates a well-known theme with a Celtic root, present in the name of Brixia (now Brescia), the capital of the Cenomani. The context refers to the seventh century. See Verger 1998.

4038 The inscription is difficult to read. Sassatelli 2000; de Marinis 2009b, 423–5, figs. 12–13.

4039 Colonna 1986; de Marinis 1991–1992, 206–11, fig. 3; 2009c.

4040 Colonna 1986, 152; 1988.

4041 Cattaneo 1995, 46–50.

4042 de Marinis 1986a, 61, fig. 23; Colonna 1986, 157–8.

4043 Cattaneo 1995, 43.

4044 Most of the seventh-sixth century materials from Remedello Sotto, kept in the G. Chierici Museum in Reggio Emilia, is still unpublished. See de Marinis 1986a, 61–5, 85–6, figs. 24–25, 26.1 and 4, fig. 36; 1999b, 548–51, fig. 21.

4045 de Marinis 1984, 20–1, fig. 6.

4046 De Amicis, Marchetti and Ravazzi 2011; Deaddis, Margaritora, Perego, Ravazzi, and Zanon 2011; Ravazzi et alii 2011.

4047 The formation of the lake of Bagnolo is likely related to the flood of Guastalla, which occurred at the beginning of Sub-Atlantic period, and led to the abandonment of the branch of Bondeno (active during the Bronze Age) and caused the so-called Po Vecchio to become active (which continued after the confluence of the Mincio as Po of Adria).

4048 de Marinis 1991, 75–85.

4049 de Marinis 1986a, 140–150; de Marinis 2007, 25–34.

4050 Hummler, Carver 1986; Casini, de Marinis, Fanetti 1999; Casini and de Marinis 2007, 35–8.

4051 Today it is not as clearly visible as in the early 1980s, due to the leveling caused by agricultural works.

4052 de Marinis 1986a, 120, fig. 47 no. 241; 2007, 56–9.

4053 Maggiani 1998; Frontini 1986, 286, fig. 176.

4054 de Marinis 1986a, 119, fig. 47 no. 240; 2007, 56, fig. 21.1.

4055 de Marinis 1986a, 282–4. Many finds are still unpublished.

4056 de Marinis et al. 1994; de Marinis 1986a, 156–162; 1992, 241–2, 251–5; Casini and de Marinis 2007; Casini, Longhi, Rapi 2007; de Marinis 2010b.

4057 Casini and de Marinis 2007, fig. 12.

4058 For a preliminary report see de Marinis 1992, 2010b; de Marinis et al. 1994; Casini, Longhi and Rapi 2007; Rapi 2007, 95–110. The finds relating to the honey collection are still unpublished. By means of scanning microscope you can see the remains of the bees in the cells. New data on the Greek pottery from the F I and F II houses in de Marinis 2016.

4059 A comparison can be done with the houses in the southwestern corner of the Heuneburg period IVc (Gersbach 1995). Although these structures are older than the phase F houses of Forcello, they could still go back to a model of Mediterranean origin (Quirino 2011).

4060 de Marinis 2010b, 103–7, figs. 7–9; Wiel Marin 2011, 393–9.

4061 See de Marinis 2007b, figs. 109.4, 111.1, 113–117.

- 4218** Camporeale 1969, 29, pl. 3.1–3.
- 4219** Camporeale 2007, 42–45.
- 4220** Analyses of the finds from southern Switzerland show that nearly 90 percent of the amber is from the Baltic: Beck and Stout 2000.
- 4221** Malnati 2007.
- 4222** In this sense it is probably more than pure chance that the tomb lies not far from the Main, which blocks the route to the north.
- 4223** Jockenhövel 1974; Iaia 2005, 163–69.
- 4224** von Hase 1992, 243f., 258f.
- 4225** Krausse 1996, 269–73.
- 4226** Frey 1989, 298, 300 fig. 2.2 (*Schnabelkanne*). On the ribbed cist: Stjernquist 1967, 58f. nos. 97, 98. On ribbed cists in general: Micozzi 2001a; 2001b; Dehn et al. 2005, 165–78.
- 4227** Frey 1989, 298, 300 fig. 2.1
- 4228** Trans-Adriatic contacts must especially be responsible for the conveyance of the two pearl dishes from Vače and Magdalenska gora, which find their closest parallels in central Italy: Krausse 1996, 273. A dish that is not entirely typologically equivalent comes from Nesactium: Krausse 1996, 430 no. 262.
- 4229** Lucke 1962, 62–66 no. 7 fig. 8.17, pls. 23–26, 65.
- 4230** Lucke 1962, 56. From the extensive recent literature on situla art we mention only Zaghetto 2002; Zaghetto 2006; and Huth 2003.
- 4231** Este, Morlungo: Find from a disturbed tomb: Capuis 1993, 204; Tombolani 1988, 148–49 no. 694. On *Schnabelkannen* in general: Vorlauf 1995.
- 4232** Frey 1969, 44, 83–84, 86, 98, 105, pl. 28.15; 67. We may also mention the bronze figurine of a nude worshiper from Padua, who holds a *Schnabelkanne* in the left hand and an *omphalos* dish in the right: Frey 1989, 301–2 fig. 3; Capuis 1993, fig. 57.
- 4233** Egg 1996, 14–51.
- 4234** Relevant models are works like the warrior figurine from Este, Scolo di Lozzo, that probably came from Etruria, and which in its attenuated, scarcely articulated body closely resembles the figures from Strettweg: Capuis 1988, 91, 93 no. 177; Huth 2003, 239 pl. 87.1.

- 4235** According to a recent book by Luisa Bertacchi, Aquileia would also have been an Etruscan foundation (Bertacchi 2009). The thesis is based on a group of fifty-eight Etruscan vessels of unknown provenience that was handed over to the author under dubious circumstances, but since to date no Etruscan pottery from secure contexts is known in Aquileia, an Etruscan origin of the city remains highly doubtful.
- 4236** Gamba 1986; Bonomi 1988; Bonomi 2000; de Marinis 2005; Wiel-Marin 2005; Lenzi 2007–8. Two *aryballoi* of the late proto-Corinthian and Italo-Corinthian styles from Este precede the phase dealt with here: Este, Rebato, Tomb 100: Favaretto 1976, 44, pl. 20.1; Lenzi 2007–8, 86, pl. 15a; unprovenienced, Vienna, Naturhistorisches Museum: Frey 1989, 297 n. 35; Woldrich 1978, 39–40, 207. On the two vessels also: Capuis and Chieco Bianchi 1992, 70 fig. 54, 106 n. 66; Bruni 1998, 205 with footnote 15. For Lombardy see **chapter 78** de Marinis.
- 4237** Wiel-Marin 2005, 139f. fig. 63.
- 4238** Bonomi 1991, pl. 1.1–3.
- 4239** Pierro 1984, 143–52; Iacobazzi 2004, 215–17.
- 4240** Cavada 1990, 26f., 34f. figs. 2–3.
- 4241** Only a few representative examples need be mentioned: Bonomi 1991, pl. 37.3–5; Wiel-Marin 2005, 248f.
- 4242** Åberg 1931/32.
- 4243** von Merhart 1952.
- 4244** Müller-Karpe 1959.
- 4245** Simplified core-periphery model: Sherrat 1993; erroneously on the spread of iron technology: Vandkilde 2007; cf. Delpino 1988.

4541 Buccherio and bronze *kantharoi* in Greek sanctuaries have been examined by Naso 2009a, with previous literature.

4542 Naso 2006b, 191 fig. 8 with literature.

4543 Cristofani 1996 comments on the inscription from Aegina; Colonna 2007 publishes as Etruscan the inscription from Perachora and suggested possible restorations for the inscription from Aegina (220 footnote 48).

4544 Briquel 1998; d’Agostino 2000.

4545 Jacquemin 1999, 335 no. 303 (stone base), 309 no. 012 (treasure of Caere), 352 no. 443 (treasure of Spina).

4546 The literary sources are collected and discussed by Briquel 1984, 3–30 (Spina), 169–224 (Caere). Naso 2013 for the treasure of Spina.

4547 Colonna 2000.

4548 Naso 2006a, 402–6 lists the Etruscan folding chairs, completed by Naso 2014b.

4549 Literary sources are collected and discussed by Mansuelli 1984; for the archaeological evidence see Naso 2006a, 380–97 (*infundibula*); 2009b (incense-burners).

4550 Siewert 1991, 81–82 nos. 4 (cauldron), 5 (*oinochoe*), 6 (basin?), 7 (*infundibulum*: inv. no. B 4574).

- 4551** Poll. *Onom.*, ed. Bethe 1900–1931: 7.86.9–7.87.1 (Etruscan sandals), 7.92–7.93.1 (thick sole); additional Greek literary sources are listed by Naso 2009b, 642. For the finds from Campovalano: Zanco 1989 (sandals); Boccolini 2003 (tomb group). I am not certain whether or not some sandals from Greek findspots are really Etruscan, as suggested by Touloupa 1973 and recently by Frankenhauser and Weidig 2014.
- 4552** Weber 1990.
- 4553** Martelli 1988–89, 17–20 for the shrines. It must be noted that the Achelous mask from Olympia, mentioned by Martelli (20 n. 44), to be identified with Olympia, Archeological Museum, Inv. no. M 880, is certainly of bronze cast and probably not Etruscan.
- 4554** Johnston 1985; 2006.
- 4555** Tosto 1999. The more widespread *pyxides* from the same workshop have been found in both Etruria and Greece (Lyons 2009).
- 4556** Malagardis 2007.
- 4557** The various opinions and interpretations of this tiny sherd are collected by Naso 2014a, to be supplemented with Maggiani 2011, 217, fig. 7.
- 4558** Pallottino 1963; MacIntosh Turfa 1977; Morel 1981, 1990; Thuillier 1985; von Hase 1989; 1993; Naso 2006; Gran Aymerich 2009, 22–28; Naso 2010.
- 4559** Venturoli 2002, 36–37, no. A' 43.
- 4560** de Marinis 1999, 542–47.
- 4561** Delpino 2002; Lo Schiavo 2005.
- 4562** Monchambert et al. 2013, 48–50, no. 20a–b, fig. 44; Ferjaoui and López Castro forthcoming; López Castro, forthcoming.
- 4563** von Hase 1989; Docter 1993, 229–30 nos. 23–24.
- 4564** Naso 2006, 189, figs. 3–4; 2010, 80 nos. 26–27, figs. 2–3.
- 4565** Prins de Jong 1925, 55–56 no. V. 2, pl. 3 (top right).
- 4566** Burkhardt 1991, 114–15.
- 4567** Long and Sourisseau 2002, 30.
- 4568** Naso 2009.
- 4569** All Etrusco-Corinthian vases from Carthage are listed in Naso 2010, 79 no. 8.
- 4570** The so-called Zita trade amphorae, which Roald Docter considered to be also of Central Italic origins (Docker 1998), are now definitively attributed solely to Sardinian production by Oggiano 2000, 241–42.
- 4571** Different opinions, however, have been expressed about Malcus and his enemies (Bernardini, Spanu and Zucca 2000; Krings 2000).
- 4572** Ampolo 1987, 80–84; Scardigli 1991, 47–87.
- 4573** Colonna 2010, with previous bibliography.
- 4574** Maggiani 2006.
- 4575** Berges 1997, 52.
- 4576** Perkins 2007. All the sherds have already been listed (Naso 2010, 79 no. 2 for Tipasa, 80 nos. 28–32 for Naucratis, 80 no. 34 for Karnak).
- 4577** Zuffa 1960.
- 4578** Naso 2015, nos. 1–94, with previous literature.
- 4579** Maggiani 2003.
- 4580** Tagliamonte 2004, 161 footnote 103. Gianluca Tagliamonte is working to an edition of these cuirasses (Tagliamonte 2014, 181).
- 4581** Naso 2010, 79 no. 16 (at least six Genuclia plates from Carthage) and no. 23 (one Genuclia plate from Cyrene).
- 4582** von Hase 1996; Bénichou-Safar 2004, 179 pl. XLIX, 9.
- 4583** Briquel 2006 on this inscription, with previous literature.
- 4584** Maggiani 2007 and now Belfiore 2010 for various aspects of the inscription. Srdoč et al. 1990 suggest a radiocarbon date, which few scholars accept.
- 4585** Colonna 1983, 1–5. See also [chapter 38](#) Torelli.
- 4586** Respectively Py 1995; Cristofani 1983 and Boulomié 1992; Colonna 2006.

- 4587** Gras 2004.
- 4588** *Atti Marseille*.
- 4589** Landes 2003; Long, Pomey and Sourisseau 2002.
- 4590** Morel 2006, 23–45. He also recalls the mention in literary sources of Etruscan coins in southern Gaul.
- 4591** Morel 1981; Bats 1998; Py 2003.
- 4592** Py 1993; Garcia 2010.
- 4593** Bats 2006; Dietler 2010; Malkin 2011; Roure 2015.
- 4594** Janin 2006.
- 4595** Gras 2000.
- 4596** These objects may have come from the city of Tarquinia: Gras 2000.
- 4597** Gras 2004; Melli 2006; Paltineri 2010.
- 4598** Polanyi, Arensberg, Pearson 1957, 262.
- 4599** Py 1993.
- 4600** Garcia 2003, 31–45. The Launacian phenomenon corresponds to the native development of the production of metals intended for trade. This was an economic phenomenon, not a regional culture.

- 4601** Py 2003; Dedet and Py 2006, 121–44.
- 4602** Bats 1998; 2006.
- 4603** On the various kinds of amphora and their origin, see Py 1985; Herubel and Calledrat 2006, 161.
- 4604** The cargo, similar to the deposits in the region, might have been sailing to Etruria (Py 1993).
- 4605** Colonna 1980.
- 4606** Sourisseau, in Long, Pomey and Sourisseau 2002, 90; Colonna 2006, 662, footnote 6.
- 4607** Dedet et al. 2006.
- 4608** Colonna 2006. See also chapters 10 D’Ercole and 22 Pomey.
- 4609** Garcia 2010.
- 4610** Michel Bats interprets Massilia’s output as a necessity born of the crisis in the supply of Etruscan wine, and not vice versa (Bats 2006, 86).
- 4611** Py et al. 2006, 583–608; Dietler 2010. The graffiti suggest that at this time both Greeks and Etruscans lived at Lattes (Colonna 1980; Bats 1988).
- 4612** The lowest levels at Lattes, between the end of the sixth and the beginning of the fifth centuries, yield a quantity of Etruscan amphorae amounting to nearly 85% of this category, versus an expected 15–30% on the basis of nearby sites (Py 2003).
- 4613** Long, Pomey and Sourisseau 2002. The provenance of a ship and the origin of its crew are never fully clear (Drakides, Nantes et al. 2010).
- 4614** For this section on Etruscan imports in Gaul, see Frère 2006.
- 4615** Herubel and Calledrat 2006.
- 4616** From the very long bibliography, see De Hoz 1992, 264–65; Decourt 2000.
